EDITORIAL COMMENT

THE TUBERCULIN TEST

Every person who owns cattle should understand the limitations of the tuberculin test and know how tuberculosis may spread. Not infrequently do we get communications from breeders who have purchased cattle subject to the tuberculin test and a sixty-day retest, stating that upon application of the combination test two or three years afterward a large number of their herd reacted. Invariably such men do not understand the limitations of the tuberculin test or how healthy animals can be infected.

A short time ago a breeder wrote that he had purchased fifteen animals from a prominent breeder in another state. All of these animals were purchased subject to the tuberculin test and a sixty-day retest. One year later, one of the fifteen reacted. On this same farm there were 28 other cattle and eight of this number reacted to the test. Without doubt, the fifteen brought to this herd were all free from tuberculosis, but being associated on the same farm with animals suffering from this disease they became infected. It is not difficult in this case to point out the source of infection because it was on the farm, but the owner failed to make the connection and is inclined to hold the breeder responsible from whom he purchased the fifteen head.

Another breeder writes that he purchased nineteen head from a herd known to contain tuberculosis, but that none of those he purchased responded to the test, made at the time of shipping, or to the sixty-day retest, but one year from that time two of the animals reacted. He doubts now whether the tuberculin test is of any value. This man fails to take into consideration, even though only two of the nineteen head he purchased responded to the tuberculin test, that all of them had been exposed to the disease and that the test does not always reveal animals which have only lately been exposed or when the disease is in its incipiency.

Another breeder writes us that he purchased twenty-five animals that at one time responded to the test, but the owner claimed they were no longer suffering from the disease as they did not respond to the tuberculin test made six months ago. In testing these animals for shipment, none of them responded to the test. However, one year from that time, upon retest, five of them reacted to the subcutaneous test, and they all reacted to the combination test, which includes the ophthalmic and intradermal tests. Upon slaughter it was found that all but two had generalized tuberculosis.

The Bureau of Animal Industry holds that if an animal has once reacted to the test it is always a reactor. Last year the Bureau conducted experiments with 343 animals known to have tuberculosis, and upon retest 129 animals failed to react the second time. Upon slaughter and careful post mortem, it was found that the 129 had tuberculosis. It is highly desirable that men purchasing cattle should bear in mind the limitations of the tuberculin test, what it will do and what it will not do. If the tuberculin test were thoroughly understood and how infection spreads, there would be fewer disappointments in eliminating tuberculosis from herds.

FARM BUREAU AND CO-OPERATIVE MARKETING

The Butter, Cheese, & Egg Journal seems to have gotten off on the wrong foot in discussing the activities of the farm bureau and the U. S. Bureau of Markets. It speaks of the work of these institutions as being under the guise of a co-operative movement, and intimates that when their plans are fully developed the distribution of food will be carried on through government agencies and at practically no cost.

There is no foundation for such supposition or charges. It is not contemplated by the U. S. Bureau of Markets to do away with the legitimate distributors of food or to assume the role of the distributors, but it is attempting to improve our present system of marketing and to do away with the speculators. In this it has the hearty co-operation of the farm bureau. The officials and advocates of the farm bureau recognize the necessity of middlemen. This function must be performed by some one, but they also appreciate the necessity of improving our present system of marketing farm products.

Farmers have never been in a position to hold their products but have been forced to sell them at the time of harvest when prices, as a rule, are at their lowest point. This condition has given the speculator an opportunity to buy farm products at low prices and, after holding them, realize good margins. The purpose and object of the U. S. Bureau of Markets and the farm bureau is to establish co-operative enterprises whereby farmers will not be forced to sell a large portion of their crops at the time of harvest or in a rigid market. It is their purpose to place the producer in a position to take care of his own business and not be forced to take prices set by the speculators.

The Butter, Cheese, & Egg Journal asks: "Is it the theme of the farm bureau to establish socialism through a governmental department for one line of industry, thereby establishing socialism a step at a time?" We have not observed that either the farm bureau or the Bureau of Markets is attempting to establish socialistic principles in the marketing of farm products any more than the Wisconsin Cheese Federation is attempting to establish socialism in the marketing of cheese.

The cheese factories in the vicinity of Plymouth a few years ago built a large warehouse where their cheese could be stored and cured and shipped, when necessary, direct to wholesalers or retail stores. It was found, owing to the large production of cheese during the summer, that private corporations purchased cheese at a comparatively low price and sold it in the winter at a comparatively high price. There was nothing wrong about this. On the other hand, there is nothing wrong or is it socialistic for these cheese factories to have federated themselves together for the purpose of curing the cheese and holding it until the market will pay a better price. This is only good business.

The Bureau of Markets has no money invested in this enterprise and it is nonsense for any paper to say that people are being taxed to enable the government to engage in marketing farm products. The plan now under way is for farmers to provide their own funds and to build co-operative institutions whereby all farm products may be handled upon the same basis as the cheese federation is handling cheese.

McCANN AND THE LEAGUE

Can a leopard change his spots? If so, then possibly McCann may have reason to believe that dairy producers are of short memory and he can now come before them as a friend and counselor. But let us take up just one of the many and varied activities of this man who whines and cries out against the "nefarious" League and its officials, and then judge what his support or attack is worth.

In 1915 Alfred W. McCann, as a representative of Borden's and the New York Globe, visited a few creameries in Wisconsin and the Wisconsin Dairy School. After his visit he proceeded to write a series of articles regarding conditions under which butter is manufactured in Wisconsin and viciously attacked the creamery industry of Wisconsin, the Wisconsin Dairy School, and Professor E. H. Farrington, its head. He grossly misrepresented conditions and facts, and brought false charges against leading men in the dairy industry of Wisconsin.

We made editorial comment and printed letters from several responsible men denouncing the false charges which Mr. McCann made at that time. Professor T. L. Haecker of Minnesota, in a letter to Dr. H. L. Russell, Dean of the Wisconsin College of Agriculture, stated, "I have been astonished at the statements made by Mr. McCann, and I have often wondered whether the man was crazy or whether he thinks he can build up a business, for which he seems to be the advertising agent, by attacking other parties and interests. The statements attributed to me with reference to the Dairy Department of the University of Wisconsin are gross misrepresentations and are neither true in word nor substance."

Dean Russell, in commenting upon a letter to Mr. McCann written by Mr. Guy Speirs, president of the Eau Claire Creamery Company, states: "His disavowal of the repudiated conversation, which is reported by Mr. McCann, is indicative of the fact that Mr. McCann's statements cannot be relied upon."

Mr. McCann, through the New York Globe of December 22, 1915, attacked W. D. Hoard, then the editor of Hoard's Dairyman. He accused Mr. Hoard of duplicity because he spoke out in plain terms against Mr. McCann's unwarranted attack upon Professor E. H. Farrington. He tried to show the Senior Editor's duplicity by quoting one of his statements which he claims were made behind closed doors and before a congressional committee in 1913. Mr. W. D. Hoard did not appear before any congressional committee in 1913, nor had he been in Washington, D. C., since 1909.

This same Alfred W. McCann now comes out in the New York Globe of October 6, 1920, in an open letter to the Nestle's Food Company, condemning the New York Dairymen's League. In the light of his past history, how should honest men accept his most recent eruption when he charges the officials of this organization as making false statements and states they should be put in prison?

Mr. McCann now says: "How can the farmer be blamed for listening to this compound of Holy Writ and crap, when there is nobody to set him right, and when the columns of the Dairymen's League News are not open to plain statements of facts that would refute the falsehood or neutralize the deadliness of the poisoned pill which the farmer is asked to swallow?"

He condemns the contract which the Dairymen's League officials are asking the farmers to sign in order that they may be sure of receiving the farmers' milk over a period of time and that they may lay their plans accordingly. He charges the officials of the Dairymen's League with fraud and stupidity.

The purpose and object of the Dairymen's League is to place the farmer in control of his own business, giving him opportunity to have something to say regarding the price that shall be paid for his milk. We believe the officials of the League are earnestly trying to serve its members.

It is our advice to take no heed of the charges made by Mr. McCann, and we regret that any company or milk distributor would go to the pains of distributing an article written by him or would in any way associate themselves with a man who has proven himself a misrepresentor of facts and who has in times past been an enemy of the dairy industry and the producers of milk. There should be no controversy between the milk distributor and the milk producer. Each has a service to perform. A farm organization is committing no crime when it attempts to establish institutions and methods of selling the farmers' products to the best advantage. The milk distributor is committting no crime when he attempts to buy the farmers' milk as cheaply as possible. However, the farmer is unwise if he is willing to accept any price the distributor might offer and if he does not place himself in position to market his products upon the same basis as other enterprises.

We believe in the New York Dairymen's League. We have faith that it is to succeed. We do not question the sincerity of its officials. We are convinced that, with the past affiliations and history of McCann exposed, members of the League will be induced, by his harangue against their organization, to support it and to generally sign the pooling agreement. It is their protection. The crux of the whole question is, Shall the farmers of the

section supplying New York with milk put their trust in corporations which buy their milk or in their own organization, the Dairymen's League, which they created and over which they have supreme control?

Kind of Fertilizer to Use

Kindly advise what fertilizer to use on my small farm of ten acres. I keep no stock and farmers around here are too wise to sell manure.

Ogdensburg, Wis. L. D. M.

Where no live stock is kept it is the practice of good farmers and it is also recommended by our best soil authorities to use legumes, such as clover, soy beans, alfalfa, etc, to keep up the nitrogen and organic supply of the soil.

On Hoard's Dairyman Farm we raise alfalfa and keep each field in this crop three, and sometimes four, years and, when it is broken up in the fall, the fourth crop will be from a foot to 18 inches high. It has been our practice to apply 1,000 lbs. of rock phosphate per acre, as we feel that the manure which we return to the land does not keep up the supply of phosphorus.

It may be said, as a general statement, that the lands which have been cropped for a number of years lack in the element phosphorus. Some are lacking in nitrogen and potash also, but as a rule our upland soils contain an adequate supply of potash, and, if live stock is kept or legumes grown, the nitrogen supply is sufficient.

While rock phosphate furnishes phosphorus cheaper than acid phosphate, we would not advise its use unless applied with barnyard manure or plowed under with some legume crop, such as clover, alfalfa, or soy beans, unless the soil is very rich in active organic matter. It requires a decomposition of organic matter to liberate the phosphorus in the raw rock phosphate. For land deficient in organic matter, we would prefer to use phosphorus in the available form, such as acidulated bone meal or various other forms of phosphatic fertilizers known to contain phosphorus in the available form. It is the practice to apply from 250 to 300 lbs. of such fertilizer per acre and immediate returns may be expected.

The results of the Ohio Experiment Station from experiments carried on for nearly twenty years indicate that acid phosphate, even though it costs more, gives larger returns on money expended than raw rock phosphate. The Illinois Experiment Station has found raw rock phosphate to give better returns than acid phosphate. In our own experience we have used both forms of phosphatic fertilizer. Where it is desirable to have immediate returns we have used acid phosphate. When plowing under a green crop of alfalfa, we have used raw rock phosphate and in the amounts mentioned.

It will be found necessary on most soils that have been in use for many years to apply from one to three tons of ground limestone per acre, for they are acid and an acid soil will not grow either clover or alfalfa. The nitrogen-gathering bacteria which live upon the roots of these plants do not grow in an acid medium; it must be neutral or alkaline.

We would suggest that the soil be tested with litmus paper to determine whether it is sweet or sour. Litmus paper can be purchased from most any drug store. Take a strip about one-fourth inch wide and four inches long and place it in an opening in the soil that has been made by a spade and then press the soil firmly around it. Permit it to remain two or three minutes and then spread the soil apart and remove the paper. If the paper is red or pink, it shows that the soil is acid. This test can be applied to several parts of the field in order to determine how general the acidity of the soil is. If it is found to be acid, lime should be applied in the amounts stated after plowing. This permits the lime to work its way through the furrow slice, which is more acid than the soil underneath and it sweetens the soil where it is most essential. If it is desired to obtain immediate results from fertilizing, an application of 250 to 500 lbs. of acid phosphate may be used. The application of lime is highly essential on the land to be sown to some legume.

Our discussion so far is general, and it is not possible for us to be wholly specific without thoroughly investigating the farm, but we can say this much: The land to which legumes are sown should receive an application of a sufficient amount of lime to sweeten it, and, if there is reason to believe that the soil is low in fertility, an application of about 250 lbs. of acid phosphate per acre should be applied. It may be that some nitrogen and potash is needed, but before we would purchase either of these elements we would determine by a demonstration if it would be profitable to purchase nitrogen and potash.

An acre of land of average fertility can be used for this work, applying potash to one-fourth acre and nitrogen to one-fourth acre, to another one-fourth of an acre apply acid phosphate, and to the fourth, all three elements, nitrogen, phosphorus, and potash.

It may be said, too, that if the land is sour that most crops will be benefitted by an application of lime. In short, we would sweeten the soil and then apply 250 lbs. of acid phosphate per acre as a start. We would raise legumes on such fields as they can be sown for the purpose of securing nitrogen and organic matter for the soil. Let ground limestone and acid phosphate be the first fertilizers to use.

A rotation of crops should be established, which would bring in legumes as fast as possible, for soils which have been cropped for many years are invariably low in nitrogen and organic matter. The results of the demonstration plots that we have suggested will help direct the future purchases of fertilizers.

Ills of the Young Calf

Success in dairy farming depends to a great extent upon the careful rearing of the calves. Carelessness in breeding and calf raising is bound to result disastrously to a herd, or at least keep it at a standstill, as far as improvement is concerned. Without raising calves from which to replace discarded animals it is almost impossible to raise the average production of the herd. Purchasing cows for this purpose is a very unsatisfactory method. Cows placed on the market are almost certain to be of very ordinary grade, since a good cow whose value as a milk producer is known is not offered for sale at market price. Therefore, the dairy farmer should take every precaution in handling the young calves which are to be placed in the herd.

Even though a young calf establishes respiration and gets its first meal without difficulty, it is still subject to many ills, chief of which are digestive disorders of some kind. These troubles are likely to be more numerous among calves that are weaned while young and fed from pails. Indigestion, or scours, as it is generally known, is the most common trouble in raising calves by hand. The chief causes of this trouble are: Overfeeding, feeding cold milk, old or sour milk, and the use of dirty pails, troughs, or stalls. By keeping the conditions right all the time these troubles might be avoided. Each calf should be watched closely for signs of indigestion. Foul smelling dung is often the first sign of the trouble. When such indications are present the ration should be cut down to one-half the usual amount. When a severe case of scours is noticed, the feed should be reduced and the calf should be given two or three ounces of castor oil in one pint of milk. For a few days following this treatment it is well to add one teaspoonful per pint of milk fed of a mixture of one-half ounce of formaline in 15½ ounces of water.

White scours, or calf cholera, is quite common with calves. This is a violent and deadly form of diarrhoea. It may appear immediately after birth and is likely to show itself within the first or second day. The calf is very sick from the beginning; the eyes are sunken, the belly retracted, the breathing is short and rapid, the temperature very low and the calf soon becomes unconscious. The discharge from the bowels is rather profuse, of a white color and very offensive odor. As a rule, the calf dies within twenty-four to thirty-six hours. This is a contagious disease which gains access to the calf's body through the naval soon after birth. An animal once affected rarely recovers. There seems to be no treatment, therefore we must rely upon prevention. The trouble may be avoided by making sure that the calf is dropped in a clean stall and that it is not allowed to come in contact with dirt or manure until the cord is dry. If the herd is on pasture, it is best to allow the cow to remain there until the calf is born. Infection is not likely to occur in the pasture. If the calf is dropped in the barn the surroundings should be free from filth.

Occasionally young calves suffer from constipation, notwithstanding the purgative effects of the colostrum or first milk. This may be due to unthrifty cows or the feeding of dry, innutritious feeds during the latter periods of pregnancy. Whatever the cause, if the calf is costive, showing signs as in colic and failing in appetite, no time should be lost in giving relief. First remove the cause if it can be located. To stimulate the bowels administer one or two ounces of castor oil.—D. G. Sullins, Animal Husbandman, Georgia Experiment Station.

Tobacco Does Not Add Fertility

We find that there is a popular belief among the tobacco growers of Wisconsin that the tobacco plant adds fertility to the soil. They claim as proof—any crop following tobacco will do unusually well. We claim it requires a large amount of fertilizer in some form to grow a good crop of tobacco. The tobacco crop does not use all of the plant food elements in the fertilizer, so they are left in the soil for use of the crop following, this together with the extra hoeing and cultivation required results in a heavy crop of corn, etc. Kindly set us right—give the facts from the best authority.

Brooklyn, Wis. F. L.

It has been determined that a crop of tobacco yielding 1,000 lbs. of leaf to the acre removes from the soil, in the stalks and leaves, about 67 lbs. of nitrogen, 85 lbs. of potash, and 9 lbs. of phosphoric acid. Heavier crops than this will draw upon the soil elements accordingly. Because tobacco is so rich in these elements is seen the reason for growing the crop on fertile soils, and also explains the reason why the growers are using much fertilizer.

The very fact that tobacco is usually grown upon the best soil the farm has, together with the facts that special attention has been given to the addition of fertilizer and that it is a cultivated crop, accounts for the successful crops which are to follow the tobacco crop. The tobacco crop contributes nothing to the soil as do legumes but, on the other hand, it is a crop which is regarded as drawing heavily upon the soil elements. The same observations might be made about the corn crop. The small grain crop following corn in the rotation is usually very good for similar reasons.

Harvesting Annual Sweet Clover

Last spring I received some annual sweet clover from the Iowa Experiment Station and planted it in June. The clover is now about five and one-half feet high and is doing nicely. Should I cut it this fall for seed or wait until next year? Will the clover get ripe in this section of Minnesota? How should I thresh it? If I get some seed, how much to the acre should I sow?

Wadena, Minnesota. R. S. L.

The annual sweet clover should produce seed this fall and, unless there is a considerable quantity, we would suggest that it be harvested direct from the plants as it ripens; that is, by stripping the seed heads by hand. In this way, the full quantity of seed produced is more likely to be secured than if the plant is allowed to stand until the majority of the heads are ready for harvest.

Sweet clover seed does not ripen at the same time and there is considerable wastage both by shattered seed and by immature seed if the plant is harvested as a whole. If the quantity is too large for this kind of handling, it may be harvested when the majority of seed seems to be mature. It can be threshed out by means of a flail or, if the quantity is sufficient, by the use of the usual threshing machine or clover huller.

Annual sweet clover is a relatively new introduction and we have not sufficient information concerning it to speak with authority as to whether it will mature seed in this section of Minnesota. However, from such knowledge of the plant as we have, we would think that it should mature seed, at least we do know that it will do this in southern Wisconsin. We are not advised as to whether this plant will make growth next year but we anticipate that it is not dissimiliar to the biennial sweet clover in this respect. In any event, it would be well to cut the sweet clover, leaving a 6- to 8-inch stubble.

As the annual sweet clover seed is very high in price, it is a questionable practice at the present time to use it as a regular field crop. For a year or two, at least, it should largely be grown for seed and preferably planted in drills and possibly cultivated somewhat so as to keep down weeds and foreign grasses. In any event, we would hestitate to seed at a rate greater than five pounds to the acre.

Thousands Know That No Other Light Car Gives So Much In Real Satisfaction

The Cleveland Six has won its place of favor among thousands of discriminating buyers by its splendid performance in daily service. Those who sell the Cleveland sell it for what it really is, a distinctly better car. Those who buy it, buy it with the understanding and convict on that it is a better car, that it will serve them honestly.

The Cleveland has made its friends by its character. It is of sturdy construction, dignified in line, handsomely finished and alive with power. The exclusive Cleveland motor, quiet, pliant and powerful, the most highly refined of the enclosed overhead valve type, is foremost among light six motors. Its rapid acceleration, its pulling power which takes it flying over the hills and its economy of fuel, mark it as an unusual motor. Drivers who know motors by experience say there is no other like it.

You will be interested in the ease of handling your Cleveland, how lightly it steers, how easily it shifts and at the instantly positive action of its brakes. And for comfort, the long underslung springs smooth out the roughest roads and add pleasure to country driving.

A real ride in the Cleveland will show you, better than we can tell you, what a good car the Cleveland is.

Touring Car (Five Passengers) $1435 — Roadster (Three Passengers) $1435
Sedan (Five Passengers) $2445 — Coupe (Four Passengers) $2345
(Prices F. O. B. Cleveland)

There are Cleveland Six dealers in more than 2000 cities and towns. There is one where you live or nearby. Arrange to see the Cleveland. Catalogue mailed on request.

One Man Saws 40 Cords a Day

At a Cost of 1½c a Cord! Send today for Big Special Offer and Low Direct Price on the OTTAWA, the One-Man Saw, the first made and sold direct from factory to user. Greatest labor saver and money-maker ever invented. Saws any size log at the rate of a foot a minute. Does the work of ten men. As easily moved from log to log or cut to cut as any wheelbarrow. 4-Cycle Frost Proof Engine has balanced crank shaft—pulls over 4 H-P. Magneto equipped; no batteries needed. **Special Clutch** lever controlled enables you to start and stop saw with engine running. Automatic Speed Governor. Easy to move, costs less to operate. When not sawing, engine runs pumps, feed mills and other machinery. Pulley furnished.

OTTAWA LOG SAW

Cuts Down Trees—Saws Logs By Power

Patent Applied For

Cash or Easy Payments Shipped direct from factory.

30 Days Trial No waiting—no delay. Let the OTTAWA saw your logs and pay for itself as you use it. **10-YEAR GUARANTEE.**

See the OTTAWA at work on your farm once and you will never give it up. Thousands in use, every owner a booster. Out-saws any other on the market. Send today for FREE BOOK and Special Offer.

What Next?

An Abstract From An Address Delivered by H. E. VanNorman, President National Dairy Association, Before National Association of Ice Cream Manufacturers

Why is it possible for this group of men, whose work and whose homes are in the city, to be here today? In early history of this nation we are told that 88 per cent of the people lived on the land, produced practically all of their own food and material for clothing, wove their own cloth, and made their own shoes. Today we are told only 33 per cent of our people live on the land producing the raw materials for not only their own food and clothing, but that for the other 66 who don't live on the land.

In other words, your business and your life in the city is only possible because out on the farm somewhere, somebody is producing for you raw materials for your food and clothing. This is only so because the methods of modern agriculture make it possible for the farmer to harvest a bushel of wheat with ten minutes of human labor today compared with over three hours of human labor per bushel required before the Civil War.

Getting more personal—your business as manufacturers of ice cream is only possible because somebody is out on the farm, often arising at four or five o'clock in the morning to milk the cows from which you secure enough dairy products which permit you to label your product "ICE CREAM", in spite of the yellow journals which may accuse you of having small foundation for your title. Again, your business is only possible because we have a great consuming population to provide a market for you.

Some of us are convinced that our national welfare is going to be much influenced in the near future by the amount of constructive thought which the thinking minds of the cities give to the problem of the relation of the cities to the open country.

We are told that the dairymen are selling their cows, are devoting their time to other branches of agriculture, are retiring and moving to town, that their sons are going into other lines of business, that the ownership of the land is going into the hands of a less intelligent, less educated type of immigrant. What is to be the influence of this type of man on our national welfare?

Our cities can prosper only if enough people remain in the country to produce the food, not only for themselves, but for our vast city population.

The National Dairy Show was organized some fourteen years ago, not merely to provide a place where some manufacturer could sell a churn to a creamery man, or a freezer to an ice cream manufacturer. These are but incidents to the more fundamental motive namely, that if we are to sell more churns and more freezers, it will be because there is more cream churned and frozen and that to produce this we must have more and better cows; and after all is said and done, the vastness of the industry can be developed only insofar as there are cows to supply the raw material for the consuming public to eat.

The men who have made the Dairy Show business, both financially and administratively, have looked far beyond the mere question of sale of floor space, or the awarding of cattle premiums.

Some firms who have spent thousands of dollars in expense for every hundred dollars of sales at the show have rightfully said: "If measured by our sales at the show, it would not pay us, but we make our living out of the dairy industry; therefore, it behooves us to support this enterprise which is striving to develop a greater industry, and therefore gives us an opportunity for a greater business."

What has the future in store for everybody whose business is dependent on the cow and her products? Europe is shipping products into this country. Does this mean that we have reached the time when we cannot feed our own people? Does it mean we are charging our own people so much that they must go to cheaper countries for food products? These are things about which somebody must think.

What is to be the part of your organization in the future of this Dai-

ry Show? This National Dairy Association, which conducts the show, is a membership organization to which every one of you men are eligible for membership at the rate of $50 for a life membership. Membership taken only because you believe in the cause for which this institution stands, only because you want to be a booster, only because you believe that in proportion as every branch of the industry contributes its share not only of financial support, but of its constructive thought and enterprise, will the whole prosper.

As president, I take the liberty of urging that you openly and aggressively align yourself as a business dependent on the cow with the other great organizations in the further development of this enterprise. With no wish to intrude on the professional problems of your branch of the industry, I still feel free to say that, after all, a great big whole of which you are only a part, needs your cooperation.

Florida Live Stock Round-up

The fifth annual live stock round-up was held at the University of Florida, Gainesville, on October 7th and 8th, with an attendance of nearly 300 from all parts of the state. The subjects considered were: the best methods of feeding and marketing live stock, and the control of diseases.

The growing and fertilizing of peanuts was handled by Dr. J. E. Turlington and Mr. S. W. Hiatt, and a talk on grasses given by Professor J. B. Thompson. Mr. W. C. Lassetter, of Progressive Farmer, described the best legumes for soil improvement.

Director P. H. Rolfs of the Florida Experiment Station described some of the best work done by the station in recent years, and told how the University is fast losing its best workers on account of being offered better salaries elsewhere. He brought out the fact that the Florida Station has received very little help from the state during the past twenty years, being supported almost entirely by federal funds.

Mr. W. H. Traer, editor of the Florida Farmer and Stockman, described the rapid growth of the live stock industry in the southeast during the last few years, and Mr. C. A. Cobb, editor of the Southern Ruralist, gave most valuable advice on the co-operative marketing of live stock as practiced in Mississippi. Mr. H. M. Bennett of California gave a strong paper on methods of financing the cattle business through loan associations. Before the close of the Round-up, the meeting adopted resolutions urging liberal action by the next legislature for support of the University, and pledged its members to work with their home representatives on this subject.

The night session included some moving picture films, showing the latest methods of eradicating cattle ticks in the South, and progress of the movement for better sires and better stock under auspices of the Federal Bureau of Animal Industry.

The second day the entire meeting discussed for several hours the improvement of pork production. One of the best papers was given by Professor J. F. Duggar, director Alabama Experiment Station, giving details of several years' work on pork products in Alabama. He showed where cowpea pasture alone produced 125 lbs. of pork per acre, and a similar lot was fed on pasture corn, making a gain of 336 lbs. of pork per acre. An acre of rape produced 452 lbs. of pork, chufas 374 lbs., and peanuts 335 lbs. per acre. One of the tests showed that a pound of pork can be produced with 1.84 lbs. of dried peanuts in the hulls.

Some recent work of the Florida Experiment Station has attracted great attention throughout the South, in which hogs were fed upon different feeds. This work alone showed conclusively that feeding peanuts for 44 days produced soft fat, and that the feeding of corn, shorts, peanut meal, and skimmilk again hardened the fat. Some variations occurred due to the individuality of the animals. All the results thus far obtained showed that there are several factors that produce soft pork, not only feeds, but the breeding, handling, and care of the animals.

Dr. E. N. Nighbert, in charge of tick eradication for the state and government, admitted that Florida is making only moderate progress in tick eradication, but urged more education and co-operation to improve the live stock industry by getting rid of ticks.

E. N. Wentworth of Chicago described how Florida might produce a larger proportion of her own meat supply instead of importing nearly three-fourths. Professor C. H. Willoughby gave a talk on the use of mixed feeds, and advised against using patent medicine remedies or cure-alls.

Florida. C. H. WILLOUGHBY.

Shipped complete for immediate installation

The beauty of the IDEAL-Arcola method is that no cellar is needed. Everything is on one floor. The Arcola is placed in any room that has a chimney connection. No running to cellar. Same water is used over and over again for years. No fire risk.

Buy now at present attractive prices for outfits complete!

IDEAL-Arcola outfits consist of the boiler and radiators to heat various size houses. Write us your requirements! Unlike stoves, there are no coal-gas leaks into the living-rooms. The IDEAL-Arcola delivers the soft, radiant warmth of hot water—not the dry, burnt-out atmosphere of stove heating. There is no fire risk to building—no danger to children—fire lasts for hours! The Arcola burns hard or soft coal.

The outfit consists of an IDEAL-Arcola Radiator-Boiler and 4, 5, or 6 AMERICAN Radiators and Special Expansion Tank—everything except labor, pipe and fittings, which any local dealer will supply. See table above for various sizes and prices of outfits.

Catalog showing open views of houses, with the IDEAL-Arcola Boiler in position will be mailed (free). Write today

He can forget his roof—while others are patching, painting and re-roofing.

IF YOU apply a roof once and then forget it, you are better off than the man who is constantly watching his roof for failures. Labor is too high and help too scarce to make constant roofing repair anything but an expensive nuisance. That's why business men all over the country have adopted Asbestos Roofing — because it is the most economical.

A sound roof of Asbestos lends an integrity to farm buildings—takes them off your mind. A tight roof is a building saver and a standard insurance to stored crops, feed and stock. And here the fire-repellent property of Asbestos Roofing is important —safeguarding your season's wealth.

Why Asbestos Roofing is Permanent

People can't believe until it is explained to them why Asbestos Roofing never needs painting or coating. Most roofings, because they have a base of animal or vegetable fibre felt, need constant coating to keep them weather-tight.

Asbestos Roofings are made on an entirely different plan. The fibres of Asbestos rock are felted together, and waterproofed with natural asphalt,* presenting what is virtually a surface of solid stone to the weather—stone which is almost as impervious to fire, water, snow, wind, sun and rain as the boulders in your field. That is why asbestos is the only "once and for all" roofing.

Asbestos Roofing and Johns-Manville

It's been twenty-five years now, since Johns-Manville first made Asbestos Roofing. There are scores of buildings that have had the same Johns-Manville Asbestos Roof for two decades.

As experts in roofing manufacture, Johns-Manville can help you in your decision not only as to what to buy, but how to apply it. And even after a Johns-Manville Roof is sold and laid, its registration with the company obligates Johns-Manville to see that you obtain the service promised.

** Asbestos Shingles are made of these same asbestos rock fibres, but instead of asphalt, Portland cement is used as a binder. Consequently, a roof made of Asbestos Shingles improves with age, because the shingles take on a harder set the longer they are in place.*

FALL REFLECTIONS OF A FARM

(Continued from first page.)

be mighty thankful to sell three perfectly good heads for one quarter of a dollar to whoever would bite and buy. If three cabbages were too many for one family at this little price, our sign signified that we would part with just one for ten cents, though it was hard. (The parting, as well as the cabbage.) Well, my owner has sold a pile of them this way, as much as several tons would come to at those preposterous figures previously quoted, and they are still merrily selling at this writing—so the cows can't have them all.

But take potatoes. I did my best with this staple crop and I told my owner early in the spring that if he would put in double acreage, I thought it would be the smart and proper thing to do. So he took my advice as usual and as I had hinted that a power sprayer and a digger and plenty of fertilizer and so on would not come amiss, he went the whole hog and everything would have turned out lovely for me and I would have easily retained my reputation for sagacity and brains had not every other farm proceeded to figure likewise—with the rather painful result that I find myself slightly discredited as a prophet in my owner's eyes, while the potatoes aren't bringing enough to pay for the before-mentioned up-to-date articles.

But it's a long road that has no turning, at our place, and I tell my owner things might be dirt-sight worse, as for instance, if he had bought a cozy car on which had only been paid the initial installment and which had no appetite for cabbage and spuds in places of expensive gas and oil when a fellow is in a tight fix. He allowed that this might be so, but he ventured the prediction that many a good farmer has been lotting on his fall harvests to pay off the final mortgage on others like me and to buy much-needed labor-saving tools and to fix up his barns and the house and perfectly legitimate expenditures like that. And it's the truth. It's no laughing matter and levity from one of those hardest hit is out of place, my owner says. But it's like this. Last year the farmer, if he amounted to a hill of beans, made good at his dirt trade, and I have been in this game long enough to discover that agriculture is a lottery if ever an industry was. My owner and I made good last year. We bet that we could turn the same trick this year—and so many of us bet the same way that we all lost. Now next year you'll see a lot of farmers and their farms so sick of the game that they will refuse to bet at all, that is, to amount to anything, and then will be the time for the year-in and year-out gamblers to keep right on betting just as they always do. At least that's the way it figures out to me, and unless my owner and his family are so weak next spring from their cabbage and potato and milk diet that they can't get out to wake me up and turn me over, I bet you'll see me with my fields as green and as flourishing as ever—and green with cabbages and potatoes and meadows and pastures too!

But say! I have to chuckle quietly to myself when I think back as to how there wasn't going to be half enough food to go around this winter, if everybody else who wasn't a farmer was to be believed. And although I wouldn't hint it to the wrong person for the world, yet the joke appears to be on we farms and our owners who fell for this famine-cry and who thought that if all the neighbors had gone to the city to work, as was scare-headed all over the country, surely now was the time to go on in while the land was fine—and make a decent little fortune selling quite necessary food to the other farm-shy city natives.

But I figure that it wouldn't be safe for any half-baked newspaper reporter or average layman anywhere to come around to an average farm about now with the cheerful tidings that America is doomed because the agricultural population is dwindling away and that our very late census proves it. I don't know just what would happen to such a well-meaning prognosticator but I should worry for his personal safety if cornered in any ordinary farmer's field or back yard. Such a person might find that he had got in decidedly wrong, his host being in strangely peeved mood at such intelligence. And the reason therefore the owner of my broad acres, for instance, might proceed to make plain to his caller. If every other farm is abandoned (as reports state) and if every other farmer and his tickled family have gone to the city (as stated) why in Sam Hill do we find everybody trying to eat up the biggest and best crops in the country's history and, who, for the land's sake, is raising 'em? And if the misguided caller still insists that all this must be so, nevertheless, because statistics and figures say so, then it may be that my sore-tried and impatient owner will take his guest across his knee and administer good old fashioned chastisement of a style familiar to a less cock-sure generation.

The painful truth is that not every other horny-handed son of toil has emigrated cityward, nor that every other farm has been permitted to grow up to dandelions and witch grass. We may have rather recently kidded ourselves along these lines, even so-called wise calculators like me —but my owner and every other farm owner now knows that this was the biggest blither that ever was believed by a conservative set of country folk who are not in the habit of swallowing everything they hear and read for gospel truth.

This fall finds us with plenty of farms on the job and also plenty of farmers and their help, and if there be any city chap and his lady anywhere who is feeling the call to go back to the land and save the nation from famine and starvation, I'd strongly advise him to remain where he is because that back-to-the-land business is old, old stuff.

The almanac man has already come out with his bit for 1921. He predicts that the coming year is going to be a holy terror so far as crops go and that it is extremely likely that there won't be any at all. He lays these pleasant intuitions to the messy weather due for next season, but if he should ask me, from my experiences down the years as a canny old farm, I would venture to remark that too cheap produce made at a grand loss this season would be far more apt to cause the situation.

Be that as it may, my owner and I are resolved to go down with the ship, meanwhile taking all farm propaganda with a grain of salt, but ready to let out a link, as we did this year, whenever the time seems ripe. We aren't exactly elated over our big losses this fall, but we refuse to be too downhearted, and I expect that my owner is going to do business at the same old stand another season—which means that it's mostly up to me.

But I do hope that there won't any more of the boys leave farms in the lurch hereafter, for if they do, we might as well all quit today, for the crops will be sure to reach such stag-

gering piles and proportions that they will last the poor city people for ten years and a day and we'll have to pay them boot to get rid of the lot.

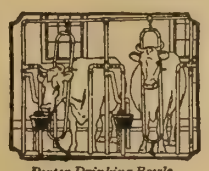
As I said in the begininng, it's an ill wind that usually blows nobody good, and between you and I and the big oak tree, my owner and I are hoping that this winter won't be too inclined to treat us rough, and maybe crops will then return to normal. There's such a thing, you know, as Nature giving the farms and farmers so much good-weather rope that they just all go and hang themselves. And who wants to go broke feeding Paddy Railroadman for nothing every fall?

Hardy Alfalfa in Oregon

(Continued from page 692)

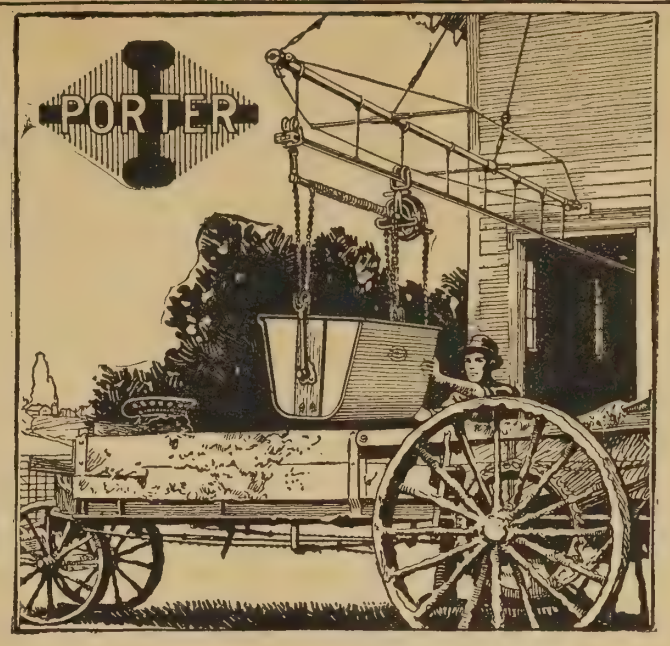
stance, in Deschutes County in central Oregon, the increased yield has been so apparent that the First National Bank of Bend financed on easy terms for its patrons a 30,000-lb. pool of Grimm seed. This was distributed in co-operation with the Deschutes County Farm Bureau.

We have considerable winter-killing in this high altitude," said Mr. Ward, the agriculturist for the bank, "and we find that the superior resistance of Grimm alfalfa to cold will insure us much more vigorous stands. We need alfalfa in this country and a ton per acre additional yield from Grimm alfalfa will be a big factor in the dairy business we are trying to develop. Deschutes County has recently made an importation of Jerseys from the Willamette Valley, has recently organized a County Holstein Breeders' Association, and we are anxious to secure some foundation Guernseys. Our farmers who are located on small irrigated ranches have, to too great an extent, been selling their hay in the past few years. They are, at this time, however, beginning to realize that that is an unprofitable practice and are finding that a few good cows on every ranch are making the farmers more prosperous."



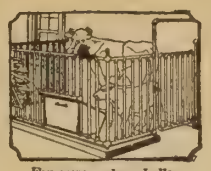
Wallowa, Klamath, Morrow, and Wasco counties are this year, through the farm bureaus, studying the adaptability of the hardy type alfalfa to their conditions.

According to agricultural history Grimm alfalfa was introduced into the United States by Wendelin Grimm, a German, who came to Carver County, Minnesota, in 1857, bringing with him from the old country fifteen or twenty pounds of alfalfa seed. It is distinguished from common alfalfa by the root system. Instead of the typical alfalfa tap root, it has a root system more nearly like the clovers, consisting of scattering underground shoots.

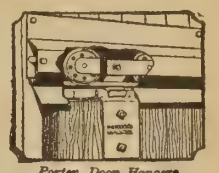


The seed can not be told with certainty from other alfalfa seed nor can the plants, although some experts maintain that Grimm produces somewhat finer and more leafy hay. It is a heavy stooling type. The flowers are the same color as those of common alfalfa but there are often many greenish blossoms varying to dark olive, some of them smoky in hue. The hardiness of this variety is attributed to long continued selection under adverse climatic conditions. In warmer districts it is not proving so productive as the common strains. Most of the seed is produced in Minnesota, Montana, Idaho, and the Dakotas. Grimm alfalfa is quoted on the markets at a higher price than common types but this is rapidly being determined a negligible factor in Northwest alfalfa growing districts at an altitude of 2,000 feet or more.

Most of the things put off until tomorrow should have been done yesterday. A careful planning of work this winter will enable you next spring to do today's job today.



Clean, comfortable, convenient—Porter Steel Stalls and Stanchions



Porter Drinking Bowls provide a constant supply of fresh, clean water

For quick, dependable work in hay harvest—Porter Hay Tools

Porter Litter Carrier and Swinging Boom

For cows, calves, bulls and hogs—light, airy, Porter Steel Pens

Porter Door Hangers are storm-proof, bird-proof and sag-proof

The tiniest tot can open and close the "STRAIGHT-AWAY" Garage Door

Easiest The Meanest Job on the Farm

¶ When farm labor was cheap and plentiful, the number of hours a day spent in barn cleaning, or the number of men required, made little difference. But no man ever enjoyed it—slopping around a filthy barnyard in rubber boots, or pushing a dripping load of wet manure to the top of the pile.

¶ It costs you twice as much now to hire competent help, if you can get it at all. Barn cleaning and hand feeding can easily eat up the net profit from your barn operations.

PORTER

"Dependable Since Sixty-Eight"

overhead Litter Carriers and Feed Carriers cost you less now than ever before, in terms of products you have to sell, and pay for themselves quicker. They transform two disagreeable jobs into quick, easy, profitable tasks, keeping the men or the boys contented, and giving them new interest in their work.

¶ And even more important, if possible, is your pride in the ownership of good tools; in the better appearance and more sanitary condition of your barn; in safeguarding those who must depend upon your carefulness for the purity of their dairy products.

¶ There's a dealer near you who SELLS Porter equipment, because he BELIEVES IN IT and can personally recommend it. Ask us for his name—and for the complete Porter Catalog.

Milk Situation in New York

News Items from E. R. EASTMAN, Editor Dairymen's League News

THE Board of Directors of the Dairymen's League voted to recommend to the members that the price for November milk and the conditions under which it is sold shall be the same as those during October. This is $3.65 per hundred pounds for three per cent milk at the 200-210 mile zone. This price is under the cost of production and is contrary to the custom of the price advancing from month to month at this time of the year because of increasing costs. The decision to go along on this price was reached by the directors, however, because of market conditions and the general tendency downward in all markets.

The November Price

At an earlier conference held with the dealers the League, officials were given to understand that the continuation of the October price for November would be accepted by them, although this sentiment was not expressed in actual words. While the directors were still in session, the dealers asked for a conference with the League and announced that if the October price were insisted upon for November, they would be obliged to close many of their fluid plants. The Bordens' Farm Products Company, one of the two largest distributors, handed the League a list of thirty-two fluid plants which they would close November first.

⚜

The directors of the League believed that this was another effort of the dealers in line with what had already been done by means of propaganda and otherwise to force the farmers' organization into a hole at a time when market conditions were bad, so they unanimously and emphatically reaffirmed the recommendation that the price for November be the same as for October, and that the dealers should keep all of their plants open the same as they had in October.

Sheffield Accepts

It, therefore, looked for a few days as if there would be a general fight. However, the Sheffield Company, the other largest distributor, has just accepted the price for November and will keep all of their plants open. This probably means that there will be no trouble with the fluid distributors.

⚜

There were on hand in the League office on October twenty-fifth 20,746 signed co-operative contracts. This included 4,000 received by the League before the present campaign began. There are from ten to twenty thousand more signed contracts in the hands of the 1,100 field secretaries who have not had time nor opportunity to send them all in as yet. The League directors have voted that pooling would be started when at least 50,000 members had signed the co-operative contracts and orders for pooling.

Progress in Pooling

Another series of meetings is being held all through League territory. Farmers are making further study of the co-operative contract, and this better understanding of the principles involved and also the better realization of what the dealers are trying to do to the League are bringing about a renewed enthusiasm in the co-operative campaign. This will result very shortly in there being enough signatures obtained to start the pooling operation.

A factor that has done much to show the dairymen the need of immediately getting back of the co-operative campaign is the large amount of propaganda which the dealers have spread throughout League territory to injure the organization and to defeat the purposes of the co-operative campaign. This propaganda has had exactly the opposite effect from that intended by the dealers, although it is probable that some of that sent to the business men, whose co-operation the dairymen need, has had some effect.

The gravest trouble which the dairymen are facing at the present time is the great financial loss of the thousands of members who have now no good market for their milk, since the manufacturers ceased to accept it. These dairymen have been keeping their milk at home, or separating it and shipping cream, or selling it to butter and cheese factories. In every case, this has meant heavy loss, and there are thousands of them who cannot very much longer continue to do business in this way. They will either have to sell their cattle, as some of them have already done, or make arrangements to get their milk upon the fluid market. The fact that many of the fluid dealers want to close at least a part of their plants shows that this movement of the milk, which was formerly manufactured, toward the fluid market has already begun.

New York Pooling Contest

The New York Dairymen's League is seeking an efficient organization whereby the producers in that territory may protect themselves against exploitation and advance their interests. To accomplish this they are asking all League members to sign a contract for the sale of all their milk through their own organization and agreeing to pool the proceeds that each person may receive the same price for the same quality of milk regardless of the market to which sold.

The contract is severe and has teeth in it to protect the majority of the signers against the weak-kneed minority that through fear or cupidity might desert in times of stress and so wreck the organization. The League announcement is that until 50,000 of the 85,000 members sign, this contract is not to be put into operation. While the requirements are drastic, it does not differ in essentials from that of the California co-operatives that have recently been discussed in Hoard's Dairyman, and other organization in different sections of the United States; the proposed Wisconsin Cheese Federation adopting a somewhat similar contract. We have faith that milk producers have the brains and ability to build an efficient organization to hire competent managers to make this plan a success. If not, then this plan or any other plan will fail. We should not be half-hearted or go half way if we hope to build a strong co-operative institution. The only way to co-operate is to co-operate, and to co-operate with and not against.

The New York League contract reads as follows:

This agreement, made this.....day of .....192....., between Dairymen's League Co-operative Association, Inc., hereinafter known as the Association, a membership corporation incorporated by and under the laws of the State of New York, and having its principal office and place of business at New York, N. Y., party of the first part, and ....., hereinafter known as the Producer, party of the second part, for the purpose of acting as agent in performing for him services connected with the production, manufacture, preservation, drying, canning, storing, handling, utilizing, marketing, and selling all of the milk and dairy products produced by him, Witnesseth:

That in consideration of the outlays and expenses incurred and to be incurred by the Association in providing means for handling, manufacturing, and marketing the milk and dairy products of the producer as mentioned herein, the said parties have agreed to, and do hereby agree as follows:

1. The Producer, wishing to avail himself of the facilities to be furnished for marketing his milk and dairy products when the association is equipped for same, hereby appoints the association his sales agent and as such grants to it full power and authority to sell said milk in the fluid state, or in its discretion to manufacture the same into such products as it may from time to time determine, and to sell such manufactured products, the proceeds of all such sales to be blended into one fund and distributed as hereinafter provided.

2. The Producer covenants and agrees to and with the association that if he at any time refuses or neglects to deliver such milk or the manufactured product thereof produced or manufactured by him to the association, or upon its order, at such time and place as the association may direct, then and in that event in every such case the Producer neglecting or refusing so to do will pay to the association for such refusal or default, the sum of ten dollars ($10.00) per cow for.....cows, and if such default or refusal shall continue for more than one month, an additional sum of Three Dollars ($3.00) for each cow per month, for the same number of cows, so long as such default or refusal continues, none of which payments are to be construed to be a penalty or forfeiture, but as stipulated liquidated damages as prescribed by Section 209-A of Chapter 655 of the Laws of 1918 of the state of New York, and it is hereby agreed that the Association will suffer by reason of such refusal or default.

3. Such milk shall be delivered by the producer to such shipping stations or other plants as the association may from time to time direct, and to be of such test and quality, delivered at such hours and produced under such sanitary and hygienic regulations as may be required by the rules and regulations of the Association, and the Board of Health, the City, and the Laws of the State where the milk is produced and is to be finally marketed. If the Producer under the direction of the Association manufactures such milk, the products thereof to be cleanly and wholesome and in good marketable condition.

4. The Producer will endeavor to follow the instructions of the Association as to the proportionate quantities of milk produced during the several months of the year, in order that an adequate supply for consumers at all seasons of the year may be assured.

5. It is further agreed that in case the association fails to sell the milk of the Producer as herein stated, that the Producer will in each and every case manufacture such milk into such products as he may desire and deliver said manufactured product to the association upon its order for sale, or if directed by the Association, will deliver such milk at such station or manufacturing plant as said Association may direct.

6. It is mutually agreed between the parties hereto that the Producer shall have the right to give away or retain for his own use such of his milk or other dairy products as he may wish, but the producer shall not sell any products contracted to the Association, to any outside party, except such products only as are offered to the Association as herein provided, and rejected by it, or upon written consent of said Association.

7. It is further mutually agreed that if the Producer is offered a price for his milk or dairy products in excess of the price then obtained by the Association, said Producer will turn over such offer to the Association.

8. For direct loans made by the Producer to the Association to provide initial capital, the Producer shall receive a certificate of indebtedness, one-fifth of which with interest shall be retired each year from the special fund herein mentioned to be created.

9. The proceeds of all sales made by the Association for the Producer shall be paid for by the purchaser or purchasers thereof to the Association, which proceeds, together with the proceeds of sales made by the Association for other producers, shall be blended into one general fund, the Association to make distribution thereof after making the deductions hereinafter stated, and pay over such funds to the Producer and to other producers in the same proportion that the quantities delivered by the several producers to the Association for sale shall bear to the whole, so that the price received by the Producer shall be uniform with that paid other producers, regardless of any variation or differences in the price received by the Association from such sale for the several producers, subject to such equitable differentials as said Association may from time to time establish. The Association shall deduct from the proceeds of such sales such uniform percentages as they charge others for like services and which the said Association may deem necessary to meet the expenses already incurred, together with such other sums as may be necessary to cover interest, overhead, depreciation, guarantees and all such other expenses as may be reasonably estimated as essential to be incurred, by the Association in conducting its operations, for which no certificates are to be issued.

10. The said Association shall also make further deductions to create a special fund to retire loans; to be used in building warehouses or other necessary buildings; to purchase land and buildings; to secure necessary equipment; to provide such working capital as said Association may deem necessary; such deductions for the special fund to continue as long as the Producer delivers milk or milk products to the Association for sale. After the close of each fiscal year, each producer shall receive a certificate in such form and payable at such time or times and at such rate of interest as such Association may from time to time determine for all moneys which he has contributed that year to the special fund from the percentages levied on his milk and dairy products, as herein provided.

11. The Producer agrees that said Association may also receive the proceeds of sales to other producers, and that said deductions as herein specified shall be uniform as to each producer, so that each producer will receive the same price per unit subject to such equitable differentials as may from time to time be established by the Association; distribution to be made by the Association which is hereby appointed by the producer sold arbitrator of the distribution of said sums, and such distributions when so made shall be final and conclusive and binding upon the parties hereto. The Producer, in the absence of fraud, hereby waives all his rights in law or in equity to an accounting therefor, and this contract shall act as a bar thereto in any proceeding taken by the Producer therefor:

12. All of the aforesaid distributions as herein provided are to be distributed to the Producer on or before the 25th day of each and every month for approximately the amount realized from the milk and dairy products sold and paid for during the previous month, after the aforesaid deductions have been made; and as soon as the fiscal year as all of said milk and dairy products handled as aforesaid have been sold and pay received therefor, full settlement is to be made to the producers thereof.

13. The Producer hereby authorizes the Association from time to time and at all times when in its judgment such action will promote its efficiency, to borrow money in its name and to secure payment thereof to pledge part or all of any unsold milk and dairy products, accounts receivable, notes receivable and trade acceptances in which the Producer has any interest as owner or otherwise, the pledge to be first paid from the proceeds thereof.

14. It is further mutually agreed that the Association may deduct from the proceeds of sales as herein provided, a further sum of One Dollar ($1.00) for each year, which shall be a subscription to the Dairymen's League News.

15. It is further mutually agreed that this contract shall run continuously unless cancelled by further notice of either party to the other between the 12th and the 28th day of February, both inclusive, of any year, which notice shall be in writing and become effective on the 1st day of April then next ensuing, subject to any right or lien which the Association has against the Producer or his property until his indebtedness to the Association is fully paid, and subject to the rules and regulations prescribed by the by-laws of the Association.

Butter Markets Greatly Upset

Top Grades Show Marked Weakness —Undergrades a Heavy Drag— Weather Conditions a Factor

[Report by U. S. Bureau of Markets]

Weakness that amounted almost to demoralization was typical of butter markets during the week ending October 23 so far as top grades were concerned. The prophecy made last week that prices were near bottom for the present was at least fairly well borne out. However, this fails to more than touch on the true conditions that existed. Fancy butter has been scarce all year and demand for it has often operated to support the market, but recently, while there has been no surplus of fine butter, its steadiness has failed absolutely to hold up undergrades.

Sales of storage butter for future delivery at rapidly declining prices on the Chicago Clearing House Call did little to inspire confidence. It appears at the moment that these sales were probably only anticipating a future condition of the market and perhaps saving it from decided disaster later. The fact remains that shippers and owners took many losses and the few sales that were made with great difficulty were at a great range of prices. The spread between 86 score and 92 score is now wider than ever. At the close of trading Saturday the shortage of fine butter was holding the markets about steady and a better feeling was noticeable in some quarters, especially at Chicago.

There was a fair decrease in storage holdings during the week, but the movement is either much later or much lighter than last year. A few fair sized lots of fancy storage creamery were sold at Chicago at 52c to 54c. No more could be obtained, and losses were registered by these sales. In the eastern markets trade that had been using storage again turned to fresh butter on account of the prevailing low prices.

The average wholesale prices on 92-score butter at five of the principal markets, for the week ending October 23, were as follows: New York, 59.1 cents; Chicago, 54.6 cents; Philadelphia, 57.9 cents; Boston, 57 cents; and San Francisco, 56.3 cents. For the corresponding week last year the average prices were 69.8c, 65.4c, 70.2c, 66c, and 62c, respectively. The receipts of butter at these markets were 7,681,167 lbs. as compared with 8,026,285 lbs. for the corresponding week last year and 7,619,753 lbs. for last week. Storage holdings are 64,688,993 lbs. which is a million less than a week ago and seven million less than a year ago.

Cheese Trading Declines

Tone of Market Weak and Unsettled —Price Drops not Uniform, Some Styles Breaking More than Others

[Report by U. S. Bureau of Markets]

A weak and unsettled feeling continued to dominate cheese markets during the week ending October 23. The opinion of many dealers, as expressed last week, that prices were due for further reductions proved to be correct, for the week's trading opened with declines averaging fully 3 cents on the Plymouth (Wis.) Cheese Exchange. The drop was not uniform on all styles, however, as Twins were but 1½ cents lower, while sales of Double Daisies were reported 4¼ cents below the previous week's prices.

Following this break dealers at Wisconsin primary markets in many cases stiffened their asking prices somewhat more than is customary, but without success, and by the middle of the week some of the larger distributors were selling at close to cost. Only those who were not overstocked held firm to their original prices, regardless of a current feeling that further declines would be necessary before a healthy demand was established. Trading in general at country markets was barely sufficient to maintain prevailing prices.

Condensery Cheese Reaches Markets

Prices at distributing markets did not show such radical declines as at country points, but the tone was unsettled and trading lacked life during the entire week. The break at primary markets had a depressing influence and other factors also contributed to weakness. Continued talk regarding lower prices and rumors as to a heavier production on account of the closing of so many condenseries had some sentimental effect. Considerable uncertainty still attends the latter, for the manufacture of butter at present prices is likewise profitable and there is no assurance that the surplus from all plants will go into cheese. The first condensery cheese in any quantity appeared on the markets during the week and strengthened the feeling that it might be a factor to reckon with, although so far the quality has been nothing to boast of. It is expected that there will be heavy arrivals of this cheese about the first of next month, as considerable quantities are being made, especially in New York State.

Export business is still quiet. The few inquiries received are for cheese at around 20 cents, but this price is too low to attract any real selling interest. Export figures for September, which are just available, indicate that the total quantity exported was approximately 744,000 lbs. In September, 1919, the exports of cheese amounted to 1,689,000 lbs.

The average wholesale prices on American cheese, style Twins, for the week ending October 23, were as follows: New York, 27.5 cents; Chicago, 23.7 cents; Boston, 27.6 cents; San Francisco 24.7 cents; and Wisconsin primary market, 24 cents. For the corresponding week last year the average prices at these markets were: 30.9c, 30.1c, 32c, 29.3c, and 29.8c, respectively. The total receipts of American cheese at these markets were 3,025,667 lbs., as compared with 4,024,891 lbs. for the corresponding week last year and 2,979,752 lbs. for last week. Storage holdings are 18 million pounds, which is slightly less than last week and only two-thirds of what it was last year at this time.

New York Butter Market

NEW YORK CITY, OCTOBER 27:—One year ago today extras were quoted at 70c, while the quotation on seconds was 55@58c. There was an active export demand and practically all arrivals were absorbed as soon as delivered at stores. Today extras are quoted at 59c, seconds fr... 17 to 20c lower; there is no export demand and great quantities of butter have accumulated in practically all stores. The situation is anything but encouraging to the manufacturer and distributor of butter. Trading for the last several days has been decidedly sluggish and, as in the weeks just passed, has been confined to butter of extremely high quality. Buyers are extremely critical of even fancy grades and refuse to purchase unless they find exactly what they want. To add to the unsatisfactory condition, chain stores and other large retailers of butter are drawing on their storage stocks as they feel that values may be lower later and they wish to dispose of their high priced storage stocks in order to avoid heavy losses. The general condition can be safely at-

"Did the first frost catch you with some corn still out?"

The Western Electric Power and Light Outfit is a strong arm on any farm.

"Harvest is a time of worry and hard work to us farmers — and we don't always get the crops in either. Time is short and help can't be had. Anyway, that was my fix up till this year, when I put in a Western Electric Power and Light Outfit. Of course this outfit doesn't do any field work. But the work it does do saved so much of my time that I was able to get all my corn in before the first frost."

B. B. Griesemer

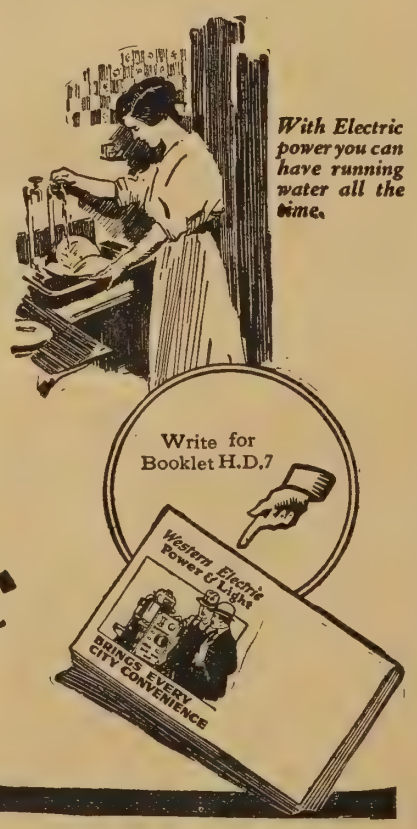
Editor's Note: *Mr. Griesemer is a farmer near Griesemerville, Berks County, Pa.*

"MAYBE you have done better in getting farmhands to work for you than I could. In recent years I've been a sort of a farmhand and chore boy rolled into one. I was so busy milking cows, grinding feed and pumping water that I couldn't get through all my work in the field.

"Not long ago I began to notice the good work done by an electric farm plant belonging to one of my neighbors. It gave all the light needed, but what I liked even better was that it was a powerful plant, built with the idea of doing a man's work.

An outfit that saves time and labor

"The name of this powerful plant was Western Electric, and because I believed it would give me the help I needed, I installed a Western Electric on my farm. The story of what it did may interest you, if you need help too and if you believe an electric outfit should supply power even more than light.



The portable motor makes churning easy

"Western Electric power milks the cows for me. There's half an hour a day saved right there. It also pumps water to my house and barn. Then I have a line shafting belted to the pulley on the engine, and belted to this shafting is a feed-mixer, fanning-mill and grindstone. I tell you, that engine can handle a lot of work. The powerful battery gives all the light needed, and it runs my wife's washing machine and pumps the water.

"So you see, Western Electric power is saving me a lot of time. When harvest came around, I was able to work about three hours more in the field every day. That is why I got all my corn safely in."

The battery lasts longer!

The reason the Western Electric battery lasts so long is that it is charged without stress or strain. As it fills, the rate of flow becomes less very gradually till the current stops by itself. This "tapering charge" means long life to the battery.

With Electric power you can have running water all the time.

How to save time and labor

Booklet H. D. 7 gives some facts and figures on how the Western Electric Power and Light Outfit helps solve the farm labor problem. For your copy write to the Western Electric Company at Chicago, or 195 Broadway, New York.

Some good territory still available for live-wire representatives.

One Thousand Holsteins to France

Arrangements have been completed for the shipment of 1,000 American Holsteins to the devastated regions of France within the next four or five months. Dudley E. Waters, president of the Michigan Holstein Breeders' Association, recently returned from Europe and brought with him the story of the need of the French farmers for better stock.

At the National Dairy Show a joint meeting of the state associations and the officers of the National Association resulted in voting to get behind the movement.

France has suffered, as we all know, great losses of dairy cattle through the war. However, it is not a need of cows that is greatest among the dairymen today. It is the lack of pure-bred sires which is handicapping the future of the dairy industry in the liberated regions.

There are 112,000 females of various breeds in these sections, made up of English Shorthorn cows, the brindle and white Norman cow, the Dutch cattle, the German cattle and American grades. The last three are Holsteins, pure-breds and grades.

Good bulls are a scarcity, the scrub sires not only lacking in records of any kind, but particularly in individuality.

The State Holstein Associations of Michigan, Ohio, New York, Iowa, Illinois, Wisconsin, and Minnesota in this meeting at the National Dairy Show appointed the committee for the restoration of the dairy industry in the liberated regions of France, with Dudley E. Waters as chairman, R. C. Pollock, and Howard C. Barker representing the national and state associations.

The bulls to be donated will be six to eighteen months old, good individuals, and free from disease. Registration papers will accompany each animal. The French government through the ministry of the liberated region will take over the animals at the point of embarkation. They will see to it that the animals are placed in the hands of the best farmers in the various departments in need of pure-bred sires, and make these men responsible to the government for the care of each bull. More than one farmer will have the opportunity to breed his cows to these sires, but only one man will be responsible for the care of the sire.

Holstein breeders who wish to contribute to this cause should get in touch with the state association, or with Chairman Waters of Grand Rapids, Michigan.

Every breeder donating an animal will receive a personal acknowledgement from the French government, and in addition will have the satisfaction of knowing that a pure-bred bull from his farm is helping to increase the production of dairy products in a section which will require several decades to get back to normal in an agricultural way.—Extension Department Holstein-Friesian Association of America.

Jersey Cattle Notes

Week ending October 15:

Number of animals registered: Bulls, 179; cows, 463; total, 642. Number of transfers recorded: Bulls, 175; cows, 462; total, 637.

A few minutes given at a definite time each day will keep a record of the farm business; and with accurate figures at the end of the season a man can see at a glance where he is making money and where he is losing it.

Three big facts

More Milk
Better Milk
Healthier Cows

You'll get more milk, better milk and healthier cows if you feed regularly

Pillsbury's Dairy Ration

(the feed without a filler)

It is made exclusively from all high grade material, without a "filler". Contains no molasses or disguised roughage.

It contains sufficient mineral matter to maintain the health of the cow and is extremely palatable—cows go right after it.

Contains right *quality* as well as *quantity* of protein, perfectly balanced with fats and carbohydrates.

Absolutely uniform—contains eight ingredients, yet is mixed so scientifically and accurately that analyses from different samples tally exactly.

These results have been proved by actual feeding tests on practical dairy farms.

A high-grade ration for all dairy cows, yet costs no more than ordinary feeds.

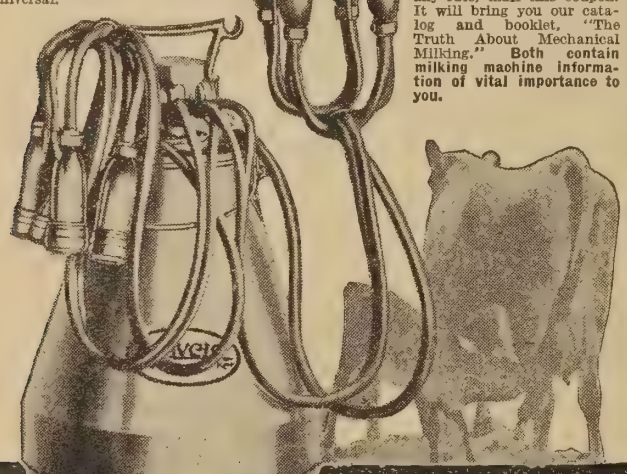
HERE are three letters from farmers who milk their herds with the Universal Natural Milker—real profit-messages of vital interest to every farmer who milks six cows or more.

Universal natural milker

Read these letters. After that we believe that you will want to learn more about this Natural Milker. More than likely one of your neighbors milks his herd with this calf-action machine. Drop over to his place and put it squarely up to him, "Just what do you think of the Universal?"

We know what he will tell you. For our experience has shown that every one of the thousands of Universal users says just about the same thing:

The Universal is the *one* milker with the true, calf-like action.



It is the *one* milker that can be depended upon to do a clean, 100% job of milking every day in the year—that does all that we claim for it and more—always.

The Universal Milking Machine Co.
Dept. 888, Goodale St. and Michigan Avenue, Columbus, Ohio

Its Perfect Teat Cup, its Alternating Action, the wonderful simplicity of the whole machine — these are the features that establish the absolute superiority of the Universal.

Write for the names of Universal users in your section — and the name of our nearest dealer. At any rate, mail this coupon. It will bring you our catalog and booklet, "The Truth About Mechanical Milking." Both contain milking machine information of vital importance to you.

Absolute Satisfaction

"We have used your milker for the past year and are more than satisfied with the results.

"We have been 30 years breeding the class of Jerseys we now have. Naturally they are the pride of our hearts and anything which would harm them in the least we would not use. But they take very kindly to your milker. It is efficient and milks quickly.

"We now milk 9 cows on official test using two single units — strip and weigh the milk in from 30 to 35 minutes.

"We recommend the Universal to anyone looking for a machine of merit."

(Signed) W. B. and W. R. COWLES,
Baraboo, Wisconsin.

Better than Hand Milking

"My Universal has been in daily service since Jan. 1st and it is yet to give us its first minutes' trouble.

"Our herd consists of 80 head of pure-bred Holsteins. Many of these cows are very valuable animals. For this reason we were a bit afraid of the milking machine proposition at first, but now we do not hesitate for we are having far better results with the Universal than we had with our average hand milkers.

"We believe the Universal is the best machine made and we recommend it to those wanting the best machine it is possible to buy.

(Signed) F. P. COWARD,
Java Village, New York

Most Rapid, Cleanest Milker Made

"Universal Milking Machines have been in constant use here for over a year in the production of certified milk, 5 double units being in service. After having used several other makes, I say that the Universal is unquestionably the most rapid, cleanest milker made.

"Certified dairying requires the bacterial count of the milk to be below 10,000. Our count is often below 3,000. The maintenance cost is less than that of the other machines which I have used.

"There has been absolutely no udder trouble due to machine and we have never had a cow with a quarter spoiled or the lactation period shortened from using machines."

(Signed) R. T. ROBINSON,
Manager Sleepy Hollow Ranch
San Anselmo, California.

When Writing to Advertisers, Mention Hoard's Dairyman

New York Butter Market

(Continued from page 705)

tributed to a general lack of confidence in the general situation.

Privately owned creameries and centralizers must necessarily be heavy losers on the butter which they are marketing at present. Cars of 87 score centralized are selling at 42@43c, 88 score at 44@45c, 89 score at 46@48c, and 90 score at 49@50c. Even at those prices, buyers are extremely scarce. As many of the centralizers must compete with well managed co-operative creameries, which make the best butter that can be secured on the market today, it is reasonable to suppose that they are losing vast sums of money. The tendency is to sell regardless of the price offered as a feeling has prevailed of late that bottom prices have not as yet been reached. However, there are some who prefer to hold butter, believing that values will again work upward with the coming of cold weather.

On Monday of last week, extras were quoted at 59@59½c. On Tuesday there was a decline of ½c and that was followed by a drop of 1c on the following day. Because of a scarcity of fancy butter on Thursday, there was a revival of interest and no further decline took place. However, a marked weakness developed on Friday and prices again fell 1c. On Monday, due to reports that the market was strengthening in Chicago, values recovered 1c and there was an additional advance of 1c today. On the whole, a better feeling prevails in the market today than has been in evidence for some time. There are many buyers going the rounds and some are asking to see medium grade butter. Values of that class of butter have risen in the same proportion as those of extras and higher scoring butter. Low firsts and seconds seemingly are not wanted, the latter being offered as low as 39c in some instances without arousing any interest in the prospective buyer. The usual quantity of Danish butter is arriving each week and considerable Argentine butter is known to be on the water. Established quotations are: Extras (92 score), 59c; higher scoring than extras, 59½@60c; firsts, (90—91 score), 52@57c; firsts (88—89 score), 46@50c; and seconds (83—87 score), 39@44c.

W. B. LIVERANCE.

Current Feed and Hay Prices

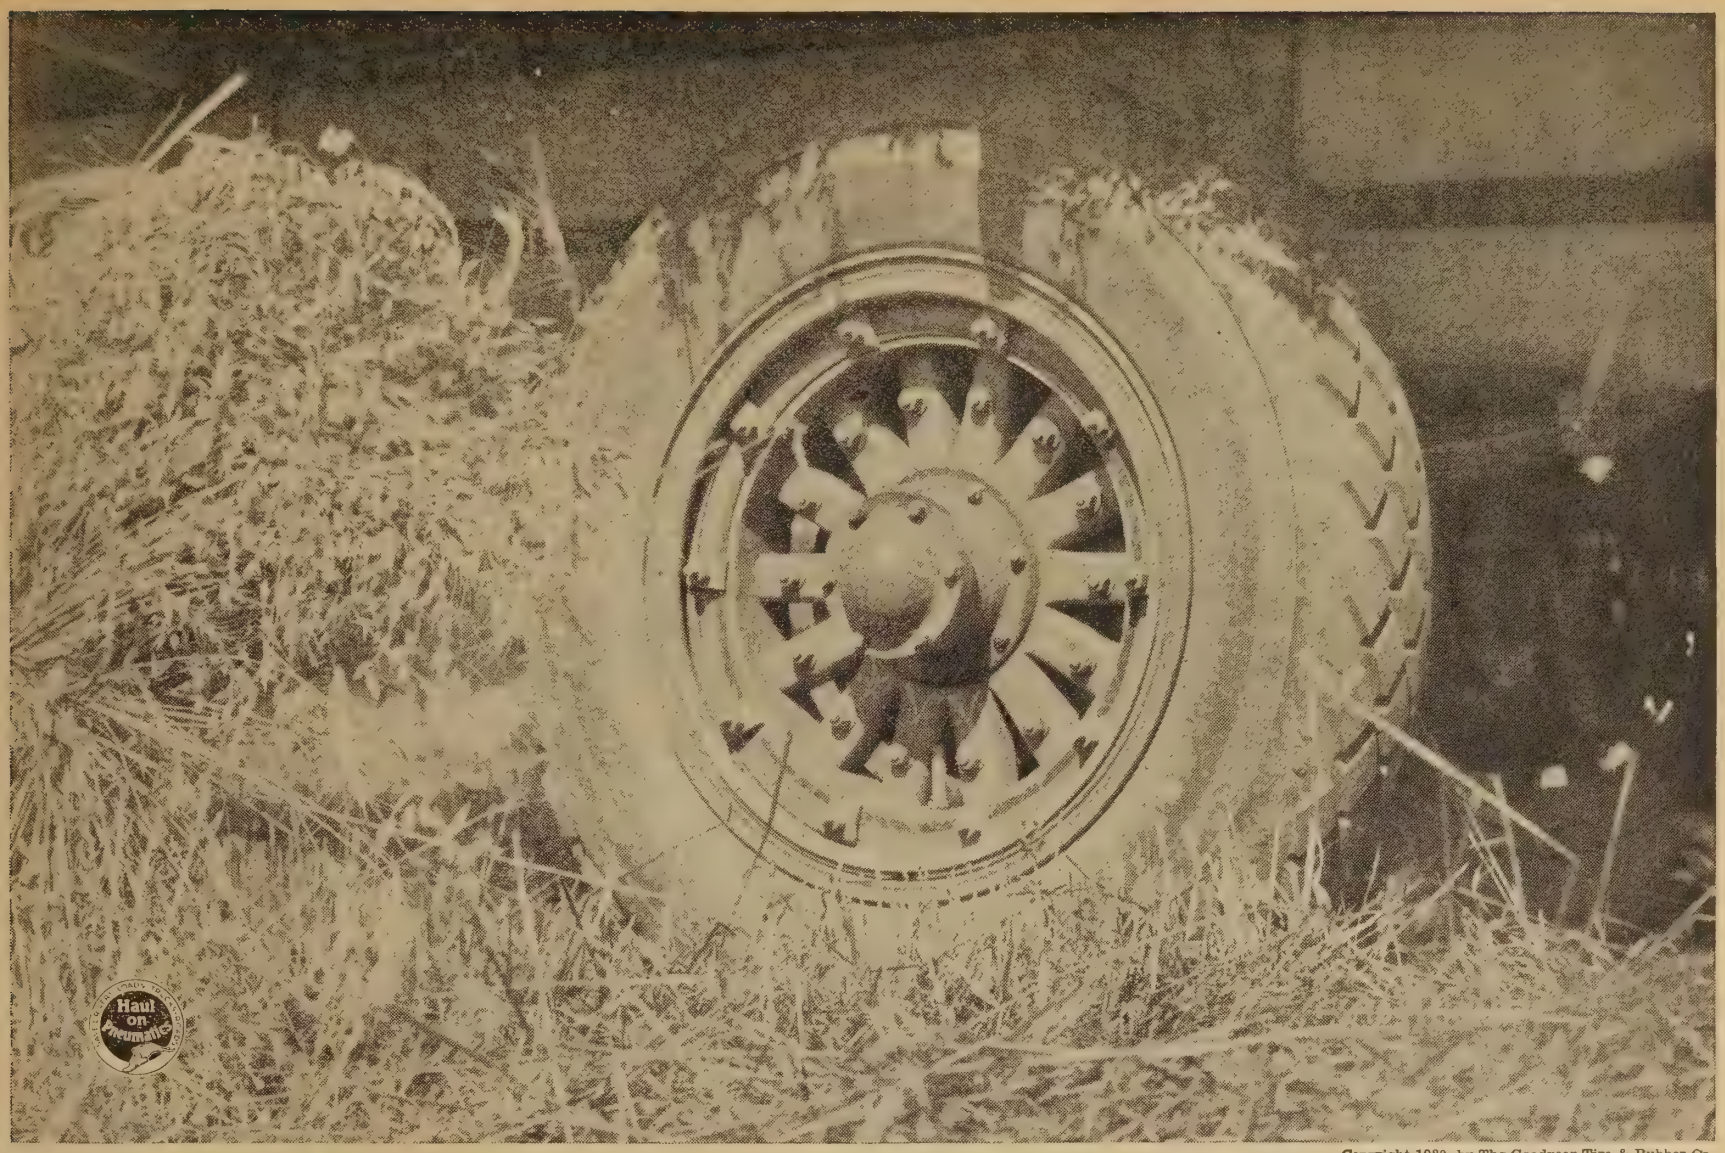
Bran Steady—Other Feeds Decline With Little Demand

[Report by U. S. Bureau of Markets]

During the week ending October 23 bran advanced slightly in the Northwest, but this was not noticeable elsewhere. Low milk prices and butter importation seem to be a factor in reduced buying.

Quotations on bran are: $29 in Kansas City, $31 in Minneapolis, $34 in Chicago, $40 in Philadelphia and New York, $38 in Atlanta, and $42 in Seattle. Middlings range from $30 in Minneapolis to $40 in New York and $48 in Seattle.

Prime, 43% cottonseed meal is quoted at $38 f. o. b. Texas common points and cake offered at the usual discount of $3 to $3.50 less, with southeastern markets finding poor sale for 36% meal at $36. The 41% meal is quoted at $40 in New Orleans, $42 in St. Louis, $50 in Chicago and Philadelphia, and $53 at Minneapolis and Boston.



Minneapolis firms are quoting linseed oil meal at three dollars less than a week ago. Supplies continue heavy, and prices at mills are one dollar lower. Fine ground meal is in light demand, but there is fairly good inquiry for pea sizes. Ruling quotations are: $59 in Minneapolis, $61 in Chicago, $54 in New York, and $56 in Boston.

Hominy feeds for deferred shipment are $1 to $2 under the market. Quotations range from $34.50 in Chicago and St. Louis to $42 in New York and Boston.

Gluten feed holds its price under the guarantee against decline. Prices range from $40 in Philadelphia to $44 in Chicago and $52 in New York.

While all beet crops have not yet been harvested, reports received from principal factories indicate a much heavier production of dried beet pulp than was anticipated. Production estimates in a number of cases range from 80% to 100% higher than they were last year. The demand for this commodity, according to large handlers, is good. While $45 is asked for October-November shipment f. o. b. Chicago, imported beet pulp is quoted at $47 c. i. f. Philadelphia. Fairly large receipts from abroad are expected in the latter market next month. Other seaboard and Gulf ports quote

(Continued on page 712)

Copyright 1920, by The Goodyear Tire & Rubber Co.

"The big Goodyear Cord Tires make a motor truck a real farm tool. I use mine to pull a hay cutter, or a rake, or an automatic loader, as well as to haul grain to the threshing machine and then to the barns for storage. The pneumatics roll through our peat bogs, 14 feet deep in places, which we use for fuel supply; teams can't go into them after rains, pneumatics can. I haul pure-bred Holstein stock to St. Paul, 80 miles, without appreciable shrinkage. Others take days to do the harvesting that I do in hours—because of my truck on pneumatics."—E. H. Kuchenbecker, Owner, Oakcraft Grain and Dairy Farm, Owatonna, Minnesota, R.F.D. No. 1

THROUGHOUT agricultural America today there is many a farmer who can make a report similar to the one given above, regarding the all-round utility and value of a truck on Goodyear Cord Tires.

Just as the application of motor power quickens plowing, pumping, spraying, grinding and other farm operations, so does truck power aided by the active pneumatics quicken farm work in a large variety of ways.

All those tons of produce, stock and supplies that otherwise require such tedious toil in handling and hauling, are rapidly loaded and whisked between farm and town on the big, smooth-going Goodyear Cord Tires.

Farm products formerly limited to selling points only a few miles away, now have ready access by means of trucks on Goodyear Cord Tires, to markets sometimes 50 to 100 miles distant.

In the most strenuous of such duty these pneumatics demonstrate the rugged strength of their Goodyear Cord construction which makes possible that exceptional reliability with which they serve.

Farmers' reports of savings and advantages obtained with pneumatic-tired trucks and other motorized equipment, will be mailed on request by The Goodyear Tire & Rubber Company, from Akron, Ohio or Los Angeles, California.

"SNAG-PROOF"
Rubber Footwear

Here's the Way to Make Sure You're Right!

IF you want to see a man real downright happy over the rubber footwear he has bought, just ask any fellow wearing the green Snag-Proof label. He'll sure tell you that it stands for the best rubber boot, shoe or arctic you ever saw in all your life. And he'll back it up by saying he's been buying Snag-Proofs year after year—ever since he bought his first pair.

That's the reason Snag-Proofs are so popular and so successful. Every man who gets Snag-Proof footwear gets permanent satisfaction in warmth, comfort and service. He never changes.

You'll have the same experience. Look up the Snag-Proof dealer in your town. Give him a chance to satisfy you. He'll take a personal interest in pleasing you. For he has built his entire rubber footwear business on pleasing a customer so well the first time that he'll come back year after year. He wants to make a permanent friend of you—and he will if you'll go to see him. Try it.

LAMBERTVILLE RUBBER COMPANY
Lambertville, New Jersey

SURFEITED WITH NITROGEN

(Continued from page 691)

at that). Has any farmer tried this remedy? The writer would not cast a reflection on the good sense of the average farmer, for surely such a proposed cure is worse than the disease.

Thinner seeding may prove especially helpful in certain cases. This permits the entrance of more sunlight which not only strengthens the straw, but proves more favorable to the young seeding as well. One really gains three points in sowing less seed on "lodging" fields: (a) A considerable amount of seed is saved, (b) better yields are assured, and (c) the clover seeding is given a better chance. A few years ago one peck of barley was sown to the acre on a certain nitrogen-rich field near Burlington, Wisconsin. (Every other drill hole was closed when seeding.) At threshing time a yield of more than fifty bushels per acre was realized—and, in addition, the alfalfa seeding came through in fine shape. Had the usual amount of grain been sown per acre the yield probably would not have been more than about thirty bushels or less;—and furthermore, the alfalfa, no doubt, would have been smothered by the lodged grain. The thinner-seeding measure applies particularly well to certain brown and dark gray silt loams not overly supplied with organic matter, but on which, nevertheless, is developing the lodging problem. A narrow-leaved oat or barley may prove helpful. Here is a problem for the plant breeder, or, in fact, for any keen-minded farmer.

Curbing the Nitrogen Supply

Probably the most effective way to strike at the lodging problem on nitrogen-rich soils is to curb the supply of available or usable nitrogen. It is possible for the farmer, with simple means at his command, to actually control or regulate to a considerable degree the amount of available nitrogen for crop use.

Before proceeding, let us consider for a moment a few fundamental soil facts in order to make more clear this particular point:

Fact number one: Practically all the nitrogen an average soil contains is held in the form of organic matter.

Fact number two: The nitrogen in the organic matter is tied up in complex compounds too complex and insoluble to be absorbed by plant roots, —except possibly in only very small amounts.

Fact number three: Before a crop like corn or oats can secure any nitrogen from the organic matter it must undergo decomposition which makes possible the formation of usuable nitrogen.

Fact number four: The busy bodies in the soil which furnish usable nitrogen to the crop are the tiny organisms which inhabit any productive soil. Without these microscopic organisms in the soil, it would be just as impossible, under natural field conditions, to produce a crop of oats as by sowing it in glass sand and feeding it gravel stones, shingle nails, and liquid air.

Fact number five: These beneficial soil organisms are favored in their activities in furnishing available nitrogen when a given soil is sufficiently supplied with organic matter, with moisture, and with air. Loosening a moist soil rich in organic matter permits of the free entrances of air, and under these conditions a liberal supply of usable nitrogen is produced. On the other hand, if that same soil were left in a compact condition only a limited amount of available nitrogen would be formed.

Now let us return to the question of curbing the nitrogen supply as a control measure for the lodging problem. This takes us at once to the preparation of the seed bed. Do you plow for small grains? A Scot farmer on reading this will undoubtedly reflect that there is at least one fool bigger than the usual run, and that is the questioner. By the way, the writer was reared under the strait discipline of a Scotch farmer. Yes, he plowed for everything, and what he couldn't touch with a plow he spaded. That early training didn't do any harm; but the author had to change his ideas considerably in recent years as regards plowing for small grains. Under certain conditions he no longer hesitates to recommend shallow disking instead of plowing for oats or barley.

Take a corn stubble field on which lodging is the common rule. On one-half of this field, at seeding time, prepare the seed bed by shallow disking. Plow the remaining portion about five or six inches deep. Now sow the same variety of oats and sow the whole field the same day. Any farmer can perform this simple stunt. Many have done it, though in most cases accidentally. It's ten to one that the crop will lodge badly on the plowed area. Why? Because in the plowed and thoroughly loosened soil a liberal supply of available nitrogen is formed; whereas in the soil left compact the formation of available nitrogen is retarded or curbed. Figure three is a splendid illustration of the difference in the formation of available nitrogen in the soil, as shown in the growth of corn.

Production Economy Augments Profits

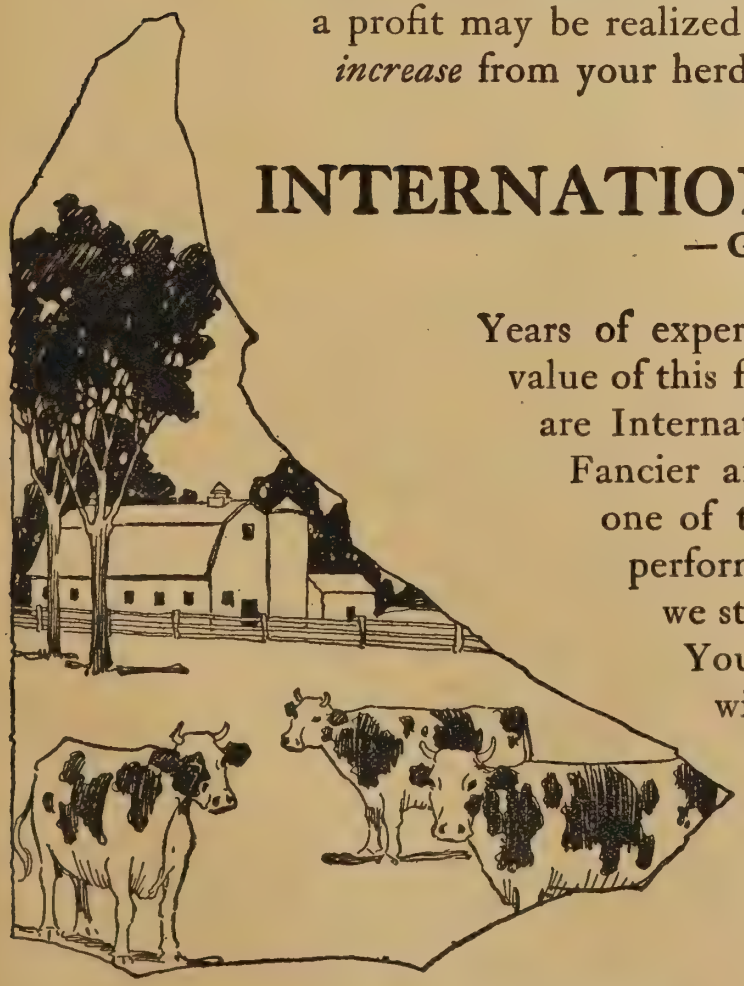
One spring morning two years ago while talking with one of Wisconsin's progressive farmers down near the Illinois line, the writer observed a neighboring farmer and his hired man begin the day's work in an adjoining corn-stubble field. One man had a disk harrow, the other a broadcast grain sower. The man with the sower jumped on his machine and began scattering the grain over the uncultivated stubble field. The second man followed with the disk harrow, covering the seed. Those two men made some time putting that crop in.

"Now, just look there," said my farmer friend pointing in direction of the modern sowers. "That seems to me a very shiftless way of farming. I can never bring myself down to such slip-shod methods as that."

There we had two conflicting opinions with only a wire fence in between. The one farmer didn't seem to have any doubts about scattering seed over unprepared ground. The other farmer had what might be termed a college idea concerning the preparation of an excellent seed bed. "I am for plowing," said he. "But," he added, "what puzzles me is why that farmer over there gets better yields than I do. It seems like putting a premium on laziness. I know my land, through manuring, is in better shape than his. His grain stands up, mine goes down."

It seems strange that this farmer finds it difficult to bring himself to giving his neighbor's method, or a modification of it at least, a fair trial even on a small area. He talks about the expensive field operations which are reducing profits; and he often wonders at certain seeding results—success vs. failure in the same field. Is there any reason why a farmer should feel shy about adopting simpler sowing methods when it cuts a big figure in economic production and

(Continued on page 719)



Back of the Guarantee

A guarantee, like a note or a bond, is worth as much as the party undertaking the obligation. The guarantee reproduced above is worded in very definite terms. Back of this warranty of performance is a responsible $1,000,000 organization. The character of this organization backs up the terms of this guarantee as solidly as the U. S. treasury backs up its promise to pay you hard cash for the paper money you hold.

The International Sugar Feed Co. really guarantees you bigger profits in the above document. But before we can help you, you must *help yourself*. Get away from the idea that cows are simply maintained through the winter that a profit may be realized from pasturage the following summer. Expect an *increase* from your herd *this winter* and you will *get it* if you feed

INTERNATIONAL DIAMOND DAIRY FEED

— GUARANTEED 24% PROTEIN —

Years of experiment and practical feeding have established the value of this feed, and *all* feeds in the International line. There are International feeds for the Stockman, Hog-Raiser, Horse Fancier and Poultryman as well as the Dairyman. Every one of these feeds comes to you with a known record of performance. Upon these known records of performance we stake our capital, and our reputation as feed builders. You *must be satisfied* with feeding results as compared with your expenditure for feeds or you will find us here to even up the difference.

Ask your dealer for International Feeds, whatever your feeding requirements. He should be able to supply you with any feed in the line. If he is not, write to us for information and full advice on any feeding question.

INTERNATIONAL SUGAR FEED CO.

MINNEAPOLIS, MINNESOTA **Mills at Minneapolis and Memphis** ***Live Agents Wanted***

Current Feed and Hay Prices

(Continued from page 708)

around $50. In Los Angeles dealers are asking $41 per ton. In the last named market coconut meal is quoted at $42 and rolled barley at $48.

Demand for hay continues light and market receipts have sharply declined. No. 1 timothy is quoted at $24 in Minneapolis, $22 in Kansas City, $31 in Chicago, $34 in Philadelphia, $37 in Boston, and $40 in New York. Mixed clover and timothy rules from $1 to $3 lower than clear timothy, with straight clover a dollar cheaper.

No. 1 alfalfa is quoted at $25 in Kansas City, $21 in Omaho, $23 in Seattle, $30 in Chicago, and $34 in Atlanta.

Coming Events

Nov. 9—11, 1920, Wisconsin Buttermakers' Association meets in Madison. Secretary, H. C. Larson, Wisconsin.

Farmers' National Congress, November 16 to 19, at Columbus, Ohio. A. P. Sandles, Sec., Columbus, Ohio.

Leavenworth County Breeders'

Third Annual Sale

Registered Holstein-Friesian Cattle

At the New Sale Pavilion

Monday, November 22, 1920

10 Consignors have selected the good ones from their herds.
85 Head will sell

40 cows, a few fresh, many heavy springers, 30 coming two-year-old heifers bred to 30-lb. bulls. Among them are 7 sisters as handsome a lot as one ever saw.
10 heifer calves from record bulls.
5 bulls ready for service, from high record bulls and A. R. O. cows.
All cattle tuberculin tested and sold with 60-90 day retest privilege.
Come to this sale. A good place to buy.
Sale begins at 10 a. m.

Write today for catalog to

W. H. Mott, Sales Mgr., Herington, Kansas

Attention!

Sale consignors and breeders intending to hold dispersal sales.

Let an experienced showman fit and show your animals in your next sale.

An animal in sale shape gets the money, and I can do it.

My rates are reasonable and I can make money for you.

Write for full particulars and dates.

Address Box 439, Care Hoard's Dairyman

Sons of a 36-lb.—1315-lb. Sire

They are sons of Dutchland Creamelle Denver Prince. His sire is a 30-lb. 1,028-lb. grandson of Colantha Johanna Lad and his dam, the highest record daughter of the same sire, with 36 lbs. in 7 days, 1,315 lbs. in a year.
They are from tested (records up to 20 lbs.) and untested dams — Good producers rich in the blood of Mooie Mutual De Kol and King Segis Pontiac.
The calves are from 2 to 8 months old. Priced right.

Jefferson County Asylum, Jefferson, Wis.
W. E. Voigt, Supt.

Bull Calf

Sire: Pabst Pontiac Hengerveld, 34-lb. son of King Pontiac Champion out of a granddaughter of Hengerveld De Kol. Dam: A 19-lb. two-year-old out of a 2,365-lb. junior 3-year-old. This heifer promises to materially increase her record as a three-year-old. This splendidly bred fine individual is priced reasonable — buy him now as he will be worth more when dam makes her 3-year-old record.

October Milk Prices

The following table from the U. S. Bureau of Markets' report presents a comparison of the net prices received during October by producers for fresh milk (test 3.5%) f. o. b. local shipping points or milk plants operated by fluid milk dealers:

Sections	Range of Oct. prices per cwt.	Comparison of average prices 1920 Sept.	1920 Oct.	1919 Oct.
United States	$2.10–$6.16	$3.77	$3.80	$3.68
New England	2.75– 5.05	4.29	4.29	3.95
Middle Atlantic	2.84– 4.49	3.85	3.85	3.39
E. North Central	2.28– 4.09	3.53	3.56	3.62
W. North Central	2.10– 4.42	3.11	3.15	3.13
South Atlantic	3.48– 6.16	4.27	4.46	4.49
E. South Central	2.85– 4.80	3.44	3.53	3.67
W. South Central	3.14– 5.24	4.35	4.54	4.45
Mountain	2.62– 3.49	3.27	3.25	3.12
Pacific	3.38– 4.44	3.79	3.88	3.38

Producers' and Consumers' Prices

Prices paid producers during October averaged 13c higher than for September and 9c higher than a year ago. The next table shows for certain representative city markets the prices of standard grade milk (Grade B, test 3.5%) received by producers and paid by consumers during the month of October:

	Producer receives per cwt.	Consumer pays per qt.	Butterfat allowance per lb.*
Birmingham, Ala.	$3.15–4.07	$.20	$1.00
San Francisco, Cal.	4.51	.17	.30
San Diego, Cal.	4.71	.16	
Denver, Colo.	3.15	.13	.90

Seattle, Wash.		.14	
Wheeling, W. Va.	4.36	.18	
Milwaukee, Wis.	3.75	.13	flat
Cheyenne, Wyo.			

*In actual practice this allowance is made on the basis of a certain price per hundred of milk of a certain test, one-tenth of the price per pound fat being paid or deducted for each one-tenth per cent above or below the stipulated basic test. Where the word "flat" appears in this column, it means that no allowances are made for butterfat content but the milk must not be lower in test than legal requirement and must not be adulterated or skimmed.

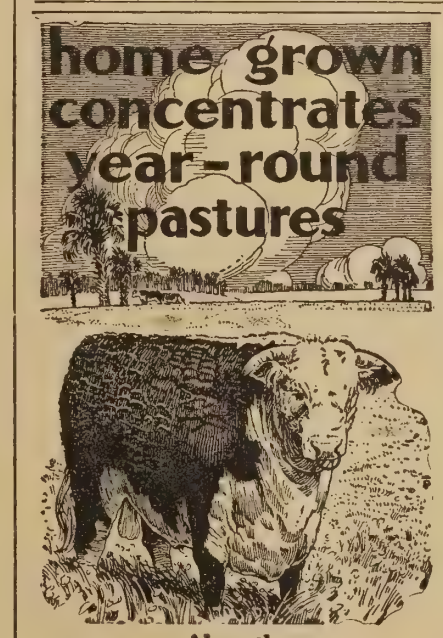
The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price. In certain cities the prices given apply only to that portion which is considered as the producers' average production, the surplus being either handled by the producers' association or the dealers at somewhat lower prices.

The prices given are here reduced to the comparable basis of 3.5% fat, as different cities vary from 3% to 4% as the basic fat test. To reduce the prices per hundredweight to either a gallon or a quart basis divide by 11.63 or 46.33, respectively.

The prices paid by consumers are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in most cases is for pasteurized milk.

Country Shipping Stations

Prices per cwt. paid at the dealers' country receiving stations or at producers' railway shipping plants are given as follows for October:



New Haven	$4.01	Kans. City	$2.15–3.57
Washington	3.90	Lincoln	2.62
Jacksonville	3.67	New York	3.85
Chicago	3.70	Albany	3.94
Indianapolis	2.42	Cleveland	3.60
Baltimore	3.28	Cincinnati	3.30
Boston	4.09	Pittsburgh	3.50
Detroit	3.80	Philadelphia	3.81

Retail Prices

The following table gives for a few cities the retail prices of milk, cream, and buttermilk for October, 1920:

Cities	Special milk per qt.	Certified milk per qt.	Butter milk per qt.	Cottage cheese per lb.	Light cream* per ½ pt.
	Cts.	Cts.	Cts.	Cts.	Cts.
Boston	21–25	28	22	26	16
New York	21	28	12	20	22
Buffalo	17	26–30	10	15	23
Philadelphia	17	30	13	8	18
Pittsburgh		25			19
Cleveland	20	32	15	18	20

Portland		21	14		17
Spokane	16		15	18	15–17
San Francisco		25	17	20	18

*Cream testing 18–20 per cent butterfat.

Along the

Seaboard

the south's newest great railway

Productive prairie land along the Seaboard, with pasturage every month, can often be bought for but little more than interest Western farmers pay on mortgages.

Soy beans, velvet beans and peanuts furnish an abundance of rich home-grown concentrates. Instead of housing cattle for months and feeding them hay, silage and concentrates, they are turned into velvet bean pastures and rapidly get into market condition. Wonderful gains are made and splendid flavored meat. In the "Black Belt" of Alabama and in Georgia alfalfa flourishes.

Shoats hog down the peanuts, making big gains at lowest cost per pound, one acre of peanuts equalling two of corn.

Ewes in Florida and other States drop lambs from November to January. Early pastures are provided by sowing oats, rye and rape, and the farmers have a well-grown fat 65 lb. by April — get "hot-house" prices for pastured lambs.

Stock-raising, general farming, fruit and vegetable growing are paying big profits. Write me for booklet and information. Advise kind of farming in which interested.

J. M. Jones, General Development Agent
SEABOARD AIR LINE RAILWAY
Room 122, Royster Building, Norfolk, Va.

What Does Your Feed Cost Per COW?

What does it cost you to feed your cows? It depends entirely on **how** and **what** you feed them. The only way you can figure feed costs is to deduct the cost of feed from the value of milk production.

If you feed your cows sparingly and try to economize on feed, your feed costs will be high because the first use made of the feed your cows consume goes to provide bodily maintenance and leaves little for milk production.

But if you feed the **right kind** of feed liberally—give your cows sufficient to provide them with both bodily maintenance and milk producing nutrients, your feed cost will be low. That's why

SCHUMACHER FEED AND BIG "Q" DAIRY RATION

fed according to the Schumacher Feeding Plan have become so universally popular with dairymen and farmers everywhere.

Schumacher Feed, the world's greatest carbohydrate feed is composed of the **right** kind and variety of grains to supply bodily maintenance—to keep cows in tip top shape physically—provide them with energy—stamina, etc. while Big "Q" Dairy Ration, the renowned high quality protein ration, supplies the needed food nutrients to be converted into milk.

This combination fed liberally **reduces feeding costs** because it **increases health condition and milk** production. You can prove it to your own satisfaction and profit by making a test with any cow. The results will be gratifying and make you a strong advocate of the Schumacher Feeding Plan—the plan that costs **less** because it produces **more**. Ask your feed dealer.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

A Worth While Show

Did you notice what a prominent part the young fellows played in the success of the show? If you were a close observer at the ringside while the judging was taking place you saw that many of the animals were being held by boys. In a number of cases these were the actual property of the lads, members of the Grove City National Pure-bred Dairy Cattle Club. In other cases the boy was lending a hand in showing dad's exhibit.

If you had been behind the scenes as was the writer you would have

JOHN McCUNE, JR., PRESENTS TROPHY TO WILSON McCLELLAND

been still more impressed with the interest the boys were taking. With the early arrivals on Friday afternoon from the edges of Grove City community came a quiet delegation of boys. There were Davis and Humphrey and Studebaker from Butler County and Westlake and Hassel from Mercer, and several others. This bunch slept together in the Young Farmers' Headquarters tent and the air was full of talk about the cattle and the show. Some time in the wee small hours of the morning Davis crawled out and made a round of the stalls to see that his Jerseys were all comfortable, and the whole bunch were up and had eaten breakfast by five o'clock.

The Grove City National Pure-bred Cattle Club has been an important part of the great dairy development that has been taking place in Grove City community. It was established in June, 1917, when Grove City National Bank, co-operating with the Mercer County Farm Bureau, brought in for the boys and girls a carload of fifty-three pure-bred Jersey, Holstein, and Guernsey calves. The heifers found their way into the hands of boys and girls within the creamery territory in Mercer, Butler, and Lawrence Counties, and in the supervision of the club members the county agents of the three counties have taken part.

The club was started and has continued as a permanent breeding organization. An effort is made to have the original animal and her female offspring stay right in the club. So far there have been very few sales of either and as far as has been possible the boys and girls have secured through the cow testing associations complete production records. The disturbing effect of the war was felt in the club as in many other agricultural activities and regular meetings were not held. A plan is under way now for meeting in community groups for the checking up of records and the discussing of feeding and breeding problems.

The members of the dairy club have been always encouraged to exhibit their animals at the show and picnic of the Accredited Herd Association. Special prizes have been provided by Grove City National Bank and they have also shown in the open classes. It is obvious that in a lot of fifty animals purchased as calves under six months old not all would develop as show individuals and yet a remarkably large number of the heifers and their offspring have done so. In the class for Guernsey cows over three years, Tom King has taken first place with his club heifer consistently and, furthermore, she has never been beaten in any of the fairs at which she has been shown.

At this place we would like to say a word or two to the members of the club who did not exhibit at the show. It is something of a task, we know, to fit a heifer for the show ring and drive or haul her several miles over dusty roads, but in the long run it pays big dividends to the boy or girl who does it. Among people who follow the show ring there is a maxim that two people get most of the good from any exhibit—the judge and the exhibitor. When the time rolls around for the next show let everybody appear with something in the show ring.

The stock judging contest for members of the dairy club has been a feature of the picnic. It was run this year under something of a handicap because the regular judging program lasted until nearly one o'clock. This made it necessary to confine the work to Holsteins and Jerseys, and the Guernsey boys were disappointed in not having an opportunity to work on their own breed. Despite this, a live group of club members, including a team from Armstrong County who were visiting Mercer County to get some experience in preparation for their trip to Springfield, worked throughout the contest under the direction of Professor A. A. Borland, head of the Dairy Husbandry Department of State College.

The John McCune, Jr., silver cup, a fine circulating trophy to go each year to the contestant having the highest total score, added greatly to the interest of the contest. Wilson McClelland was the winner but he was very closely pressed by several others. It will always be considered a great honor to hold this cup. Mr. McCune is one of the big men of Grove City and his interest in the young fellows who are going to make dairy history in the community is greatly appreciated by the club.

A new feature of the picnic this year was the active participation of the Young Farmers' Club. This is an achievement organization drawing membership from three sources: the club work, the vocational schools, and college agriculture courses. In order to be eligible a fellow must make an outstanding achievement in some phase of agriculture. Most of the members of the dairy club have already qualified and several have taken out membership in the Young Farmers' Club. This year the club brought down one of the big tents and part of its equipment and established a headquarters where members of both clubs could mingle. They also ran a stand at which ice cream and milk drinks were sold. The Young Farmers' Club has had many pleasant gatherings around Grove City and it is hoped that this plan of coming together at the picnic may be made a permanent one.

All this active interest on the part of the younger generation speaks well for the future of the dairy industry around Grove City. The community is committed to the development of a big program and much of the burden should fall upon the young shoulders. In plain arithmetic 15 plus 50 is the same as 50 plus 15. In the development of a community in pure-bred live stock, if the problem is a man starting with pure-breds at 50 with 15 years to go and a boy at 15 with 50 years to go, everybody will agree that the sums will be widely different.—By C. G. McBRIDE, State Club Leader in Grove City National, Pennsylvania.

GROVE CITY JUNIORS ARE LIVE WIRES

The Food Value of Milk and Its Products

The following is a first prize essay written by Melba B. Connor of Minnesota, winning in open state competition among boys and girls under twenty years:

Every state has its slogans and one of Minnesota's slogans is "Use more milk". Minnesota realizes that if her people understand the food value of milk, they will use more, and her citizens of tomorrow and even of today will be stronger and thereby better fitted to aid in the development of the state.

Milk is a nourishing food, rich in body building and energy producing substances. For this reason it is often spoken of as a perfect food. The real value of milk is determined first by what the body needs from food, how the food meets these needs and, finally, whether it may be replaced equally well by some other food.

Food taken into the body is used for energy, for building material, and for the substances which regulate the body. Before a well nourished body can be obtained, all these needs must be met adequately. The value of the food to the body is measured by its ability to supply some or all of these needs.

Two of the main sources in milk are milk fat and milk sugar. The fat of milk contains an unknown substance essential for growth and occurring in but few foods in amounts large enough to promote normal growth. Milk sugar is of importance in the changes which take place in the food canal, especially in the case of the infant and the young child.

The building material of the body includes the substances used to build and keep tissues in repair.

Milk is a superior source of protein especially where growth is taking place. The amount of protein required in the daily diet may be less if milk forms a considerable part of the diet than if such foods as cereals are mainly depended on.

Milk as a source of protein can be replaced more easily than milk as a source of lime. Comparatively few foods contain the amounts that can be eaten and digested by a child in a sufficient amount to provide for normal growth and health. Milk is the richest in available lime of all common foods and its absence or even its limited use may prove unsafe. Even if all members of the family are adults, a thought must be given to provide lime in other foods, if less milk is used, or the health of the adult is impaired.

Milk is comparatively rich in phosphorus as well as in lime. Milk is low in iron and when it forms a considerable part of the diet, should be in connection with foods rich in iron. In spite of the low iron content, it is an important food to use when the blood is low in iron, because lime in food increases the ability of the body to utilize iron.

Protein, phosphorus, lime, and iron not only serve as important materials for building the body, but also play a part in regulating its activities. Salts, acids, and flavors are all concerned in regulating body processes, and some of these are also found in milk.

Besides the nutrient substances such as protein, fat, starch, lime, acids, salts, and flavors, there are other dietary factors essential to health and growth. Two of these factors seem to be essential to right nutrition. One of them occurs dissolved in the fat of certain foods; the other can be obtained from certain foods dissolved in water. The one that occurs dis-

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. _____ State _____ R.—

solved in the fat of certain foods, or more easily thought of as the fat-soluble factor, promotes growth and is essential to it. It does not occur in all fats. Milk fat as it occurs in milk and butter and perhaps cheese, the fat in egg yolk and cod liver oil, contain the necessary factor. Forage foods, such as alfalfa and cabbage leaves, seem to contain it in comparative abundance. It seems to be absent in all vegetable oils and lard. Therefore, since we have a limited capacity for forage foods and since this factor is essential in the diet of the child and to a great extent in the diet of the adult, we must depend upon milk, eggs, and meat to supply this factor. Meat contains this fat-soluble in lesser quantity than does milk fat.

In the absence of the water soluble factor, growth is prevented and serious illness results.

The protein in one quart of milk is equal to that in seven ounces of sirloin steak or four and three-tenths eggs. The energy produced by one quart of milk is equal to that produced by eleven and three-tenths ounces of sirloin steak, or nine eggs.

Butter is especially valuable for children, because it supplies the fat which is so essential in a palatable and easily digested form. Oleomargarine may have the same energy value as butter, but is not a source of the fat-soluble factor.

Cheese is said to be a concentrated food, because a pound contains more food value than two pounds of meat. Ninety-five per cent of its protein is digestible, and ninety per cent of its energy is available.

Buttermilk also is a nutritous food and a harmless stimulant which is valuable in the dietary of children and invalids.

Ice cream, the delightful and satisfying dish, ranks high as a food and is eaten by the sick and the well, the child and the adult.

If we possessed a valuable gift that had as many worthy points as milk has we would treasure it highly and watch it jealously, so it might come to no harm. Milk is a valuable gift—our normal health depends upon it. Surely such a gift should not be wasted but utilized to its utmost extent. If we waste it we rob not only ourselves, but others.

Junior Letters

Hoard's Dairyman Juniors:—I am 12 years old. My sister and I have five rabbits. We want to sell them for 75 cents apiece. We have four ducks, two young ones and two old ones, and want to sell them, too. We are going to move this fall. My father sold a calf yesterday for $200. He sold three others for $100 each. My sister and I have 45 tomato plants and lots of tomatoes on. I am in another club called Beech Grove Girls' Canning Club. There are six girls and a leader. My brother was in the pig club last year. He had two pigs and sold one for $60. He kept the other one. If any one of the juniors wants to write me my address is R. F. D. No. 8, Mansfield, O.

Frances Doolittle.

Hoard's Dairyman Juniors:—I am a junior 15 years old. I had a grade sow nine months old and it weighed 284 pounds. I traded her for a pure-bred Duroc-Jersey sow. She is due to farrow about the middle of September.

We have a good crop of apples this year. We have Winesaps, Delicious, Rome Beautys and Winter Bananas.

Washington. Keith Brooks.

Hoard's Dairyman Juniors:—This is my first letter. I have read the juniors' page in the Hoard's Dairyman for a long time and like it.

I am 14 and in the first year high.

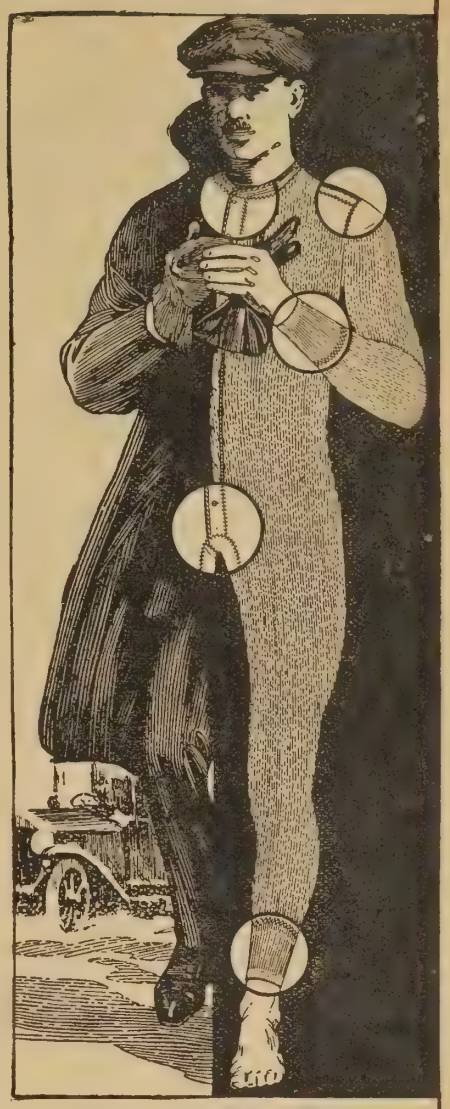
I live on a farm and work for a family by the name of Smith. Mr. Smith works 200 acres of land. He has 24 head of cattle, 16 of which give milk. He has a registered bull and some of his cows are registered. He has three horses, two colts, and two mules.

This summer I helped Mr. Smith with the haying. We had a side delivery rake and a hay loader. I did most of his raking and drove on the hay fork and wagon.

We also have 7 rabbits. They are Flemish Giants.

We raised over 60 chickens this year.

Mr. Smith has a silo.



I will close as my letter is getting long.

New York. Eva Harrington.

It pays to put underwear money into "HANES"

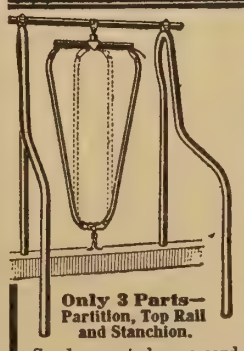
—bigger value, longer wear and greater comfort!

HANES
ELASTIC KNIT
UNDERWEAR

FOR years "Hanes" winter underwear for men has proven itself to be the *national standard.* Its popularity extends from coast-to-coast! It wins on merit! Your confidence in every "Hanes" garment can never be misplaced. *"Hanes" guarantee proves that!*

"Hanes" underwear is made in heavy and medium winter weight union suits and heavy weight shirts and drawers. The medium weight union suit, new this year and illustrated in this advertisement, is exceptional value. It is made of full combed yarn, is silk trimmed and carries a yellow Hanes label.

"Hanes" Union Suits for boys



duplicate the men's Union Suits in important features with added fleeciness. They stand the stiffest wear and the hardest wash. Sizes 20 to 34, covering ages from 2 to 16 years. Two to four year old sizes have drop seat. Inspect these remarkable "Hanes" garments at your dealer's. If he cannot supply you, write us.

New York Farm Agency, Westfield, New Work, specializes dairy stock farms. Westerners buying fast. Best bargains on earth. 8-spl

Free map and list land bargains near Twin Cities. BAKER S-76, St. Croix Falls, Wisconsin. 6-spl

Where dairy farming is profitable—There are localities in the South where, on account of the rapid development of industrial cities and towns, supplies of dairy products are short and prices are high. In these same localities long grazing seasons and winter cover crops cut down feeding costs and all conditions are exceptionally favorable for profitable dairy farming. Good improved farms can be bought at prices much lower than are asked for similar lands in other parts of the United States. Buy a Southern dairy farm now while prices are still low, make money and build up a valuable property. Forr full infromation write to J. C. WILLIAMS, Manager, Southern Railway Development Service, 1302 Pennsylvania Avenue, Washington, D. C. 14-spl.

If interested in dairying on the Pacific Coast, where climatic conditions are right, communicate with Pacific Real Estate, Chehalis, Washington. 16-2

Do you know CURTIS SERVICE?

YOU can now have true architectural beauty and unusual conveniences in the house you build at a cost no greater than you would pay for the commonplace.

Curtis Woodwork—built-in furniture for the living-room, dining-room, bedroom, and kitchen; and doors, windows, stairways, porches, and "trim" for the inside and outside of the house—is made in standardized designs and standard sizes.

Beauty, Character, and Economy

Large quantities of every item of Curtis Woodwork are manufactured at the same time. Highest-grade lumber only is used. Rigid inspection and skilled craftsmanship are a part of every unit made. The result is Curtis Woodwork—for more than fifty years famous for its beauty, reliability, and exceptional value.

Trowbridge & Ackerman, the famous residential architects, created all Curtis designs. They also planned for us more than two hundred different houses. These ideal houses range in size from three-room cozy cottages to eight-room homes.

Beautiful portfolios, describing illustrations and showing the floor plans of these different homes, can be procured by you without cost, through your local Curtis dealer.

Write for Illustrated Portfolios

If there is no Curtis dealer in your town, send us 25c in stamps (50c in Canada) and the portfolio you desire will be sent you direct. Ask for "Better Built Homes" Volume VI, if you are interested in houses of three, four, and five rooms; Volume VII, for houses of six, seven, and eight rooms; Volume VIII, for houses especially designed for farm use.

In any event, whether you are ready to build immediately or whether your home is still in the "dream" stage, be sure to get a copy of "Better Built Homes."

Clean Cows Give Clean Milk

Clipping Betty of Lakeview For Clean Milk Production

Grand Champion Brown Swiss Cow at 1919 National Dairy Show and 1920 Waterloo Dairy Cattle Congress

Clipping Dairy Cows is a Sanitary Necessity

The stabling period of winter and early spring makes clean milk production a problem. Dirt and filth lodge in the cow's long hair, and it's impossible to keep it out of the milk pail.

Progressive dairymen clip their cows at regular intervals on udder, flanks and underline. This enables them to be quickly cleaned, and lessens the danger of milk contamination from disease-breeding bacteria.

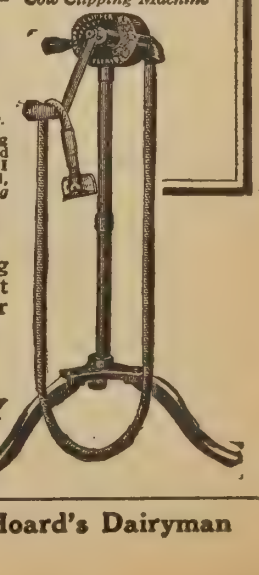
Five minutes a month with this machine keeps the hair short, and makes cleaning an easy job. A necessity for every milk producer. Urged by dairy authorities everywhere. Read these letters:

Stewart No. 1 Cow Clipping Machine

Endorsed by University

UNIVERSITY OF MINNESOTA.
DIVISION OF DAIRY HUSBANDRY.
January 15, 1920.

We have always considered the clipping of our cows *an important aid in keeping them clean* during the winter months, and have gone over our entire herd quite recently.



C. H. ECKES,
Chief Division
of Dairy Husbandry.

Improves Milk Quality

ELM LEAF STOCK FARM
Belvidere, Ill.,
April 7, 1920.

I have used the Stewart Clipping Machine for the past 10 years and it is satisfactory in every way. I find if cows are properly clipped, it aids materially in *improving the quality of milk produced.*

F. WILLIAM BLAKE.

The Stewart No. 1 is the world's standard clipping machine. Hand-operated—runs easily—strongly built—will last a lifetime. Complete, only $14. Your dealer has it, or send $2 and pay balance on arrival.

Electric Clipping Machine, 110 Volts, A. C., $80

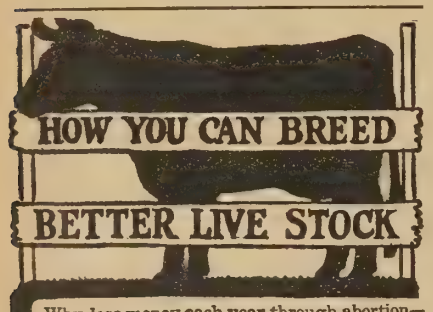
Barren Cows

Must Be Made to Breed or Your Dairy Business Will Be a Failure. They

Can Be Made to Breed

By the use of

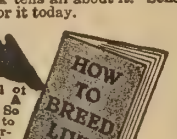


Hood Farm Breeding Powder

We say this confidently because it has been used with such marvelous results by so many breeders. Every cow at Hood Farm is treated with the Breeding Powder, and we know that it does make barren cows and heifers breed; we know that it checks and prevents abortion; we know that it makes cows clean quickly, thereby saving us hundreds of dollars annually.

Order today, mentioning this paper.

Prices prepaid $1.15, $2.75 and $5.00. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75.



C. I. HOOD CO., Lowell, Mass.

HOW YOU CAN BREED BETTER LIVE STOCK

Why lose money each year through abortion—through high-priced animals failing to breed—through animals dying at birth—through diseases and countless other causes when a little special knowledge of animal raising would stop all this, and put your live stock on a big-paying basis. The National School of Animal Breeding, through its famous home-study course, has taught hundreds how to breed more and better live stock, and how to increase their profits. Stop the leaks in *your* profits! A few minutes reading of this course each day in your own home is all that is required. Course is the result of long years of experience. Brings the school to the breeder. Written by experts. Our free book tells all about it. Send for it today.

ABORTION IN CATTLE

CAN BE TREATED SUCCESSFULLY AND YOUR COWS MADE PROMPT. REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY, Dept. A. 398-408 Columbus Ave., New York City. Reference—Colonial Bank.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Retained Afterbirth

Under normal conditions the afterbirth, technically termed the placental membrane, placentae, or secundine, should be expelled an hour or two after calving. Often it comes away earlier; frequently it is retained for many hours or days, or eventually rots away. To understand this condition it should be known by the stockman that the chorion or outer envelope of the fetus is studded on its inner surface with multitudes of little finger-like projections called villi which fit into corresponding cavities or crypts in the cotyledons or "buttons" projecting from the surface of the mucous membrane lining the womb. Minute blood vessels ramify in the villi and finally unite to form the large blood vessels of the umbilicus or naval cord through which the fetus is nourished with blood containing nutrients derived from the blood of the dam, which is carried to tiny end blood vessels in the crypts. During pregnancy and at the time of calving all of these blood vessels are engorged with blood and the villi accordingly are tightly embraced by the crypts, At the time of birth of the calf the umbilical blood vessels rupture and discharge their contained blood into the womb. This bleeding drains the villi of blood so that they immediately lessen in size and loosen in the crypts. Consequently the crypts lose their hold upon the villi of the afterbirth and that membrane falls, loose, into the womb. Then contractions of the walls of the womb take place and cause expulsion of the afterbirth. The contractions referred to sometimes are termed "afterpains".

Should anything prevent draining of blood from the villi they fail to loosen in the crypts and the chorion (afterbirth) remains in place, clinging tightly to the cotyledons of the womb which number 50 or more. Infection of the womb by germs has just that effect. The infection usually is by the bacillus abortus, of Bang, hence retention of the afterbirth commonly is due to the abortion disease. The infective germs either enter the womb by way of its os and cervix, the mucus plug of pregnancy having become pervious through accident or disease, or by the way of the blood stream of the body infected in the usual way, or possibly by injections of vaccines containing the abortion germ and employed with the aim of remedying the abortion disease. Infection by other injurious germs also is a possibility, but much less common than infection by the abortion bacillus.

If the afterbirth be left in place decomposition follows and invasion of the womb by pus-forming micro-organisms causes pus. A foul smelling, pus-containing discharge now issues from the womb and gradually carries away the broken down placental membrane. In some cases absorption of poisonous or morbid matters resulting from retention and decomposition of the placentae kills the cow, or she may only absorb a sufficient amount of such matters to cause an unhealthy, unthrifty condition of the body and failure to yield a normal amount of milk. The womb in such cases remains diseased and the condition is known as pyometra, discussed in a previous article. How to deal with the retained afterbirth will be considered later.

Worms in Pigs

In an article on "Pigs" by A. O. Choate in Hoard's Dairyman some years ago, among other things, he referred to worms in pigs and gave as his certain remedy for their eradication "a heaping tablespoonful of lye to a barrel of swill. It can be fed once every day for a week and then not given for a month or more when it may again be given for a few days". To me a barrel seems rather indefinite as to capacity. Could you ascertain for me what number of gallons would correspond with that barrel; also, what proportion of swill each pig should get as his share? I would be grateful for the information.

New South Wales. O. A. W.

A wine barrel contains 31½ gallons; the ordinary barrel used for swill contains 44 gallons, when full. We cannot, however, recommend dosing hogs with lye in slop. That treatment now is practically obsolete. The better practice is to withhold feed for 24 hours and then give in a little slop or in water carefully as a drench, for every 50 pounds of body weight of pig, 2½ grains each of santonin and calomel, 1 dram of powdered areca nut and ½ dram of bicarbonate of soda. Repeat the treatment in 10 days and at any time afterward when seen to be necessary. Keep all feeding utensils scrupulously clean and keep pigs from drinking surface water or that from old hog wallows. Sows and litters of pigs should occupy colony houses on green grazing crop to be furnished in succession from early spring until autumn.

Barrenness

I have a nice registered Jersey milk cow. She comes in heat every 9 or 18 days but she won't become pregnant. She has been milked with this calf for about 18 months. I have changed bulls with her but to no effect.

Akron, Ala. R. J. H.

It is not sufficient to give vaginal injections in such cases as the cause of barrenness is seated in the womb or ovaries. For that reason success will be most likely to result from treatment of the womb and ovaries. This has to be done by a specially trained veterinarian who has the necessary instruments. The womb has to be opened and perfectly cleansed and disinfected until in normal condition. The ovaries may also have to be treated by manipulation through the wall of the rectum to break down cysts or remove a persistent yellow body. Infection by germs of the contagious abortion disease is the cause of a majority of cases of barrenness and it is to destroy such germs that the treatment is given. Meanwhile flush out the vagina daily with a lukewarm, boiled water containing 30 grains of permanganate of potash to the gallon.

Surfeited with Nitrogen

(Continued from page 710)

in net profits per acre and per man?

It is not to be understood that disking is to be recommended in preference to plowing on all soils. Probably most soils need plowing for best results. On the heavier soil types of medium fertility fall plowing probably proves best for oats and barley. On soils of low fertility spring plowing is to be preferred. Special consideration should be given certain rich fields of alluvial origin in narrow valleys because of the weed problem. To give the weeds as much set-back as possible, shallow to medium plowing is recommended immediately prior to sowing. The seed bed, however, should be made as firm as possible even before planting.

Much more can be said on this question, and more definite information should be found out as touching directly on the lodging problem and on certain phases of it. It is the aim in this talk to focus more attention on the points herein discussed so that farmers may become familiar with them through study, field observation, and experience.

Washington Cattle Win at Western Shows

HOARD'S DAIRYMAN:—A show herd of 27 dairy cattle from the herd of the State College of Washington has been shown at three western fairs under the direction of Professor E. G. Woodward. At the Spokane Interstate fair, the herd of eleven Holsteins, eight Ayrshires, and eight Jerseys took fourteen championships; at the Walla Walla Fair, seven championships, and at the Yakima, five championships. The entire herd was bred on the State College farm with the exception of the three herd sires and one Holstein heifer. The herd was fed and managed by J. A. Knott, a 1920 graduate of the State College.

Washington. EDWARD C. JOHNSON.

Remember that standing timber will keep; it can wait over a period of low prices without rapid deterioration.

Butter Manufacturers to Meet

The annual meeting of the American Association of Creamery Butter Manufacturers will be held on November 9th, at 9:30 a. m. on the mezzanine floor of the La Salle Hotel.

A very elaborate program has been arranged. Experts will discuss different subjects. Among the things that will be discussed will be dairying from the farmer's standpoint, cement, and its relation to the creamery and dairy industry, the milking machine as a factor in dairying by an expert from New Zealand, the efficiency of churning or the loss of fat in buttermilk, the benefit of grading cream by an expert from Northwest Canada, and improving or building up the dairy herds by good sires. The future outlook for business will be discussed by a prominent business man at the close of the luncheon hour.

All creamerymen are invited to this meeting. We are expecting a large attendance from many states.

The association has just engaged Professor J. W. Mitchell of Canada. Professor Mitchell is a graduate of Queen's University, formerly Professor of Dairying at Manitoba Agricultural College, and later has been Professor of Animal Husbandry and Superintendent of Dairying in the maritime provinces. He comes to the association very highly recommended. The association expects to take up a lot of investigational work. This work will be carried on by Professor Bouska and Professor Mitchell in connection with the chemists in the association's laboratory. G. L. McKAY, Sec.

Minnesota Grade Guernseys Average $211

At Floyd Wilson's sale of Guernseys in Minnesota recently, his herd sire, a grandson of Glenwood Main Stay, sold for $400. His grade cows, which were well marked and of good conformation, averaged $211. Yearling grade heifers sold for $125. The high prices reached were in proportion to the quality obtained through crossing a Guernsey bull on grade cows.

"Tom, Tom, the piper's son,
Stole a pig and away he run.
Thomas, leave that pig alone,
Join a pig club, raise your own!"

William B. Hale, Pres., Acqueduct Bldg., Rochester, N. Y.

Yearling Bull for Sale
Dropped June 21, 1919, solid fawn color, well grown, well bred toppy bull. Sired by a grandson of Mabel's Raleigh and Noble of Oakland. Dam is of Eminent breeding, R. of M. class AA—486 lbs. 15 oz. butter, adv. test 5.97%. This bull's pedigree is full of records and blue ribbons. For further particulars write,
W. M. KNIGHT, OAK GROVE JERSEY FARM
U. S. Accredited Herd. Eagle, Waukesha Co., Wisconsin.

Attention—
Guernsey Breeders or Prospective Breeders!
We have for sale some very high class cows that would make a great foundation for prospective Breeders, or they would make a very valuable addition to any herd.
Most of the cows have splendid A. R. records, or records in the making.
If you are looking for something of the highest quality in Guernsey breeding you cannot do better than write us.
We also have several young bull calves sired by the great bull, "Cherub's Prince", whose progeny won all the highest honors at the 1920 National Dairy Show.
Address all inquiries to Percy Jones, Farm Superintendent, Iowa Dairy Separator Company.
W. W. Marsh - - Waterloo, Iowa

Third Semi-Annual Sale of Pure-bred Guernseys

Under the auspices of the

Fond du Lac and Winnebago Counties' Guernsey Breeders' Associations

Sale Pavilion, Fond du Lac, Wis.

10:30 A. M.

Thursday, November 18

Seventy pure-bred Guernseys, eight bulls and sixty-two females. A large number of these being cows, and many of them with high class A. R. records or now under test.

Included in the sale will be the whole herd of E. V. Maltby, Midlothian, Ill., and thirty head of particularly good ones consigned by Drew Ten Broeck, McLean, Illinois.

There are also consignments from the herds of F. J. Rueping, B. F. Sheridan, E. P. Sawyer, Charles L. Hill & Son, Harry W. Lewis, Ingalls Farm Co., Wichern Bros., Wm. Illian, and W. G. Jamison & Sons.

The cows are bred to some of the great bulls of the breed including Kenilworth Gold, Admiration of Edgemoor, Superb of Edgemoor, Beauty Mar, Pencoyd Crackerjack, Pine Blossom's Cherub, and Lone Pine Illustrator.

The dams of these bulls are such cows as Quaker Maid of Pencoyd 759.72 lbs. fat, Donnington Goldie 5th 796.52 lbs. fat, E. Langwater Charity 721.54 lbs. fat, and other well-known cows.

These cattle will be sold under strict guarantee and with privilege of 60-day retest.

If you are looking for foundation Guernseys you will find them here.

Calf Clubs build knowledge and character in boys and girls. They create a community interest in better dairying and better live stock breeding. Let us tell you how to organize and supervise a Guernsey calf club in your community.

THE AMERICAN GUERNSEY CATTLE CLUB, BOX H 94, PETERBORO, N. H.

Upland Farms, Inc., Ipswich, Mass.

We are able to offer choicely bred heifers and cows for foundation herds. Animals are American bred from the best producing strains, and are bred to Langwater Cavalier No. 21012, or Upland's Sentry No. 54691, a grandson of Langwater Cavalier. Sentry's dam has 614 pounds fat as a four-year-old, and her dam has a record of 816 pounds fat in Class A.

A rare opportunity to select a few choice females and perhaps the bull that will do you the most good, is here.

W. K. Hepburn, Manager

A Good One Ready For Service

ANTON OF PROSPECT 59853
Dropped September 17, 1919
Sire—Anton's King Confidence 43517. Dam—Dona of Prospect 67924, A. R. 6540.

Anton bids fair to even exceed the size of his dam's sire, Sir Snowdoun (19252), who weighed over 1,800 pounds.

His sire has six May Rose crosses and is out of Ma Chere Confidence, who has a junior four-year-old record of 764.65 lbs. of fat.

The dam of Anton is now on her second A. R. test and she is much ahead of her previous record. This calf is guaranteed in every way.

Hoard's Dairyman Farm, Fort Atkinson, Wis.

Summit Bonny Pietertje Ormsby, Born May 9th, 1920
From this Great Cow

BONNY JOHANNA MOOIE DE KOL NO. 177916

She has a 29-lb. 7-day record as well as a 305-day record of 694.42 lbs. butter from 18,124.8 lbs. milk. She is one of our foundation cows and will be tested at next freshening, and will be put on yearly test. We confidently expect that she will materially increase her records. Individually, she is one of the best in our herd.

Sired by Sir Pietertje Ormsby Mercedes 41st

We do not need to describe him, he is best known as the $65,000 son of Spring Brook Bess Burke, "The Greatest Mother of the Breed", the only cow in the world to have a 1,000-lb. record, who also has 3 daughters with 1,000-lb. records. 41ST also has more 1,000-lb. sisters than any other bull in the world. One of his daughters was awarded Grand Championship female at the 1920 Waterloo Dairy Congress. Remember the bull we are offering is a brother to this winner.

The Gustave Pabst Farms ask that you consider very carefully this young bull if you are desirous of securing a herd sire of real merit.

Gustave Pabst's Hollyhock Farms, Dousman, Wis.

A. C. Baltzer Leaves Purdue

A. C. Baltzer of the dairy extension division of Purdue University leaves the work in the college to go with the Gossard Breeding Estate in Indiana. Mr. Baltzer during the past year has been in charge of bull association work, dairy short courses,

A. C. BALTZER

and dairy exhibits for the University. In his new position he will have charge of the sales department for Ayrshire cattle in Indiana. Mr. Baltzer is a graduate of Missouri Agricultural College and outside the period of war when he was in France, he was in charge of the dairy herd first at the University of Nevada and later at the University of Idaho.

Millet Bran

Millet bran, the offal obtained in the manufacture of millet flour, has low value as a feedstuff, according to W. H. Stroud, head of the Feed Inspection Division of the Wisconsin Department of Agriculture. This product has recently been found for the first time on the Wisconsin markets.

An analysis in the feed inspection laboratory of the department showed that it had about the same composition as oat hulls and, therefore, the feed belongs in the class with roughage, such as hays and straws and not with concentrates, such as middlings. Since the product looks very much like wheat middlings farmers are cautioned against the purchase of feed without a label giving the analysis.

SWINE

Pure-bred Duroc Jersey Gilts and Boars

Hitch Your Wagon to a Star

Tie Your Herd to the Proven Success of
Epochal Berkshires

Get a Herd Sire or a Foundation Trio

From the herd that has won more first prizes and more championships at the biggest shows this year than all its competitors put together.

Some statement, but it's true!

The Epochal Herd won 62 firsts out of a possible 106 and 23 championships out of a possible 42 at the 1920 Missouri, Illinois, Iowa, Indiana, and New York State Fairs, the Eastern States Exposition at Springfield, Mass., and the National Swine Show.

The Epochal herd won in 1919 and 1920, 429 prizes; 140 firsts, 44 championships, and 14 grand championships. This is more prizes, more firsts, more championships, and more grand championships than were ever before won in two consecutive years by any one Berkshire herd in the world.

Young boars that are herd sire prospects of the kind that lift strains to the top, $200 each and up. Trios of six months old pigs carefully and properly mated—a real foundation—$300 to $2,500.

The services of our experts will start your herd "right"; and will save you years of time in achieving success in your breeding operations. Write us. You will like the way we help you!

Epochal Berkshires are the deepest and smoothest big-type hogs.

MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.

Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members.

The National Duroc-Jersey Record Association. Dept. 300 Peoria, Ill.

The Watertown Holstein Sales Co.
Holds Its
FALL SALE
November 23rd
at Watertown, Wis.

Sufficient cattle have been offered us this Fall to warrant a two-day sale as originally scheduled but in keeping with the policy that has governed us in the past we are sifting out the undesirables by means of a rigid inspection of all consignments. In consequence we will have just enough good ones left to make a splendid one-day sale on Nov. 23rd. We like to emphasize the fact that our directors inspect and when necessary reject. We feel as though it is one of the essential features of our semi-annual sales. And we know that it convinces our patrons that the Watertown Holstein Sales Co. aims primarily to satisfy.

And this is why
We do get by

Dispersal of Registered Holsteins

The Noted L. H. Field Herd, Osseo, Wis.

Friday, November 12, 1920

A rare opportunity for the man who wants Holsteins

A herd, Clean, Tuberculin Tested, that has never had anything but the best of care, where sires of Excellent Breeding have Always been used, and where Many Good Records Have Been Made, under the Best of Conditions.

Numbered among the Best Herds of Wisconsin.

Herd Sire—Milford Meadows Ormsby Oak De Kol No. 136425. A Son of Canary Homestead Oak De Kol, and from a 34.51-lb. dam.

Several Bull Calves that will just do some one a Lot of Good. Records all through their pedigrees.

Nine calves and short yearlings, from High Record Sires, and from Dams with Records from 21-lb. 3-yr.-olds to 29-lb. cows. This lot includes a Daughter of Sir Pietertje Ormsby Mercedes 42nd and from a 29-lb. dam. Also a Wonderful Heifer from a 23-lb. Jr. 3-yr.-old and Sired by the 42-lb. bull, King Bess Burke Ormsby.

Fifteen Senior Yearlings—Large, Growthy Ones, Nearly all from High A. R. O. dams. These heifers have all been bred to the Ormsby bull, Sir Ormsby Korndyke De Kol, who is Sired by a Grandson of Sir Pietertje Ormsby Mercedes and is from a 1,146-lb. 4-yr.-old Daughter of Sir Piet.

All of these Heifers are Sired by M. M. Ormsby Oak De Kol, the above Herd Sire, who is from a 34.51-lb. dam, and is sired by a son of Jessie Fobes Bessie Homestead, the 34.96-lb. 4-yr.-old.

Also, Mooie Johanna Creamelle, from a 30-lb. dam, next dam 39 lbs., and from a Son of Lady Reka Mooie, the Noted Show Cow who won Grand Champion at our State Fair Two Years in succession.

Nineteen Cows—All young—None over Seven Years Old. Mostly Three- and Four-year-olds.

Nearly All Have Good A. R. Records. Just one of the Best Chances You Ever Saw to Secure Some "Honest To Goodness" Cows That Are Worth Taking Home.
These Cows are Sired by such bulls as these—

Leland Korndyke Segis, whose first five dams on his dam's side have good year records.

Windsor Homestead Oak De Kol, from the Great Cow, Windsor Sweet Butter Maid. Milford Meadows Ormsby Oak De Kol, a 34-lb. Grandson of Jessie Fobes Bessie Homestead.

This lot includes a 3-yr.-old who made over 23 lbs. with first calf, whose dam has 30 lbs., next dam 39 lbs., and who is sired by a 34.50-lb. bull. She is on Yearly Test, and is making a very fine record. Will be announced at sale.

Come and see for yourself. You won't be sorry. Sale at the farm, Osseo, Wis.

Auctioneer: J. E. Mack

Sales Mgr., F. H. Everson, Lake Mills, Wis.

Waukesha County Holstein Breeders'

Conscripted Sale

Monday, Nov. 22

Bulls —

A 10-month-old son of Carnation King Sylvia, "the $106,000 bull", and out of a 34-lb. daughter of Sir Pietertje Ormsby Mercedes. She has three records over 30 lbs. and a milk record of 19,900 lbs., 805 lbs. butter in 295 days. A wonderful individual, combining the blood of the two greatest families in the world. **The First Opportunity to Buy This Combination.**

A 10-month-old son of 41st and out of Bonny Johanna Moore De Kol with 29.64 lbs. of butter in 7 days and 18,124 lbs. milk and 694 lbs. of butter in 305 days. Individually right. Good enough for any herd and bound to increase in value as he becomes older.

A number of other bulls, the best, from 30-lb. dams, near 30-lb. dams, or from 1,000-lb. dams. **You'll Be Surprised!**

20 other bulls from the greatest sires and from young cows with good records.

Females —

Several daughters of 30-lb. cows.

A number of choice cows with good records, one of them a young cow with twice over 27 lbs. now on test, and a sister to Wellington Vashti Korndyke, now making between 1,200 and 1,300 lbs. in a year.

A dispersion of 20 head of large frame, typy cows from the Duke Burnell herd, most of them bred to freshen this fall to Woodcroft Perfection, Wisconsin's first 40-lb. bull with a yearly record of 1,000-lbs. butter. These cows have never been developed. **Here's an Opportunity.**

Others all the way from 4 months to 7 years selected from the herds of **Waukesha's Largest and Most Reliable Breeders.**

Every animal comes from a **Tested Herd,** tested to ship anywhere and sold subject to a **60-Day Retest.**

The committee have conscripted the kind they would want for foundation stock. You buy them at your own price.

Iowa Holstein Breeders'
Second State Sale

At Des Moines — Nov. 16-17

A Sale of the Best the State Affords

Hand Picked—Tuberculin Tested—Guaranteed

The 85 Animals to be Sold Include 10 Splendid Young Bulls and 75 Females Good Enough for Foundation Stock in Any Herd.

Among the Entries—

King Pietertje Ormsby Piebe 22nd, a 5-month-old son of the famous K. P. O. P. and from Rose King of Cornella, a 1,000-lb. 4-year-old. A show calf backed by the best of long time records.

Eleven High Class Females from the herd of Hargrove & Arnold, 4 of them bred to K. P. O. P., and one to King Piebe, whose dam holds the world's record for 3-year records in heifer form. With one exception, all are two-year-olds or younger.

A son and a daughter of Oak De Kol Ollie Homestead from Iowana Farms, as well as 8 other young females representative of the best they have bred.

A 28-lb. cow and a 24-lb. cow both bred to an excellent year-record bull will be sold.

A show daughter of **K. K. S. V. 24th**, and 3 good heifers bred to Woodcrest Sir Clyde.

Seven cows bred to King Korndyke Pontiac Lass, the 44-lb. sire.

THE 75 FEMALES entered for this sale are all young cows and heifers — many are first calf heifers — due to freshen this fall or early winter. They are foundation females themselves and more — they are bred to the best bulls in the state — some of them sires of nation wide reputation. We planned this sale to serve the progressive breeder who wants females of this quality and with splendid individuality. You are included in that class. COME WHETHER YOU WANT TO BUY OR NOT.

Just About Ready for Service—$500

(Federal Accredited Herd)

is this bull we offer, and individually as good as his sire, Sir Walker Segis Homestead, first prize yearling bull at Chicago and Waterloo, 1919.

His dam just finished 305-day test with over 12,000 lbs. milk and 500 lbs. butter (2 milkings daily) as junior two-year-old and is a show heifer, first prize two-year-old and champion female at Minnesota's largest county fair and Holstein show (175 head).

Send for pedigree and photo.

A. J. Lashbrook, Northfield, Minn.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

6 Good Cows For Sale

THE MINNESOTA KIND

They are all by a 36-lb. sire, are bred to a son of King Korndyke Colantha Ormsby, and are due to freshen this fall and winter. They are from 3 to 5 years old and absolutely straight and right. Lack of barn room forces us to sell. Write or come and see them.

E. J. Brosious, - Stillwater, Minn.

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters. one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.

His dam has a record of 23.778 lbs. and now on yearly test.

Geo. H. Elwell, - Minneapolis, Minn.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams. For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

Grandsons of S. P. O. M. 41st and a Few Good Cows For Sale

M. L. Enright, East Grand Forks, Minn.

You Want

a bull calf from a healthy herd. You want him to be from a young dam that has not reached her maximum production. You want him sired by a high record bull with yearly record backing. If you get a splendid individual, to boot, you have no kick coming. We have just what you want. Come and get it or send for our bull list right now.

Flecks Farms - - Faribault, Minn.

Purebred Holstein Cattle For Profit

"Both milk and fat are produced at lowest rate in general by the cows consuming the MOST FOOD". This conclusion reached by Prof. H. H. Wing, Professor of dairy husbandry at Cornell, after a year's observation of the herd at the University experiment station. Holsteins are large and healthy, capable of converting large quantities of coarse feed into the best of milk suitable for all purposes, particularly in demand for infant feeding and for cheese making.

If you are keeping cows for profit, investigate Holsteins.

Send for Free Illustrated Booklets. They contain valuable information for any Dairyman.

The Holstein-Friesian Association
101 Hudson Street, Brattleboro, Vermont.

Missouri's Sensational Guaranty Sale of Pure-bred Holstein-Friesian Cattle

representing some of the richest blood lines of the breed

100 head of selected pure-bred Holstein-Friesian cattle taken from the well-known A. J. King herd of Grandview, Missouri.

Sale to be held at the Farm adjoining the little City of
Grandview, Mo., a suburb of Kansas City
Tuesday, November 9, 1920

Special Attractions of the Sale:

10 Daughters of King Segis Pontiac.

5 Daughters of Joe Calamo Hengerveld, the great show bull.

25 Heifers of good lines of breeding selected for this sale on account of their superior individuality.

All the above bred to the senior herd sire Imperial Rag Apple, whose dam was the world record heifer Albina Josie.

30 Cows either fresh or heavy springers, many with A. R. O. records.

20 Heifer calves, daughters of Imperial Rag Apple.

10 Young bulls of outstanding individuality by the senior herd sire. All ready for service.

Bear in Mind — Sale at the farm at Grandview a short drive out from Kansas City. Sale headquarters at the Dixon Hotel, Kansas City. All parties coming from a distance come to hotel where conveyance will be provided to farm. Come early. First auto bus will leave at 8 a. m.

All cattle tuberculin tested and sold with a 90-day retest privilege.

Write today for catalog to A. J. King, 12 East 9th St., Kansas City, Missouri.

W. H. Mott, Sales Manager, Herington, Kansas
A. J. KING, Owner, Kansas City, Mo.

This Son of King Pietertje Ormsby Piebe

is one of the best herd sire prospects ever offered at public sale. His dam, a 25.58-lb. 4-year-old, made 1,045 lbs. butter from 19,173 lbs. milk at the same age. His two nearest dams average 1,217 lbs. butter from 24,701 lbs. milk,—both of them as 4-year-olds.

King Pietertje Ormsby Piebe 22nd will suit you if you want individuality and long distance production.

He and 9 good females, most of them heavy in calf to K. P. O. P., will be sold in the **Iowa Breeders' Guaranty Sale Nov. 16-17** at Des Moines.

We will gladly send you further information.

Hargrove & Arnold Holstein Co., Norwalk, Ia.

Ormsby Bulls—

The 30-lb. — 1000-lb. Kind

If you want one of that kind — a real individual — write for our sale catalog.

We have left just a few sons of Sir Ormsby Skylark, the sire of Duchess Skylark Ormsby, from cows with 7-day records up to 40 lbs. and that have made or are making year records.

Have also a few splendid grandsons of S. P. O. M. from the same kind of dams.

25 Holstein Cows For Sale

or exchange. 23 are high grades, 2 are registered. Also my herd bull, a grandson of K. S. P. A., the $50,000 bull. This bull is from a 27-lb. cow. Most of the cows are bred to him. All are young cows, well marked, heavy producers. Price, $200 per head if entire herd is purchased.

Will take 2 good teams of draft mares or mules as part payment or might consider a good used automobile as partial payment.

G. A. HIGGINBOTHAM, Rossville, Kas.

New Wisconsin Champion

Makes her record with

PINE TREE MILKER

EVERY day brings new triumphs to the wonderful Pine Tree Milker. The latest is the grand record of Prospect Johanna Posch, a junior 4-year-old Holstein owned by W. F. Braatz, of Maple Grove Stock Farm, Brandon, Wis. In a 365-day test completed Oct. 20th, she made 23415.4 pounds of milk and 958.1 pounds of butter—bettering the old Wisconsin record by 1561.2 pounds of milk and 51.04 pounds of butter.

The New Champion was milked 4 times a day through her entire year's test with the Pine Tree. Mr. Braatz says—

"Pine Tree shares the honors with Prospect Johanna Posch, for I feel that I could never have made this record by hand milking."

We have always said "Judge it by What it Does." Let the records Pine Tree is making for others, guide you in choosing a milker for your own herd. It is the surest way.

Get all the facts from your Pine Tree dealer. Let him show you local installations. Catch the enthusiasm of your neighboring Pine Tree users. Also write today for the "Book of Experience" in which 43 practical dairymen tell you how Pine Tree has cut expenses and increased production.

W. F. BRAATZ
Maple Grove Stock Farm

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Topdressing Helps to Grow Good Pastures

To keep pastures in good condition the application of acid phosphate and ground limestone is recommended by soil fertility specialists at the Ohio Experiment Station.

Where farmers have fields difficult to plow, it is possible to stimulate the growth of bluegrass and clover by an application of acid phosphate and limestone. The use of these materials has proven beneficial on the experiment farm in Meigs County.

Grass seed applied early in February or March helps to establish a permanent pasture, but acid phosphate may be spread over the land in the fall at the rate of 200 to 300 pounds per acre every two years.

Ground limestone may be used every 4 to 6 years at the rate of 2 tons per acre.—Weekly Press Bulletin, Ohio Experiment Station.

New Junior Two-year-old Jersey Champion of Virginia

Mannsfield Doris Finance 385829, by producing 10,548.6 pounds milk, 584.48 pounds fat, Class AA, becomes the junior two-year-old champion of Virginia. She was started on test at two years and two months.

Her record exceeds by seven pounds fat the former title holder, Fern's Oxford Cocotte 393069, which produced 577 pounds fat.

Doris was sired by Double Finance 117794; her dam is Mannsfield Dorothy Perkins 329709, a cow with two Register of Merit records, in Class AA, that average 10,383 pounds milk, 562 pounds fat. Dorothy has also carried off many ribbons in the show ring, linking type with production. Mannsfield Doris Finance was owned, bred, and tested by R. Conroy Vance. —American Jersey Cattle Club.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The Holidays are Drawing Near

Bob always minds as quick as that!
When he is told to do a chore.
He has arithmetic down "pat";
And never litters up the floor.
It's "Yes, sir, dad", and "All right, maw".
Ah, what a pleasant little dear.
In his behavior, not one flaw!
The holidays are drawing near.

Wee Ethel, busy as a bee,
Seems strangely willing to abide
By all the rules that come to me,
Requests I make are not denied.
Her ribbons tied, her paddies clean,
The wash-rag rubbed from ear to ear.
It's "Dear old dad", and "Help you, maw?".
The holidays are drawing near.

In fact the wee ones and the grown,
Have changed an awful lot of late.
Such manners I have never known!
The bulk of work they do is great.
The wood is chopped—the cattle fed,
Their willingness is mighty queer.
"I'll help you, maw"—"Leave that to me!"
Ah! holidays are drawing near.

The Old Dairyman's Philosophy

Planting the seed of human kindness would be a lots easier if it wasn't for the fact there is so much land that needs cultivating.

Some cows have a lot more sense than some people, and there are times when I believe that all cows have more than most people.

There was a time when every time an artist drew a picture of a farmer he put a beard on his chin and a sprig of timothy between his teeth. Now they draw him driving a five-thousand-dollar car and looking like a banker.

"Milk cows need plenty of feed."

"Well, I've been givin' my prize Holstein so much of late that she hiccoughs so I can't milk her."

A New Profession

"What is Jeb doing these days?"

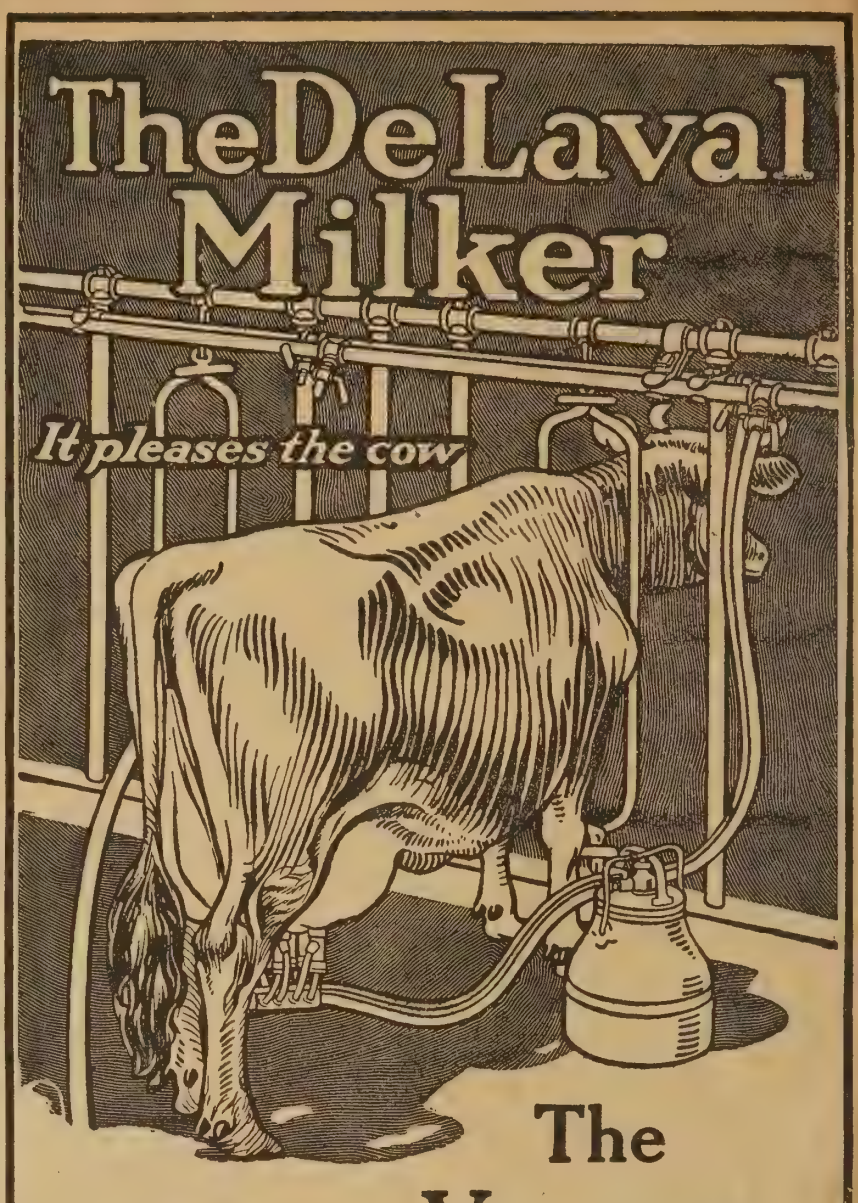
"Got the most important job on the farm."

"What's that?"

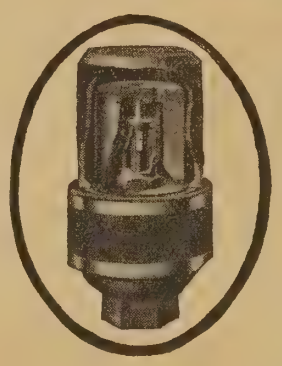
"He has to teach all the young calves how to walk and to eat dinner without gettin' milk on their shirt fronts."

The Little Lost Stream

Little lost stream of the summer time,
Born of the wood and the meadow way.
Where have you gone with your bubbling rhyme?
Where are the flowers of yesterday?
When it was June and the herd had gone,
Out to your brink, in a lazy line,
Sweet was your song at the early dawn,
Sparkling your depths as a jug o' wine.



Little lost stream of the violets,
Mirrowing cows as they stopped a while,
Eddying river that fumes and frets,
Bursts into song for another smile.
Now that it's winter I've lost your course,
Under the pall of the wide, white snow.
Friend of the cow and the plow-tired horse;
Where do you go, where do you go?



Little lost stream of the pasture land,
Winding along through the clover lanes.
Lovers have sung with you, hand in hand,
Yours is the realm of the golden grains.
Lost, in the mystery, still and bleak,
Buried away 'til another June.
Gone to the sea? Playing hide-and-seek?
Come, with your violets blooming—soon!

"The modern problem is overproduction, isn't it?"

"Yep. Most of the farm hands I know work too hard doing nothing."

The same fellow that refuses to donate anything to the good roads movement is the chap who spends most of his time pulling autos out of the mud and twenty-five dollars per pull.

The Vacuum Controller

(The Vacuum Controller is not shown in the part of the Milker installation pictured above. It is placed in a convenient place in the installation.)

The safety and success of a milking machine are largely dependent on the uniformity of the vacuum, and the De Laval Vacuum Controller is so constructed that correct and constant vacuum is maintained at all times.

The Vacuum Controller is scientifically designed for its purpose and fully covered by pending patents. No adjusting is necessary; the correctness of each Controller is determined and fixed at the factory and it cannot be adjusted, changed or tampered with.

The Vacuum Controller is entirely automatic and can be depended on to maintain a uniform vacuum in the system at all times. Experienced dairymen appreciate the importance of this strong De Laval feature.

The De Laval Milker has many other exclusive features distinct both in design and operation, which makes it positive and uniform in action from day to day; and faster, more economical and more reliable than any other method of milking. The sanitary features are of special importance and will be much appreciated by dairymen in their efforts to produce milk having the highest market value.

An additional insurance of lasting satisfaction to users of De Laval Milkers lies in the De Laval Company's well-known facilities and reputation for service.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

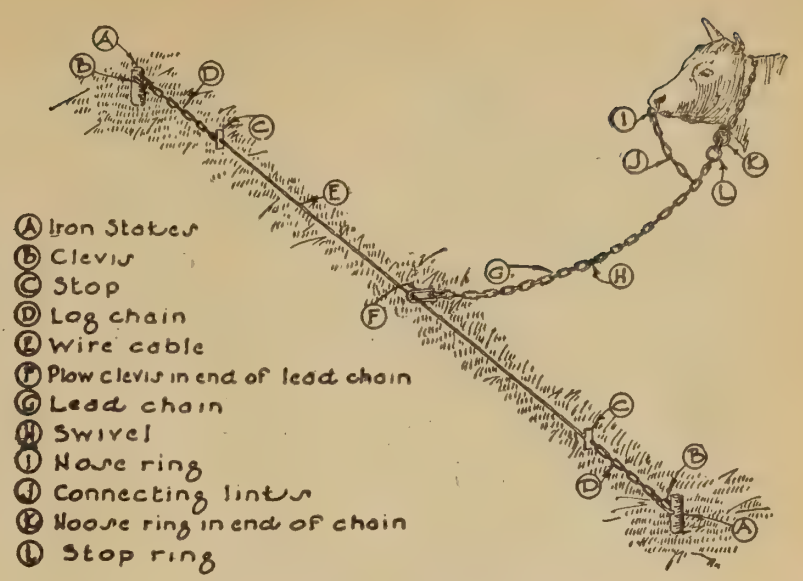
SAVING HIS NOSE

S. A. PEAVY, NEW YORK

CARING for the aged bull is always a difficult problem and it becomes doubly so during the summer months. We make no claim of solving this problem with entire satisfaction but, everything considered, we have found the method of tethering the most satisfactory under our conditions and for this purpose have found the following device very convenient.



A piece of wire cable, about like that used to stay telephone poles and thirty feet or more in length, is attached at either end to an iron stake in such a manner that the cable will be stretched out full length upon the ground. These stakes are made from rods an inch or more in diameter, are pointed at one end, flattened a little in the middle, and bored through the flattened portion for a small clevis. It is to this clevis that the end of the cable is attached. These stakes are driven firmly into the ground with a maul. To the cable is now attached the end of the bull's tie chain by means of a small plow clevis with a threaded bolt. The clevis is slipped over the cable and the bolt is run through the end link and then screwed firmly into place.

I wish here to recommend this method of handling as being quite safe and reasonably easy to manipulate. An aged bull should never be trusted with any kind of spring snap fastening. It is also imperative that such a bull be provided with a strong nose ring. There is no other practical or safe way to handle him and it is therefore almost a calamity when a valuable bull is ring-torn. In such cases the ring may be inserted vertically but the tissues then pierced are too weak to afford a safe hold for any length of time. I have known splendid bulls to be sacrificed because their noses had become torn. The weight of the tie chain, surging at his fastenings when frightened or angry, and careless handling such as pulling behind wagons, are common causes of torn noses.

Because of unfortunate experiences, and because it is quite out of the question to tether an aged bull at all unless he has a good nose, we set about devising a tie that would be likely to prevent any trouble from this source. With this in view we secured fifteen feet of welded twisted link chain considerably heavier than ordinary halter chain, and wired a heavy ring securely to one end. Through this ring the chain was "slipping noosed" around the bull's neck and drawn up comfortably snug. To the chain below this ring was then wired a larger ring to prevent the noose from opening up and slipping over the bull's head. The chain was then stretched straight ahead under the bull's jaw and attached vertically to the nose ring by three or four extra links. In surging at the tether or pulling behind a wagon the strain all comes on the noose about the neck which has a considerable restraining effect, although there is no danger whatever from choking. If the bull tries to run off straight away the nose attachment becomes effective at once —the more so because he is not much used to that check and his nose is not calloused to it.

This tie is completed by welding a strong swivel into the chain a few feet from the head and placing the plow clevis in the end as already described. When this is attached to the tether cable, it slides from end to end, affording the bull a liberal radius for grazing and exercise. A stop should be placed at each end of the cable far enough from the stake to prevent the bull from reaching and becoming tangled around it. For this purpose the end of the cable can be passed through an old plow point or similar piece of iron and connected with the stake by a log chain. The tether is easily moved one stake at a time and there is no chance for the bull to escape while it is being done.

We have used this device for the last three years and it has proven very satisfactory.

A SAFE DEVICE FOR TETHERING THE BULL

THE FARMER AND HIS HIRED MAN

MANY of the troubles between a farmer and his hired man arise because neither clearly understands his obligations to the other. Some of these obligations are matters of law, others simply of duty and fair dealing man to man. These relationships are discussed as follows in a bulletin on farm labor by H. C. Taylor, and J. D. Black, formerly with the Wisconsin College of Agriculture.

Matters of Law

1. When one man hires out to another, the employer is boss, that is, he has the right to direct the work which he hires done. The workman sells this control over his activity when he sells his labor. The employer is also usually the owner of the property with which the employee works, and both law and custom give to the owner of property almost exclusive control over it.

2. No employee can be made to work for any employer a minute longer than he wants to, that is, "specific performance of a labor contract cannot be enforced." It makes no difference whether the laborer has agreed to work an hour, a day, or a year, if he wants to stop working, there is no power in a free country, except perhaps in war-time, which can make him work.

3. The laborer is entitled to full pay for all the time he works and can collect it in the courts, if necessary. If a laborer hires out for six months and is discharged or quits of his own free will in two months, he can draw two months' pay. Not all farm employers understand this and every little while some one tries to hold back some part of a hired man's wages and then refuses to pay it if he quits.

There are often, of course, some difficulties in the way of collecting full pay in the courts; for example, in many cases a man is discharged because he does not prove to be what he reported himself when the bargain was made. In such a case the court has to decide what the man actually earned and award him wages accordingly.

It will be evident that it is very foolish for either party to go to court to settle a matter of this kind. The sensible plan is for the farmer to discharge a man if he does not come up to his claims and promises, unless the man will make a new bargain, but to pay him the full amount for as long as he works under the terms of the bargain.

4. A laborer is liable for all the injury he does by quitting a job before his time is out. If a man hires out for a season and quits in the middle of haying and part of the crop is spoiled as a result, he can be sued for damages, unless he can prove sufficient cause for his quitting. Unfortunately, however, such a suit would ordinarily be useless, because a judgment against a hired man ordinarily has little value. It is also hard to prove that the employer himself has not violated the contract in some particular.

5. An employer cannot be made to employ a laborer longer than he wishes, but he is liable to an employee for all the damage he does by discharging him before his time is out. This damage, of course, cannot exceed the amount of the hire. This damage can usually be collected because the employer generally has property, and a laborer's claim is one of the first to be satisfied in case of foreclosure.

It would thus seem that normally employer and employee are on an equal footing. Neither can be forced to carry out the terms of a labor contract; the employer gets the services and the laborer gets his wages up to the time the contract is broken, and each is liable for all the damage he causes to the other. The employer is boss, but the employee does not have to work a day if he does not have fair treatment. He cannot

Granddaughter of Sophie 19th Produces 815 Lbs. Fat

SOPHIE'S DEBORAH

AT the age of two years and eight months Sophie's Deborah made her first appearance in the Register of Merit. Her record just completed is her third consecutive record. This test was begun at the age of five years and two months and she produced 14,310.6 pounds milk, 815 pounds fat. Her first record is 608.01 pounds fat in 10,361.7 pounds milk, and the second, at 4 years, is 787.59 pounds fat in 13,601.5 pounds milk.

The sire of Sophie's Deborah, Pogis 99th of Hood Farm, is one of the four bulls having the distinction of winning both gold and silver medals for ability to transmit extreme production to their offspring. He has 65 daughters and three sons in the Register of Merit.

The dam of Sophie's Deborah is Lass 66th of Hood Farm, champion three-year-old of the breed. Lass 66th has three official Register of Merit tests that average 15,000 pounds milk, 746 pounds fat.—AMERICAN JERSEY CATTLE CLUB.

EVERY GROWER RECEIVES THE SAME PRICE

How Crops Are Pooled in Co-operative Marketing Associations in California

HERMAN STEEN, ILLINOIS

EVERY co-operative marketing organization in California has for one of its fundamental features the plan of pooling the crops it handles. Under the pooling system, each kind and quality of product is kept separate, and the returns from the sale of the crop are divided among those who produced it. In other words, every farmer receives the same price as every other farmer for an equal quality of product.

For example, the California Prune and Apricot Growers, Inc., will handle around 250,000,000 pounds of prunes of the 1920 crop. These are divided into grades by sizes—those running from 20 to 30 to the pound are one grade, the 30 to 40's another grade, and so on up to the 90—100 size, in which grade the smallest prunes fall.

Farmers Get a Receipt

When the farmers bring in their prunes, the fruit is graded and sorted into sizes. Second-class fruit is kept separate from the first-class, and the various sizes are all packed separately. Each farmer's fruit is lost in the shuffle; all that Farmer Jones has is a receipt giving him credit for so many pounds of 20—30's, so many of 30—40's, and so on.

Let us consider the 20—30 size alone. Suppose there are 5,000,000 pounds of them in all. The association fixes a price of 25 cents per pound on this size, which is a luxury grade of prunes and much higher than any other grade. One million pounds sell at 25 cents per pound. The demand is usually strong, so the association raises the price to 28 cents per pound and sells another 1,000,000 pounds at that price. The heavy demand continues, so the price goes to 30 cents, and 1,000,000 pounds are disposed of at that price. Business slows up, perhaps, so the price of 20—30's falls to 27 cents, at which price the fourth 1,000,000 pounds go on the market. The remaining 1,000,000 pounds does not find a ready sale, and is finally disposed of at 22 cents late in the season.

Dividing the Proceeds

The association bookkeeper counts up his cash, and finds that the 5,000,000 pounds brought in a gross total of $1,320,000. Perhaps one wholesaler in Detroit went broke and left the association holding the sack to the tune of $20,000. That is subtracted.

The average cost of selling prunes this year, including agents, advertising, overhead, and everything, is two per cent, let us say. So two per cent is deducted from the $1,300,000, and the rest is ready to be paid to the growers. It leaves $1,274,000 to be divided. That figures out exactly 25.48 cents per pound for all the 5,000,000 pounds of prunes in the 20-30 pool this year.

Advancing Money to Growers

Now actually the growers were paid an advance of 15 cents per pound on all 20—30 prunes in September, when they delivered the crop to the association. The association borrowed the $750,000 necessary to pay this advance, giving its note at the bank. Suppose the first batch of 1,000,000 pounds of prunes was sold in October at 25 cents. The association immediately receives $250,000. That much of the loan is repaid. In November the second 1,000,000 pounds is sold at 28 cents and $280,000 comes into the treasury. Another slice of the note is taken up.

In December the 30 cent sale is made and $300,000 comes in. The rest of the note is taken up, and $80,000 is left in the treasury. There is not enough to divide at this time, and anyway there is interest to pay and general expenses to meet. The $80,000 is retained for the time being, though it belongs to the growers and will eventually be paid to them.

Dividing the Pool

In January the 1,000,000 pounds are sold at 27 cents, making the total amount in the treasury of the 20—30 pool $350,000 less the expense of selling. The directors on February 1 decide to pay five cents per pound on this pool, and the growers are soon in possession of checks. Then the last 1,000,000 pounds are sold bringing in $220,000 more. A few collections are slow, and the exact amount of the expense cannot be calculated until the end of the season, so it is necessary to keep a little on the safe side. A further payment of five cents is made on April 1, the growers by that time receiving a total of 25 cents per pound.

It takes time to wind up the business of the year, so it is August 1 before the 20—30 pool is ready to be finally closed. The books then show that a final payment of 48 cents per 100 pounds can be made, so the directors authorize the payment and closing of the pool. The money received for 20—30 prunes has all been paid to the growers, less only the expense of selling the crop.

How it Works

Farmer Jones had 5,000 pounds of 20—30 prunes, while Farmer Smith had 10,000 pounds. These prunes were delivered along in the fall, each man being paid 15 cents per pound at the time of delivery. On February 1, both Jones and Smith received five cents per pound. On April 1, they received another five cents per pound. On August 1, they received 48 cents per 100 pounds each.

Now Jones' and Smiths' prunes went into the packing house, and were packed along with thousands of pounds more prunes of the 20—30 size. They soon lost their identity and nobody could tell any of them from the others in that bin, because they were all of the same grade. Supposing, however, that the prunes Jones grew (they are no longer his, because the association obtained title to them when they were delivered) sold for 30 cents per pound finally, while the ones Smith grew brought only 22 cents per pound. Each man, however, is paid the same, as it was not Smith's fault that his prunes brought only 22 cents, and it was not to Jones' credit that his brought 30.

Our readers will understand, of course, that this is an imaginary case—that the actual handling of the pool is considerably more complicated than this example shows. This story illustrates exactly the method of operation and brings out clearly the general method of operating the pool. In practice, the fluctuation in prices would be much less—it is probable that it would not vary one cent per pound during the whole year.

A RAISIN-DRYING SCENE IN THE SAN JOAQUIN VALLEY

Used by Every Association

The pooling plan is used in every co-operative marketing association in California. The method of operation varies considerably in different associations. The prune and apricot, dried peach, almond, and raisin associations, as well as several others, employ the year-around pool. That is, there is only one general pool for each crop, and that pool is kept open until all of that crop is sold.

The egg-selling associations at Los Angeles and San Francisco, however, have a new pool each week. For example, the eggs of the week of October 17-23 are sold together and the proceeds divided. The eggs received by the association the week of October 24-30 make up another pool and so on.

The citrus growers have several kinds of pools, these varying to suit the local associations, which comprise the California Fruit Growers' Exchange. One local has one pool, which closes November 30. All oranges delivered between the beginning of the season and November 30 are in the early pool. This is sold separately from the pool which begins December 1 and includes all the rest of the season's crops. Some orange associations form a new pool every month, others have only one for the year. Nearly all of them operate a "Frost pool", which includes all fruit that has been frosted.

Pooling is Necessary

Managers and officers of the co-operative associations in California were united in saying that the pool is a necessary part of the machinery of their organizations. "Producers should never be competing against each other in the sale of their crops," said one leading co-operator. "Every man should receive for his No. 1 product the same price per pound as every other man in the association. The pool idea is absolutely fair, it is just, and it keeps one man from having an advantage over any other man within the marketing association."

The pooling idea has been used to some extent by farmers' marketing agencies in this part of the country. The most conspicuous example is the wool pools of the Central States which this year include 20,000,000 pounds or more of wool. This wool is all graded and sold by grade, every man getting the same price per pound for one grade of wool.

Used by Milk Producers

Several of the co-operative milk marketing agencies use the pooling plan. For example, the Twin City Milk Producers' Association of Minnesota usually sells the bulk of its milk to distributing companies in Minneapolis and St. Paul, and makes the rest up into cheese. The milk made into cheese may yield $1 per 100 pounds less than that sold as whole milk, but the proceeds from the sale of milk are divided equally among all milk producers. It makes no difference to a member of that association whether his milk goes into cheese or into quart bottles for city delivery. He gets the same price either way.

The Michigan Potato Growers' Exchange is another marketing association which employs the pooling plan. A daily pool has been devised, so that the returns on all potatoes of a given grade sold on one day are averaged up, and each grower receives the same price per bushel.

The pooling system is not as complicated as it sounds. As far as I could learn, it is one of the easiest parts of the co-operative system in California to operate, and, instead of being a source of trouble, it seems to be one of the best safeguards against trouble.—Copyright, 1920, by Standard Farm Papers, Inc.

In certain sections of the country the practice of "stuffing" a barrel, a box, or a bag with under-size and over-ripe specimens of fruits and vegetables is common. But no longer does this fool any one, say marketing experts of the Bureau of Markets, United States Department of Agriculture, for the buyers give slight consideration to the top of packages offered by these growers.

Uncle Sam's Hired Men Who Serve You

Colonel W. B. Greeley, the Government's Chief Forester Wants to Make the Nation's Forests Serve You Better

JOHN ANSON FORD

This is the eighth of a series of articles this publication is running, in co-operation with the United States Department of Agriculture, to acquaint our readers with the type of men who are making possible the wonderful service the department is rendering and stands ready to render our readers, that those not now availing themselves of these services may do so.—EDITOR.

THE call of the wild and the influence of three men, two former Forest Service chiefs and a much beloved old uncle—these were the factors which started William B. Greeley on a path that has led to noteworthy national service and only recently has brought him, at the age of 41, to the position of chief of the Forest Service, one of the seventeen branches of the United States Department of Agriculture.

Greeley is a combination of the West and the East. Both sections of the country have shared in shaping him. He was born in Oswego, N. Y., and at the age of eleven moved with his parents to California. After seven years spent on a ranch in Santa Clara County, Greeley entered the University of California, where he remained for four years.

But in a very direct way the East influenced young Greeley. Back in Pennsylvania was an old uncle, William Buckhout, a close friend of early leaders in forest conservation in that state. Upon his advice, Greeley, after a year of teaching in Alameda (California) High School to replenish his bank account, entered Yale for two years of intensive technical study, in which he showed exceptional capacity and promise of leadership. While Greeley gives much credit to his old uncle for starting him in his profession, he also acknowledges a debt to Gifford Pinchot, then at the head of the government's fast-growing forestry work, who early recognized his worth and encouraged his ambition for a life of valuable public service in this relatively new field.

In 1904 Greeley's connection with the Forest Service began. Little more than a year later he took charge of the Sierra National Forest in Southern California. On foot and on horseback he explored mountains and valleys, ascertaining the areas and boundaries of forested regions, locating streams and lakes, helping lay out new trails, sleeping at night in a settler's cabin or under the stars.

In the spring of 1908 Greeley was called to Washington to become assistant chief of the division of management, a task which put him directly in touch with much of the executive work of the organization. Less than a year later came another promotion through appointment as District Forester for District 1, with headquarters at Missoula, Mont. The administration today of the 29,000,000 acres of National Forests in Montana and Northern Idaho, which were under his supervision, still bear the impress of his organizing ability and wise management. In directing the fight on the great forest fires in District 1, which caused much damage in 1910, he did especially efficient work.

Appointed Assistant Forester

In 1911 Greeley was again called to Washington, this time to become assistant forester in charge of the branch of silviculture, which, through the district foresters, has supervision of the timber sales, timber and fire trespass cases, reforestation, and cooperative work with states and private owners in promoting fire protection. To this important assignment was shortly added oversight of the scientific investigations of the Forest Service, designed to secure new knowledge necessary for the better

WM. B. GREELEY

practice of forestry and better use of forest products.

There were still bigger experiences in store for the forester. Not long after the United States entered the great war, an urgent call came for forestry troops and the Forest Service was asked to recruit the needed men. It fell to Greeley to take charge of this. He was later sent to France where he eventually became chief of the forestry section in the American Expeditionary Forces, in charge of 21,000 forestry troops and 95 sawmills, succeeding Henry S. Graves, who returned to the United States af-

TOM'S NEW SUIT

DOROTHEA McDOWELL

"HOW do you like my new suit?" asked Tom Jenkins, as he met his old friend, Dr. Hudson, in the lobby of the best hotel in town.

"It looks very well," replied the doctor who, in his younger days, had worked a year or two in a first-class clothing store in Chicago and who had continued to keep posted on quality in cloth. "It looks very well, but I wouldn't like to guarantee that it will wear well."

"It ought to wear well," replied Tom, "I paid $50 for it."

"You paid too darned much," answered the old doctor as he examined the cloth more closely.

"Why, isn't it all wool?" asked Tom. "They guaranteed it to be all wool."

"Yes, it's all wool, all right, but it's also all shoddy," replied the doctor.

"Shoddy!" exclaimed Tom. "What do you mean by shoddy?"

"Why, I thought everybody knew the meaning of shoddy," answered the doctor. "Well, I'll explain. Briefly, a shoddy suit of clothes is one that is made, at least in part, of old rags. The ragman gathers up old rags, clean rags, filthy rags, all kinds of rags, at a few cents a pound and sells them to a dealer. The dealer sells them to a manufacturer. The manufacturer grinds them up, adds a little new wool to give strength to the fiber, and after a few more processes, cloth that looks as good as new is manufactured from a lot of old rags and a little wool. If the cloth is made of woolen rags it may be all wool but it hasn't the strength, it won't keep its shape, and it won't wear like cloth that is made of new wool. Besides, who likes to think that his new suit has already been worn by others?"

For a few moments Tom seemed lost in thought, then he asked: "Do you really think that the material in this suit has been worn by other people?"

"I don't think it," replied the doctor, "I know it."

The doctor had quite an imagination, and Tom listened with close attention as the doctor continued.

"In imagination, I see a part of your new suit on a sheep's back in 1912. In 1913 that pure white wool was mixed with other good wool, woven into cloth, and the cloth was made into a fine, new, and fashionable suit of clothes for a college president. You know, in those days college presidents and even college professors could afford good clothes.

After the college president had worn the suit for a year, it was getting a little shabby and his wife put it into a missionary box and sent it to a missionary in Kansas. The missionary wore the suit as long as it looked at all respectable, then it was sold to a colored man at a rummage sale."

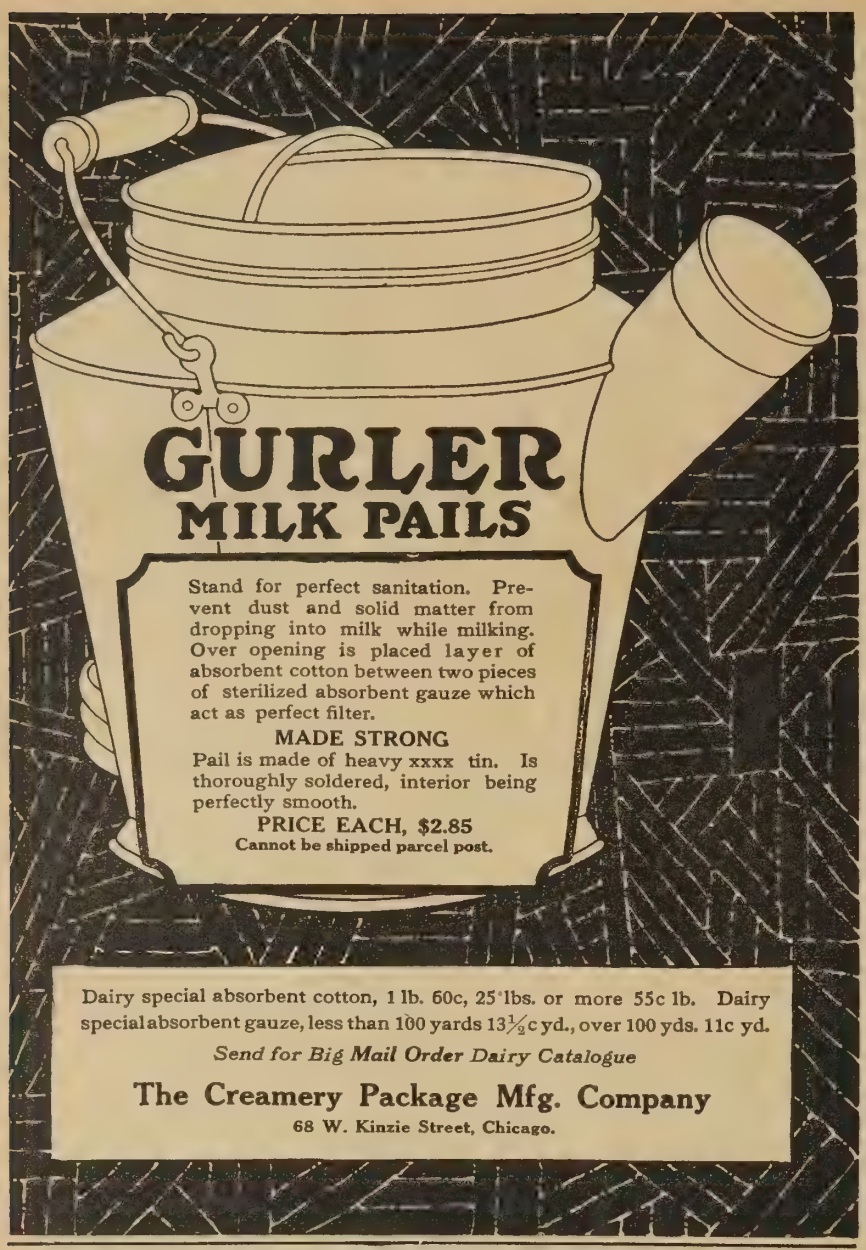
"What," exclaimed Tom, "you don't mean to say that the material in my suit was once worn by a colored man?"

"I don't know, of course," answered the doctor. "It probably was, but you needn't look so sour about it."

"But," said Tom, "I can't get over the idea that my new suit may once have been worn by a colored man."

"Oh! Cheer up, the worst is yet to

(Continued on page 767)



Three Guernsey cows which have lately completed high records. From left to right they are:

Brita of Beaver Ridge, bred by Beaver Ridge Farm, New York, and recently purchased by R. M. Lewis, Connecticut. She has completed a record of 9,710.7 pounds of milk, 548.48 pounds fat, in class FF, carrying a calf 275 days of her testing period. She thereby qualified for fifth place in the 2½-year-old division. She is large and well matured, has a fine yellow skin, good udder, and has great depth of body. In addition to making an exceedingly creditable record, she has dropped a beautiful heifer calf, and has increased in weight by over 300 pounds in one year.

Pearl of Pomeroy, owned by D. D. Tenney, Shorewood Farm, Minnesota. She has completed her third Advanced Register record of 15,804.5 pounds of milk, 777.16 pounds fat. She carried a calf 273 days of her testing period. Her initial record of 12,114.7 pounds of milk, 618.65 pounds fat was made in the senior three-year-old division. As a five-year-old she came back with 11,798.9 pounds of milk and 583.67 pounds of butterfat and carried twin calves 275 days of her testing period. Her total production in the three lactation periods is 39,718.1 pounds of milk and 1,979.48 pounds of butterfat, an average of 13,239.4 pounds of milk and 659.83 pounds of butterfat.

Ultra Celia, owned by Jules Breuchaud, New York. She now heads the list in class G of the Advanced Register with a record of 12,566.2 pounds of milk, 755.83 pounds fat. This production exceeds the record held by Langwater Phyllis, the previous leader in class G by 9.6 pounds fat, but falls short by more than 700 pounds of equalling the milk record made by the previous champion. Ultra Celia was bred by Burnside Farm, Maryland, and was dropped on February 20, 1917. Mr. Breuchaud purchased her for $3,500 at the second combination sale of Guernseys. The new champion comes from a long line of famous ancestry. She was sired by Ne Plus Ultra whose daughters have made exceptional production records, and at both private and public sales have commanded record prices. Her dam is Queen Celia, a cow that was sold at the first combination sale for $5,000.

"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings top prices —pleasing the eye and tempting the palate.

The High Scores of 1920

In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor.
Doesn't color the buttermilk. Leaves no sediment.
Colors more butter to the gallon.

Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all Food laws—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc. BURLINGTON, VERMONT

Washington, D. C., Weekly News

[Special to Hoard's Dairyman]

Washington, October 28.—B. H. Rawl, chief of the Dairy Division, has taken prompt steps since his return from the National Dairy Show to make preliminary inquiries of the State Department as to the formalities to be observed in sounding out foreign sentiment as to the project for holding the International Dairy Congress in this country in 1922. Prospects seem very favorable, but the preliminary work includes the action of Congress which must still be secured. The preliminary announcement issued by Dean VanNorman, president of the National Dairy Show, and summarizing the preliminary action taken at Chicago, was received by interested officials here this week and has made a very favorable impression.

⚜

"Eat More Cheese" bids fair to be as forceful and as necessary a slogan as the "Buy a bale of cotton", in the troublesome days of 1915 and '16. With condenseries closing in the big milk producing districts, the re-opening of cheese factories has become absolutely essential, and reports reaching the Dairy Division indicate that hundreds of factories have started up in New York, Ohio, Illinois, Wisconsin, and elsewhere. Cheese is a product which lends itself to parcels post delivery within the first three or four zones, without sufficient increase in cost to wipe out the difference between the prices the actual co-operative producers are willing to sell for and present executive retail prices which include, as is necessary, store and delivery costs. Numerous factories in Western New York are advertising wholesale prices on parcels post deliveries, and the idea seems to bid fair to make a hit. Small cheese bought this way and shared between two to four families is a welcome and inexpensive article of valuable food.

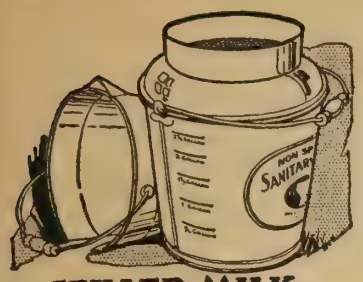
⚜

The reorganization of the Maryland—Virginia Milk Producers' Federation was perfected at the annual meeting held in this city recently. By-laws of the new association were adopted, after it was announced by T. E. McLaughlin, the manager, that the incorporation papers had been filed and the organization perfected. Officers chosen include: President, Dallas Berry, Virginia; vice-president, J. B. Thompson, Maryland; treasurer, Y. E. Booker, Washington, D. C.; secretary and manager, T. E. McLaughlin, Maryland. Practically the entire milk supply of the capital now comes from the members of this association, and the bulk of the supply is sold on the basis of 44 cents per gallon for 3.5% milk, delivered in Washington.

Some trouble exists between the association and one or two dealers who are buying at country plants, and who refuse to pay the association price. These dealers are endeavoring to secure a supply in New York State, where there are three sections with fair direct rail communications into Washington, namely around Elmira, around Olean, and in the extreme west end of the state. Opposing this is the requirement of the District of Columbia health officials that all milk sold in Washington must come from tuberculosis-free herds. Legal action is threatened to restrain Health Officer Fowler from enforcing this rule.

⚜

Manager Warber, of the National Milk Producers' Federation, is back from a western trip which included a stay at the Dairy Show, and is busy getting out the reports of the Chicago convention of the Milk Producers' Federation. He has issued a statement of the resolutions adopted there, and the text of the strong address on general dairy conditions made by President Campbell. Mr. Warber is making an analysis of the points of similarity and dissimilarity of the various individual producers' organizations affiliated with the Federation, of whose work detailed reports were made at Chicago. This bids fair to be a most interesting study, and will undoubtedly be used as the basis of the drive for new organizations which is planned, and for which a special committee is to hold an early meeting in Detroit to make plans. A general and comprehensive study is also being made of the condensery situation, and the actual effect the recent closing of many plants has had on the fluid milk situation. The results of this study are greatly needed just at this time.



CARNATION KING DE KOL GOES TO SOUTH AMERICA

This son of Carnation King Sylvia was recently sold to Julio F. Genoud, Buenos Aires, Argentine. Carnation Stock Farms have also recently sold a son of Avon Pontiac Echo to M. Z. Arteta, Quito, Ecuador, thus placing one sire on the Atlantic coast of South America and one on the Pacific coast.

Bran Still Too High

HOARD'S DAIRYMAN:—Bran and shorts are still above a parity with other feedstuffs. Dairymen, who consume the bulk of the bran produced in the country, and hog producers, the principal buyers of brown and gray shorts, are hesitant because of the price disparity to accumulate their fall and winter needs of the wheat offal feed. Bran at $29 a ton and shorts at $32 a ton on the same market where corn is selling around $27 to $28 a ton, and for the same

SPILLED MILK IS MONEY LOST

The Non-Spill Sanitary Dairy Pail is safe. When it is knocked over, the seal valve closes the opening and stops the milk waste. A closely woven brass sieve strains the milk as it goes into the pail and keeps out the dirt. The milk stays clean.

The pail is sanitary and easy to wash. All inside seams and rivets are soldered smooth. There are no crevices in which dust or contaminating substances can collect. Every part can be taken out, cleaned and scalded. This pail carries out the splendid sanitary principles of the United States Food Administration.

These sanitary safeguards may mean the difference between health and sickness to your family. If you sell milk, these purity features of the Non-Spill Sanitary Dairy Pail mean dollars in your pocket.

Your local dealer sells it or will get it for you. It's a Schlueter metal product.

Dealers: Write for our special proposition. Your customers will want Non-Spill Sanitary Dairy Pails.

shipment, reflect an abnormal condition which tends to discourage consumers of mill feed from accumulating stocks. Seldom in market annals have bran and shorts sold above corn, pound for pound, at least not in recent years. And bran and shorts are selling too high compared with many other feeds, including cottonseed cake and meal, alfalfa hay, and mixed feeds.

In view of the relative position of prices, any sharp upturns in bran and shorts are improbable, yet the supply situation does not warrant any bearishness over the market outlook. Flour mills of the United States are operating at less than half capacity. Flour trade has been far below normal thus far on the crop, and the prospects are not particularly encouraging for any sharp improvement. Observers of the flour situation, in fact, do not anticipate an extended period of full capacity operations by mills of the country, due largely to the exceedingly light sales being made for foreign shipment. There is sufficient demand for bran and shorts in the country to absorb much of the output of mills in mixed cars with flour, and such trade has been stimulated by the fact that buyers, lacking credit, show a preference for the mixed cars which involve considerable less capital than straight cars of flour and feed. The liberal percentage of mixed car business tends to reduce the available supply of mill feed on markets.

Another influence which demands attention from the standpoint of supplies is the small amount of feed which has gone into storage the past month or two months. Normally during the summer months and in the early fall season, when pastures provide a bountiful source of feed and demand for bran and shorts is at its low ebb, jobbers and other speculative operators store large quantities to take care of the enlarged demand for winter and spring, in which seasons mill production is usually below normal. Because of the extremely erratic action of prices, the uncertainty of trade generally, and the inability of operators to finance large purchases to hold in store, only an insignificant amount of mill feed has been accumulated. Markets will doubtless feel the effect of the absence of such feed from the consuming channels of the country, but there is a possibility that any scarcity will be made up by the abundance of other feeds, thus tending to check bullishness in prices.

In many sections of the country comparatively high prices for bran will cause dairymen to substitute other feeds which are on a cheaper basis. As a whole, however, this cannot be practiced except in a small way; at least, it has not thus far been demonstrated on markets. There are a great many feeders who will buy the offal irrespective of its price, as was the case when values were around $60 a ton in the spring months this year. Demand, it seems, was keener at that time than on the present market.

Missouri. SANDERS SOSLAND.

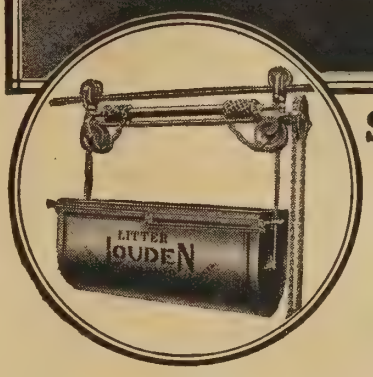
To Dr. S. M. Babcock on His 77th Birthday

Not selfishness has ruled your life, philosopher and sage,
Not gain and luxury of wealth, have been your aim and wage;
But service rich, of head and heart, in love for all mankind.
You've freely, fully, gladly given, with never self in mind.

Such service has its sure reward, unlooked for though it be,
Not told in titles, 'graved on stone or paid in golden fee;
In your own heart there is the joy of noble work well done.
And in the heart of all the world, deathless esteem you've won.

Wisconsin. A. S. ALEXANDER.

LOUDEN
Modern Barn Equipment



Wm. Louden
whose Labor Saving Barn Equipment is used in over a million barns.

The Old Way

Louden Litter Carrier
does away with back-straining wheelbarrow — carries manure from barn to pit or spreader—saves one handling. Biggest labor saver on any farm. A boy operates it easily and safely.

Louden 224-Page Catalog
— sent prepaid — shows Louden Stalls and Stanchions, Litter and Feed Carriers, Water Bowls, Animal Pens, Hay Unloading Tools, Power Hoists, Barn and Garage Door Hangers, Cupolas, Ventilators—*"Everything for the Barn."*

Write Us about your barn building plans. Our experts will help you. *Get the Louden Barn Plan Book,* a complete 112-page encyclopedia on barn building. Sent on request.

Saves Half the Barn Work Every Day

DOES for the barn what machinery does for the field — releases man power — makes it possible for one man to do the work of several—helps solve farm hand scarcity.

Handling cows morning and evening, feeding and watering them, cleaning the barn, are jobs done with half the help when your barn is equipped with Louden Steel Stalls and Stanchions, Litter and Feed Carriers, Automatic Water Bowls. You will find your barn more convenient—kept neater and that your cows show a big increase in milk yield because of better health, greater comfort and regular watering. Easily installed at moderate cost in any barn.

$850 to Missouri Juniors

Eight hundred and fifty dollars in cash prizes and trophies will be awarded to the successful competitors in the Junior Live Stock Judging Contest to be held at Columbia, Mo., on November 12. The Kansas City Weekly Star offers a trophy cup valued at $250 to the winning team on all classes. The Journal of Agriculture offers a beautiful trophy cup to the individual making the highest total score. The Kansas City Chamber of Commerce will give a cup to the individual making the best score on all classes besides $50 in cash to be distributed among the first seven on all classes. The Doty Publishing Company has given a trophy cup to the team making the highest score in swine judging. In addition to the trophies offered above the American Shorthorn Cattle Breeders' Association offers $75 to be distributed in cash prizes; the American Hereford Cattle Breeders' Association, $75; the Missouri Live Stock Producers' Association, $50; the Horse Association of America, $75; Missouri Dairy Council, $65; and the Leitch Sheep Co., $10.

The contest will be held at the College of Agriculture, University of Missouri. It will be open to teams of three from the agricultural high schools and boys' and girls' clubs of the state. At the present there are some seventy-three vocational agricultural high schools in operation in which nearly 2,000 of the future farmers and live stock men of this state are receiving instruction in agriculture. It is expected that the majority of these schools will be represented in the contest and, judging by the interest shown and the preparations being made, competition will be very keen on November 12.

Ten classes of live stock will be judged, two of beef cattle, two of hogs, two of sheep, two of dairy cattle, one of draft horses, and one of mules. The boys will be allowed fifteen minutes to place each class and two minutes in which to give oral reasons on this class.

The object in this contest is to stimulate interest in live stock production and to afford practical experience in judging. The winning team in this contest at Columbia will be designated to represent the state of Missouri in the International Junior Live Stock Judging Contest to be held in Chicago on November 26.

Missouri. R. E. MILLER.

Texas Cows to Germany

HOARD'S DAIRYMAN:—Arrangements have been made for exporting of 35,000 head of Texas cows to Germany for the purpose of rehabilitating the depleted dairy herds of that country. The shipment of this lot of cows may be followed by other large purchases and shipments it is stated. The work of buying these cattle and their exportation is in the hands of Dr. August Mueller of Berlin, representing the German Government. The matter was taken up with the United States Bureau of Animal Industry and the necessary permission for the exportation of the animals was obtained. It is stated that all cattle will be dipped according to federal regulations and that in this and other respects the requirements of the government will be complied with. The cows will be gathered from the farms and ranches of the state; no effort will be made to purchase only blooded animals as it is necessary that the animals be assembled and exported as quickly as possible. Mr. Mueller is now in Texas looking after the matters connected with the transaction. The inspection of the cows will be under the direction of Dr. C. E. Palmer, inspector for the Bureau of Animal Industry, with headquarters in Houston.

Texas. WM. D. HORNADAY.

More Income This Winter

will be the result where stock is properly protected by thorough sanitation before the indoor season begins. With your herd and flock thus guarded there will not be the considerable death losses to charge to expense, or so many disease-infected, louse-covered, mite-ridden weaklings to feed. This and the all-around improvement in production from comfortable animals will mean a higher excess of income over outgo for the year.

CARBOLA
The Disinfecting White Paint

prevents contagious disease germs, lice, mites, etc., from ravaging your stock. A white paint in powder form, combined with a disinfectant many times stronger than pure carbolic acid, Carbola paints sunshine into dark corners and makes every surface, crack and crevice proof against lodgment and growth of the germs of roup, white diarrhoea, cholera, glanders, contagious abortion, etc., and kills lice, mites, and fly-eggs, permitting stock to be healthier, more comfortable and more productive.

Carbola makes it easier to do work that must be done. Being both paint and disinfectant, it saves one operation entirely. It is mixed with water and ready to use in less than five minutes—no straining or waiting—much quicker than whitewash. Flows smoothly—does not clog the sprayer—saving more time. Does not spoil if left standing. Does not peel or flake. Retains its germicidal strength on the wall. Non-poisonous and non-caustic—will not harm the smallest chick or stock that licks a painted surface.

Use Carbola Instead of Whitewash and Disinfectants

In stables, hog pens, poultry houses, creameries, kennels, out-buildings, cellars, garages, etc. Apply it with brush or sprayer to wood, stone, brick, cement or other surfaces, or over whitewash. A gallon (a pound of the powder) covers 200 square feet. Used and endorsed by thousands of farms, large and small, and by leading agricultural colleges and experiment stations.

Your hardware, paint, drug, or seed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Satisfaction, or money back.

10 lbs. (10 gals.) $1.25 and postage. 20 lbs. (20 gals.) $2.50 delivered. 50 lbs. (50 gals.) $5.00 delivered.

Jersey Yearling "Comes Back"

LUCKY FARCE

BY completing a year's test with a production of 18,014 pounds milk, 938.75 pounds fat, the Jersey cow, Lucky Farce, proves it is possible for a cow to make high records at an early age without affecting her usefulness as a producer in later years. Lucky Farce was at one time the yearling champion of the Jersey breed with a record of 14,260 pounds milk, 635.7 pounds fat. In her second official test she produced 14,184.8 pounds milk, 708.5 pounds fat, as a junior three-year-old. Both of these are double letter records, as she carried a calf more than 155 days in each.

After making these two records Lucky Farce's career has been somewhat checkered. In the nine years of her existence she has been owned by seven different breeders, which made it almost impossible to give her further opportunities at official testing. However, her present owner, A. W. Murphy of Ohio, believed her capable of making a good record, and at the age of eight years and three months Lucky Farce was again placed on test. In the record she has just completed, she produced 938.75 pounds fat. This record is the best ever made by a Jersey owned and tested in the state of Ohio.—AMERICAN JERSEY CATTLE NOTES.

Iowa Dairy Council at the Fairs

During the past season the Iowa Dairy Council has taken advantage of the county and district fairs, as well as the state fair and the Dairy Cattle Congress, in promoting the consumption of dairy products. Through the home demonstration agents, county agents, and county nurses, the largest of the county fairs were placarded with posters on dairy products. "The Magic of Milk", "Ice Cream a Nourishing Food", and the milk bottle poster were very popular for these purposes. In all, over fifty county and district fairs were supplied with these posters and other material covering the same work.

At the Iowa State Fair and the Dairy Cattle Congress large replicas of a milk bottle, a pound of butter, a brick of ice cream, and a slice of cheese were displayed. On each of these was printed, briefly, information on the food value of the product. The milk bottle, eight feet tall, was set up and slowly rotated. The wording of the milk story on the bottle was arranged so that it could be read progressively as the bottle revolved. Surrounding the cream line on the bottle were many pictures of healthy children. Below them were printed the words "The Healthy Child is the Cream Line of a Nation." Other short phrases descriptive of milk's value were printed on the bottle. This bottle proved to be a great attraction to women and children alike and put over a story that would have otherwise been difficult to accomplish.

The replicas of butter, ice cream, and cheese were in proportionate size to the bottle and each carried short statements as "Butter, the vitalizing spread for bread," "Butter is a wholesome, palatable, and absolutely essential food," "Ice Cream, the nourishing food desert," "A Dish of Ice Cream every day will mean greater health, strength, and vitality", "Cheese, the meat of milk", "Of all the muscle building foods, cheese is the most economical."

A small screen was hung in the booth and motion pictures thrown upon it during the afternoon and evening. The film used was one provided by the National Dairy Council which portrays the milk fairy play. This play tells of Johnny, a young lad, too busy with his play to eat sufficiently and especially so when milk was offered him. When mother's back was turned the milk generally went to the cat via the breakfast food bowl. Later Johnny is seen playing vigorously but he soon tires and returns home for lunch. Lying down for a few minutes' rest Johnny falls to sleep. In his dreams he sees before him all the virtues of milk in fairy forms. The sugar fairies, the lime and phosphorus fairies, the water fairy, protein fairies, and so on, each of them telling Johnny just what they will do for him if he will but allow them to do so by drinking plenty of milk. When Johnny awakens he has this story so firmly fixed in his mind that he immediately sits down and drinks a whole quart of milk which he finds on the back porch! A very instructive film and one which can be obtained for use by dairymen from the national or state dairy councils.

Iowa. W. A. WENTWORTH.

Cow Waters Herself

and Increases Milk Yield 15% to 20%

That's what happens when the cow has a Libbey Automatic WATER BOWL within reach.

Milk is 87% water, and milch cows must have an abundance of water—whenever they want it, day and night—if they are to yield as much milk as they are capable of yielding. Cows that are watered at a trough two or three times a day never drink as much as they need, and the lack of water cuts down the milk supply. This is especially true in the winter, when a supply of water outdoors is so cold that the cows will not drink nearly as much as they need. In many herds, the cows produce only a small quantity of milk because they do not drink enough water.

Every farmer who has installed Libbey Automatic Water Bowls in his stable, and reported accurate comparisons, before and afterward, has proven that they actually increase the milk supply from 15% to 20%. Some cows have shown an increase of as much as four pounds of milk per day.

Libbey Automatic Water Bowls

The Libbey Bowl is a wonderful improvement over all float tank systems. It is a new invention, having been on the market only a few years, but in that time 75,000 Libbey Bowls have been sold.

Each Libbey Bowl is automatic—that is, it controls its own water supply and is operated entirely by the cow.
No float tank is required, and bowl operates perfectly under any pressure.
Bowls may be placed at different heights and in any kind of stall or pen.
They cannot overflow and cannot get out of order.
No water is left in bowl to become stagnant or for animal to splash out and wet the stall.
No water can pass from one bowl to another, preventing the spread of contagious diseases.
It is the **only** automatic bowl that has a **dirt strainer protection for its valve,** which absolutely prevents any dirt in the water from hindering operation of valve.
It is the easiest to install, and costs the least of any bowl made.

WHAT THE FARMERS SAY:

11 Cows Gain 40 Pounds of Milk
Robert J. Plenty, Rice Lake, Wisconsin, wrote: "The Libbey Automatic Water Bowls are a money-maker and time and labor-saver. My 11 cows gained 40 pounds of milk in one day, after installing bowls. I would not be without the bowls for a good deal."

Libbey Bowl is Very Superior
Guy D. Power & Son, Pankhurst Farm, Auburn, N. Y., wrote: "The water bowls purchased of you in January are giving good satisfaction watering our herd of 54 milk Ayrshires and Holsteins. The Libbey Automatic Water bowl is a very superior one and is of valuable aid to dairy farmers in increasing their milk yield."

Best He Has Ever Seen
Alphonse LaBelle, Harris, Michigan, wrote: "I have been using the Libbey Bowls and the Libbey Stanchions for some time, and they are the best that I have seen. The Water Bowls keep up the milk yield of the cows and the Stanchions are mighty comfortable on the cow's neck and handy for us to use, so I consider them both good, valable equipments for any barn, and would not sell them for twice what I paid for them if I could not get more like them."

How the Cow Operates

A little water always remains in bottom of bowl. When the animal is thirsty, it attempts to reach this water and pushes lever to one side, which opens the valve and lets in fresh water about as fast as the animal can drink. When the animal has had enough, it will raise its head, and this lever will swing back to its mid-position in the bowl and the valve will close, shutting off the water.

Libbey Litter Carriers and Stanchions

Libbey Litter Carriers are simple, strong and easily stand the hard knocks without getting out of order. "Lock" and "trip" always on the job. Made to fit any size or style of stable. Save manure; your farm needs it.
If interested in Carriers or Sanitary Steel Stanchions or Stalls, ask for General Catalog.
If interested in Water Bowls, ask for Water Bowl Book, also **free Daily Milk and Feed Record.**

Handling Stray Bulls

HOARD'S DAIRYMAN:—The writer has just finished reading your article in last issue entitled "A Question" and asking if any one was ever recompensed and how for the services of a scrub bull when he has violated a line fence treaty.

I wish to say that I never was exactly recompensed but I sure got satisfaction. I had a bunch of 20 pure-bred heifers running in a pasture and my neighbor, who did not have a bull, bought a little scrawny Penn-royal bull which was about all head and put in the adjoining pasture.

I knew that the fence was weak (his fence) so I went to the gate which was 80 rods away from the heifers and called them. They came to me like a flock of chickens and when they were about half way to me I heard a crash and here came that bull like a quarter horse a bellowing every jump.

I opened the gate, turned the heifers through and into another lot and when Mr. Bull came I ran him in a double corn crib where there was a wagon loaded with grain. I called my man, got a rope, and in some way we hog-tied that fellow and when we turned him out in the road he was harmless. I expected to hear from my neighbor in no uncertain terms about it but to my disappointment he never mentioned the subject and neither did I, but I was never bothered again by his bull.

Now I have promised myself that I shall always follow this rule no matter how good the bull.

I never allow a bull to run in a pasture and think there should be a law passed in every state carrying a heavy penalty for any man to do so. This would not only safeguard the pure-bred herds but it would cause a terrible shortage in scrubs for every one knows it would not pay to keep one if you had to keep him up.

Illinois. R. F. JOHNSON.

The "STAY THERE"
Aluminum Ear Markers
are the best. Being made of aluminum they are brighter, lighter, stronger and more durable than any other. Fit any part of the ear. Nothing to catch on feed trough or other obstacle. Your name, address and any series of numbers on each tag. Sample tag, catalog and prices mailed free. Ask for them.

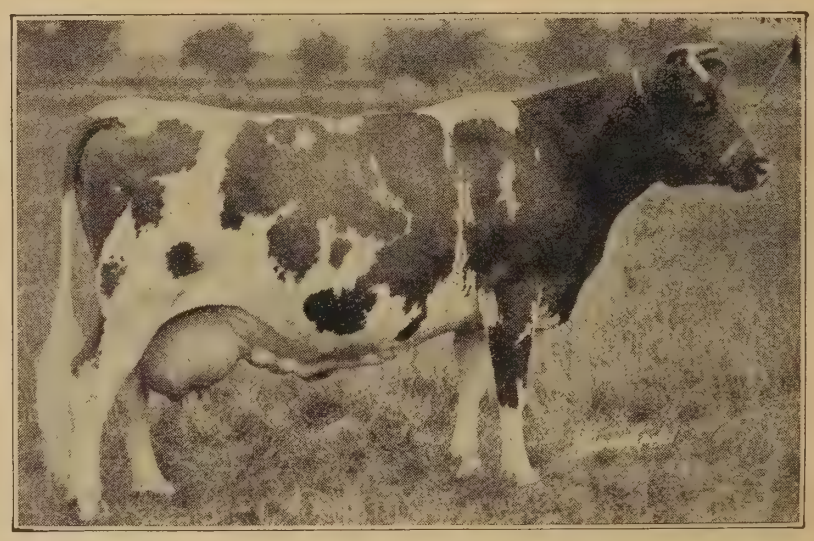
Jones & McKerrow Sale Averages $1,024

Jones & McKerrow of Waukesha County, Wisconsin, set a new record for Guernsey sales in the state on October 26 when they sold 38 animals for an average of just over $1,024.

It was featured in their advertising as their First Quality Sale and proved to be that, in fact, including as it did practically all members of their 1920 show herd in addition to 15 or 20 others of similar quality.

Mildred II of Les Godaines, undefeated grand champion of the entire circuit, upheld her reputation here by topping the sale at $13,500, the third highest price ever paid for a Guernsey female at public auction and the highest price ever paid at a Wisconsin sale. She was purchased by Frank E. Swan of Wisconsin with Lovell Gable of Pennsylvania bidding for Geo. W. St. Amant of Massachusetts, the last contending bidder. Before the sale was over, the cow was owned by Mr. St. Amant at an advance in price.



"Mildred", it will be remembered, was purchased at the Dupee sale in July for $2,700 by Jones & McKerrow.

times but the few bulls that were entered did not, in all cases, bring as much as they were worth. Bonny Boy of Riverdale, a proven sire and one that stood well up in the money at the shows this fall, was purchased for $425 by L. O. Jacob of Minnesota.

Love, Benjamin, and Jones did the selling with Chas. L. Hill reading the pedigrees.

Following is a list of all animals bringing $500 or more and buyers:

Geo. W. St. Amant, Massachusetts	
Eidelweiss of Edgemoor	$2,100
Spring Maid of Edgemoor	1,550
Frank E. Swan, Wisconsin	
Mildred II of Les Godaines	$13,500
Century Girl of Edgemoor	4,500
Radisson Farm, Minnesota	
Ultra Rosie	$750
Ultra Elizabeth Beauty	650
Dancing Girl of Edgemoor	1,000
Chene King's Northern Lady	600
Evangeline of Aurelian Farms	850
Kate of Aurelian Farms	825
C. A. Tuttle, Wisconsin	
Belva King	$500
M. S. & C. A. Skaar, Minnesota	
Topsy Ultra Lily	$600
H. A. Kurtz, Wisconsin	
Ultra's Governess Chene	$1,000
Victor Stiehl, Minnesota	
Dora's Beauty Pride	$500

IMP. MILDRED II OF LES GODAINES, GUERNSEY COW SOLD IN THE JONES AND McKERROW SALE FOR $13,500. SHE WAS UNDEFEATED ON THE 1920 SHOW CIRCUIT

Nor was that the only honor going to the aged matron at the sale. Her daughter, Century Girl of Edgemoor, by Dairymaid's Nonpariel of Iowa, and an undefeated two-year-old this year, stood second in the price list, going to Mr. Swan for $4,500.

The female offering sold well throughout with brisk bidding at all

Bratmoher & Brandt, Minnesota	
Imp. Governor of Myrtle Place II's Nelly	$500
Imp. McKerrow's Olinda	500
T. H. & J. R. Marsden, Wisconsin	
Daisy's Yeksa of Sunny Valley	$500
W. E. Fisher, Wisconsin	
Imp. McKerrow's Governess Carteret	$725
W. D. James, Wisconsin	
Silver Gem of Cedar Home	$1,475
T. A. Erickson, Minnesota	
Daisy Sark's Heirloom	$585

Guernsey Breeders Organize

Guernsey breeders of Marathon County, Wisconsin, at Wausau October 21 organized the County Guernsey Breeders' Association and went on record favoring calf club work and an intensive drive against scrub bulls.

A carload of dried sugar beet pulp was subscribed for by breeders living about Wausau, Elderon breeders already having ordered a carload.

County Agent F. G. Swoboda suggested more Advanced Registry testing, calf club work, pushing of a vigorous pure-bred bull drive, and cow testing association work. G. R. Ingalls of Eau Claire, spoke briefly on the advantages of the 305-day semi-official testing period.

A. G. Burg in his talk "The High Spots in Guernseydom" told of the progress made by the breed in the county during the past year. He reported more high class sires being brought into the county than during any previous year. He stated that more men are doing advanced registry work than ever before.

R. K. McDonald in his address, "Boosting Guernseys", advised honesty and square dealing in all transactions and recommending having animals as represented and not selling culls to prospective breeders.

J. F. Thomas, representing the Wisconsin Dairy Council, emphasized the importance of supporting the dairy farmer's own business by consuming dairy products and by helping to advertise it. Any slight surplus in butter or cheese would readily be taken care of if farmers used butter entirely instead of consuming oleo as liberally as many farmers' families do. He referred to one instance where the director of a co-operative creamery boasted that he had saved $30 by using oleo in his household. What he saved by eating oleo he lost many times over on the price of butter because he and his neighbors and farmers too generally everywhere were doing as he had done.

Wisconsin. F. G. SWOBODA.

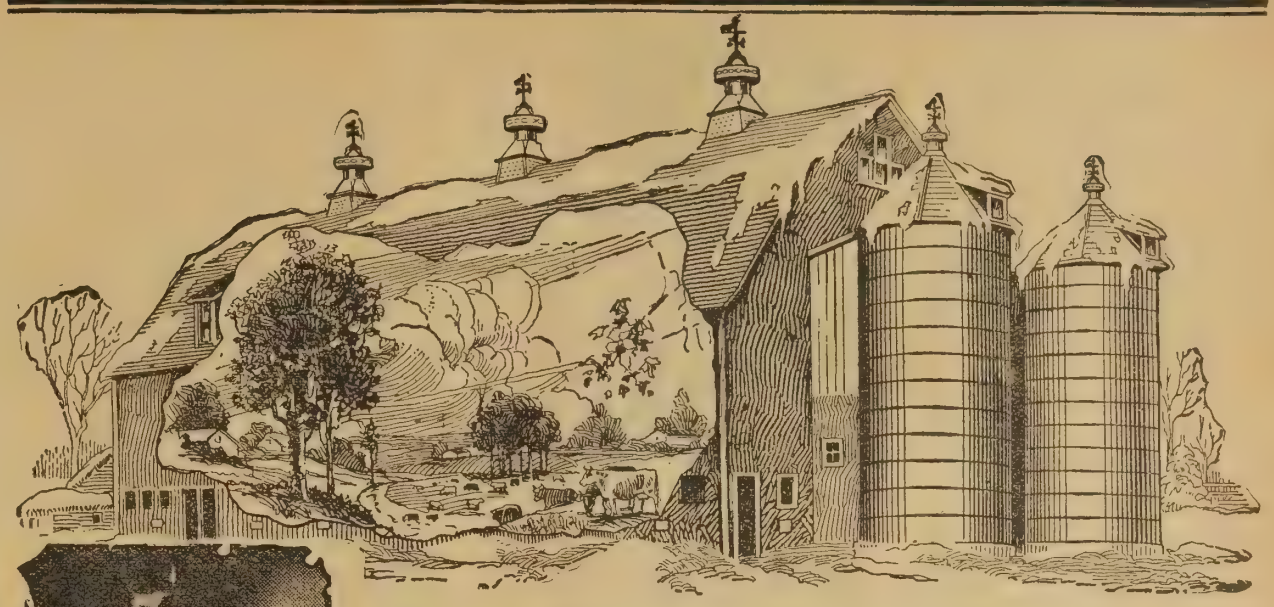
No matter how modern the farm machinery, it isn't a modern farm if the house hasn't modern conveniences.

1920 National Dairymen's Sale

In spite of the fact that Sale Manager E. M. Hastings did everything possible to insure its success, the 1920 National Dairymen's Sale was not entirely satisfactory. The entries were in the main outstanding good ones; the crowd was a good representative one most of the time, but the sale dragged and prices on many entries were far from high. "Tight money" perhaps explains this in part, but uncertainty regarding the cattle market for the coming year is a more logical explanation.

On the other hand, it was far from an unsuccessful sale. With 126 animals selling for $92,980, an average of $738; 28 going for $1,000 or more, 6 for $2,000 or more, and 1 for $6,600, to buyers from 16 different states and Canada, one would be far from wrong to call it a poor sale. It was not, but neither was it quite up to the consignors' expectations.

The Bridgeford Holding Co. of California paid the top price, $6,600, for S. P. O. M. 43rd, a son of S. P. O. M. and that famous cow, Aaggie Wayne Peep. 43rd was formerly the property of the Toyon Farms, also of California.



Carnation Stock Farms of Wisconsin and Washington purchased the highest priced female, Spring Farm Pontiac Maid 2d, a 6-year-old cow for $4,200.

Kelly, Hager and Mack did the selling, with S. T. Wood in the box and E. M. Hastings sale manager.

Following is a list of all animals selling for $750 or more and buyers:

J. B. Irwin, Minnesota	
Aaggie Echo Kalmuck	$1,210
Fairmont Posch Segis De Kol	1,400
Mountain View Farm, Maryland	
Josephine Johanna Oak De Kol	$3,150
Princess Beauty Calamo	800
Inka Calamo Beauty	775
Burke De Kol Rag Apple	900
Jennie Jewel Model	1,425

For your protection be sure this diamond King trade mark is on the ventilating system you buy.

Keep Summer Conditions in Your Barn all Winter

YOUR herd goes into winter quarters in the best of condition after the summer in pasture. But what condition is it in when it goes back to pasture in the spring? The answer depends very largely upon your barn. A poorly ventilated, damp, insanitary barn will lower the vitality of the healthiest herd. Lack of fresh air is indirectly responsible for much tuberculosis. Often disease sets in and spreads before the owner is aware of it. The best preventive is plenty of fresh air. Dampness in a farm building is a thief that is constantly robbing the owner of a valuable property and profits on his investment. It rots the timbers of the building and hastens the depreciation of everything in it.

With a King System of ventilation installed fresh air is kept circulating through every part of the stock room without drafts. Your stock gets plenty of oxygen, and as the temperature of the barn is better regulated your stock is kept more comfortable, and excessive moisture is carried out of the building.

There is no guesswork about a King System. When we accept your order for a King System we realize more than you do what responsibility we have undertaken to ventilate your building. Your ventilating troubles are over; our problem just begins. Our first move is to study the conditions in the building, then we plan a system to fit the building.

Send for Our Free Book on Barn Ventilation

Do not let this winter pass without giving your stock the benefits of proper ventilation. We can put in a King System at any time—whether the building is old or new, and whether or not the mow is full of hay. If you are going to build a new barn, hog house or poultry house send us the plans of the building or tell us about what you will need, and let us plan a King System to be installed while the building is being constructed. That is the best time to install it.

"On Time"

When your train roars in "on time," it means that every part of a great organization has worked with precision and fidelity to a schedule.

That is the sort of unfailing accuracy we have come to expect of railroad men. And that is what they, in turn, expect of the watches they carry.

The tremendous popularity of Hamilton Watches among railroad men is due to unfaltering accuracy and long life.

Regulations require that Conductor and Engineer compare time before the start of each run. That's what Engineer E. T. Reed and Conductor J. County, who together run the same Erie train, are shown doing. Both men carry Hamilton Watches, and both have a reputation for precise and punctual service.

Hamilton Watch

"The Railroad Timekeeper of America"

Aren't these the qualities *you* want in a watch? Time never was so precious on the farm as now. A Hamilton would help you divide up your day's work — would save minutes that quickly run into hours.

A Hamilton Watch makes an appropriate gift on any occasion — a splendid, lasting token of regard.

There's a model for everyone in the Hamilton line, with prices from $40 to $200. Hamilton movements alone, $22 (in Canada $27) and up. At your jeweler's.

Send for "The Timekeeper"— an interesting little book that tells about the manufacture and care of fine watches. The different Hamiltons are shown with prices.

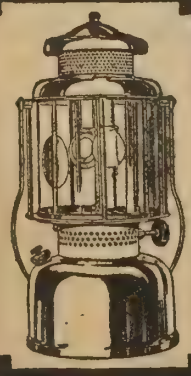
STERILAC Sterilizes Deodorizes Cleanses

45 Times More Germicidal than Pure Carbolic Acid
(BY U. S. HYGIENIC LABORATORY METHOD)

Sterilac is powerful, permanent, non-poisonous, and non-caustic, making it the ideal germ-destroyer and deodorizer. It sterilizes utensils, dishes and hands; protects against and destroys bacteria. More economical and effective than other disinfectants.

For Cream Separators, Milking Machines and All Dairy Utensils, Sterilac is a Daily Necessity



Because of its unusual strength, simplicity and safety, Sterilac should be used on every farm where dairy products are handled. Comes in the form of a powder, which quickly dissolves in water. It delays souring of milk, reduces the bacterial count and prevents spoilage and loss. It leaves no odor.

Sterilac also is ideal for cleansing and sterilizing glassware, earthenware and cooking utensils, for removing offensive odors in refrigerators, for "sweetening" foul-smelling drains and for killing typhoid and other germs in drinking water. Every farm home should have a supply on hand at all times. If your dairy supply dealer or druggist does not have it, send $3.00 for large bottle, containing sufficient for 250 gallons of solution. Write for free booklet, "How to Keep the Dairy Clean."

Abbott products are well known and recommended by physicians, veterinarians and druggists throughout America. DEALERS FOR STERILAC WANTED.

THE ABBOTT LABORATORIES, 4752 Ravenswood Av., Chicago

Coleman Quick-Lite

JUST the thing for lighting up your night work in the barn, feed-lots, milking sheds, tool houses, cellar or garage. Finest light known for night hauling, ploughing and harvesting, repair work, fruit packing, building, ditching, road-grading, camping, auto touring. Can't blow out in the wildest wind. Rain-proof and Bug-proof. Brilliant white light 800 Candle Power. Makes and burns its own gas. Lights with matches—no torch needed. No wicks to trim—no chimneys to wash.

Can't Spill or Explode Even If Tipped Over!

Inspected, tested and guaranteed. Will last for years. Pays for itself in fuel saved. Costs only trifle over a cent a night to use.

Take this advertisement to your dealer today. If he hasn't Quick-Lites on sale yet, he'll order one for you on approval. Send at once for interesting free book. Address Dept. 14

Dairying Thirty Years Ago

The importance of developing our home market for cheese can be seen in the fact that the industry is making rapid strides in the far, fair, and almost winterless south sea islands and that the product is being poured into the British market. Australia all lies between south latitude 10 and 40 and one of the New Zealand isles all north of 40, south latitude.

Only six years ago the New Zealand government offered a large premium to the factory that first made and shipped fifty tons of cheese to London, made within the year. Now there are some fifty factories that make an annual output of sixty tons each. This shows plainly that the dairy farmers of those British Isles are after our great foreign market for cheese.

If the American people would eat one ounce of cheese each per day, it would take four times as many cows as are now used to furnish milk for cheesemaking, to supply the home market. It is the cheapest and best animal food in all this land.

⚜

In every vocation there are all degrees of skill and in those pursuing them there are all degrees of natural capacity and fitness. It is not in the nature of things that all sorts of men, much less every man, should make a marked success in his vocation. First class men are very scarce; second and third class men are none too plenty, while of the men whose qualities in this comparison are denoted by higher figures, there is a great abundance. Now, these very men themselves, in speaking of other men, recognize this grade of ability, yet too many of them refuse to accept patiently their own place in the line. But they must learn and have to learn that there are no first class places for fifth class men. No amount of laws, however cunningly framed (and the cunning is generally on the wrong side), is going to change the situation. Farming is a good, safe, reputable, and pleasant business for good farmers. It has its disadvantages as well as its advantages—and in this respect it differs nothing from other ways of getting a living. Its superiority, so far as it has any, is in the greater personal freedom and in the chance a man has to grow. The intelligent, industrious farmer becomes a better farmer every year, and to men who are men this is the greatest commendation of farm life. Every recurring season the farmer has a chance to correct his mistakes and amend his plans. He is not, as a rule, subject to irrevocable disasters. He can "pick his flint and try again". In short, it is a good enough business for a good enough man.—BUCEPHALUS BROWN, in Rural New Yorker.

⚜

"Wanted, a thoroughly methodical farmer, of practical experience, to superintend a highly cultivated, neatly kept farm of several hundred acres. Must be skilled in cultivating grass crops and fattening cattle. Personal references will be required as to character and experience." The above literal copy from a New York agricultural newspaper is a good gauge of the character of farmers to be of value on good farms. He must be methodical, which means order, regularity, promptitude. He must have a practical experience, which means no mere theory, no half formed notions, no crudities. He must be skilled in cultivating grass, which means that he must fully feel the point that grass is the foundation of extensive farming. He must understand fattening cattle, which means that he must know when grass is fit to feed, what cattle are fit to feed grass to, what grain to feed, how much, how often, when to feed it, and as preparatory to feeding he must know how to prepare soil to grow cattle feed, how to manure crops, how to harvest, to house, and to make his whole energies turn into fat cattle of the finest kind. It is a small advertisement, but covers much more than the "several hundred acres" alluded to. Such positions offered to farmers who know how, but have not the capital to fully employ their capabilities, are grand openings to good men and encouragement to induce other farmers to qualify themselves to fill such positions. Character is a sin-qua-non.—Germantown (Pa.) Telegraph.

HOLSTEINS AND THE AIRPLANE

All is harmonious in a green pasture near Council Bluffs, Iowa, where a herd of Holsteins graze and from which an airplane flies daily. The cows don't seem to care whether men fly or not, but the pilot needs to exercise considerable care in his landing. Pilot Nielsen was a preacher before he took up flying, and the owner of the cows is Robert McIntyre, who is a producer of market milk.—G. R. HARRISON, Iowa.

There is Little Loss From Sorghum Poisoning

HOARD'S DAIRYMAN:—The sudden death of animals pasturing on sweet sorghums, grain sorghums, or sudan grass, when they encounter forage containing poison, has overemphasized the actual amount of loss sustained. Quite a number of stockmen in the Southwest have for 30 years each season grown a field of sowed sorghum of one variety or another and grazed it off without loss, turning on when the crop is as high as the steers' backs.

Over ten thousand farmers in Kansas grew sudan grass and pastured it

either all season or after removing one hay crop in 1919. Only three were known by the experiment station to have lost any animals from poison. The station is very apt to hear of such loss if any occurs. In addition to over 50 county agents, operating in as many counties, there are over a dozen extension specialists on various lines who visit all parts of the state. Had any large number of losses occurred they would have been reported and sudan grass would not be so popular as it now is.

This forage poisoning is due to the presence of prussic acid in the leaves of the growing plants. It is never present in silage that has cured for a week or two, or in dry, cured forage. It is apparently produced in a short time when the plants are stunted as by drouth, chinch bug injury, cutting the crop, and a subsequent slow growth of suckers or frost. Since sudan grass is naturally sending up new shoots at all times, growth is not slackened either by cutting or continued grazing as in the other sorghums. Hence we can not anticipate as frequent presence of poison if it is entirely due to a slackened growth.

The poison is so deadly and quick acting that animals driven across a strip of cane a hundred yards wide that contains the poison may nip off enough in crossing to kill them. Cattle that are poisoned fall to the ground and usually die in thirty minutes. If they are found in time they can be saved by drenching each animal with a quart of any kind of syrup warmed sufficient to make it run. It is said that sweet milk administered in the same way will prevent death.

The only known losses from sudan poison in Kansas in 1919 were as follows: A dairyman near Abilene lost two Holstein cows on pasture. The herd was turned on second growth after a crop of hay was removed. At the same time the experiment station at Manhattan, not over 40 miles away, was pasturing six pure-bred Holsteins on sudan grass. They were on the pasture day and night. Chemical analysis of samples taken of the crop at this time revealed enough poison to cause death, yet none of these cows ever showed symptoms of illness. This leads one to think that possibly a condition of immunity may be built up in animals continually grazing on this crop.

Another similar case was that of a farmer near Delia in northeast Kansas. He had five acres of sudan grass on which he pastured horses, mules, hogs, and his milk cows. None of his cows were ill. Yet a neighbor's cow which broke through the fence and grazed on the pasture was dead within the hour.

The third case of loss was with a farmer in Harvey County, near Halstead. His milk cows were turned on second growth sudan grass after a hay crop was removed. Two of them died from poison within a few hours. These are the only known cases of loss in the state in 1919. There were undoubtedly others but they were few. Up to the present time none have been reported for 1920.

Considering the large number of cattle at present pastured on sudan grass these losses are so small and infrequent as to be negligible. Loss has never been known to occur in a herd on sudan grass after the first day on the crop. Careful watching and administration of antidotes can prevent any loss in that short time. It seems probable, from evidence at hand, that the danger can be averted by such attention for a week at most after turning on.

Sudan grass has proven to be especially valuable for dairymen. It furnishes succulent feed at any time in the summer when other pasture is short. Its use for this purpose has become extensive in states other than the Southwest and will without doubt grow larger.

Kentucky. RALPH KENNEY.

TEXACO MOTOR OIL ★ THUBAN COMPOUND ★ HARVESTER OIL ★ AXLE GREASE

When the temperature drops, use a lighter oil

TEXACO

Tractol—*for Tractors*

Winter is coming on. Your tractor will be chilled. A change of oil will be needed, for, while the terrific heats and long grind of summer require a heavy oil, in winter you need one which will not thicken in the cold. Oil must flow freely. It must not be sluggish in the lubricating system and it must permit easy cranking.

There are three grades of TEXACO TRACTOL—"B", "C", "D"—these will take care of all tractor engines—large or small—in summer or winter. Grade "B" is intended for large engines in severe summer conditions. Grade "C" for large engines in winter. By winter, frost temperature (about 40°F) is understood. For smaller engines Grade "C" is used in summer, while Grade "D" is recommended for winter use.

TEXACO TRACTOL is shipped in 55 and 33-gallon steel drums, wooden barrels and half-barrels, and five-gallon cans. Try it. "You'll see a difference"—*now* in power, and *later* in your bearings.

Sold everywhere at this sign—the Texaco Red Star and the Green T

Empire Oil-Burning Tank Heater

Greatest improvement ever made in tank heaters. Fits any tank. Burns from 14 to 16 hours on one gallon of kerosene. Any child can operate it with safety; no sparks, ashes or smoke. The heating chamber is entirely under water; no heat wasted. Guaranteed. Saves feed—pays for itself repeatedly.

Empire Non-FreezableHogWaterer

Made of heavy galvanized iron — large capacity (70 gal.); drinking trough on outside where hogs can reach it; oil burner directly under trough—guaranteed not to freeze. Keeps water warm at a small cost. An abundance of fresh, clean water at right temperature. Keeps hogs healthy—fatten faster on the same feed.

FARMER AGENTS

Special offer to farmers willing to show our Heater and Waterer to prospective buyers. Write at once for price and special offer. Buy direct from factory.

Empire Tank Heater Co. 109N. 7th Street Washington Iowa

EDITORIAL COMMENT

SORGHUM POISONING

It is a well known fact that many of the plants belonging to the sorghum family develop hydrocyanic acid, a deadly poison to live stock under certain conditions.

Sudan grass belongs to the sorghum family, and it has been found that in a number of instances cattle that have eaten freely of this grass have died. As near as we are able to determine, fatalities have occurred when cattle were permitted to eat freely of sudan grass and were not accustomed to it.

Professor J. B. Fitch of the Kansas Experiment Station says: "Last summer we had six Holstein cows on sudan grass pasture and we took a great number of samples of this grass and tested them for hydrocyanic acid. We found hydrocyanic acid in large amounts each time we took samples, but in spite of that fact we had no objectionable results. I have heard of three or four cases already this year where animals were turned on sudan grass and fatal results followed. In each case investigated, the animals had been turned on for the first time and had been allowed to stay long enough to get filled up on the grass. Where the animals are accustomed to the sudan grass pasture there is evidently not so much difficulty from poisoning. While we generally recommend that the grass should not be pastured after frost, we had six cows on sudan grass pasture last year until after frost and did not notice any ill effects."

Elsewhere in this issue will be found an article discussing the danger of cattle being poisoned and permitted to graze on sorghums, methods of avoiding it, and remedies, should the owner find the cattle suffering from the effects of hydrocyanic acid.

LIMITING PRODUCTION

To increase prices of farm products, there are those who would limit production. This body of men takes exceptions to those who advocate increased production, holding that large crops do not bring as good returns as small ones to the farmer. It is well to know that when there is a large supply, prices fall, and, when short, they rise. Years may be recalled when short crops returned more to the farmers than when there was a large production. This is a principle that needs no argument for it has been recognized by economists for years. This principle, however, cannot be applied to the individual farmer, for it is well known that the farmers whose acres produce the largest crops, whose cows produce good flows of milk, are the ones making the most money. We do not mean farmers who hoe their corn by hand or use unusual methods of caring for and feeding their cows, because such practices may cost more than the increased production will return. What we do mean is, the farmer who handles his land well, fertilizes it; the man who breeds good cows, feeds and cares for them properly, is the one receiving the largest returns. Farmers cannot hope to make profit by limiting production of the individual cow or acre. There are certain fixed charges on every farm which must be met—investment in the land, the cows, equipment; and the largest profit is made by having the fields and the live stock work efficiently.

If we are to limit the production of agricultural products, it must come by operating less land. We have seen no necessity of the United States government expending large sums to bring under cultivation the arid lands of the West, stump lands, etc. We believe some work in this direction should be constantly carried on and these lands brought gradually under cultivation as the demand for food products increases, but to carry on the work on the scale desired by some would be a mistake. There are thousands of farms in this country now that are not being operated, largely because they are low in production; notwithstanding this, more than enough farm products have been produced to feed and clothe the people of this nation; in fact, we export millions of bushels of wheat and considerable quantities of meat products.

It would seem a mistake for any farmer to feel that he could make a larger profit by permitting his acres to produce low yields or to handle his cows in such manner that they would give smaller quantities of milk. Reduce the acres, reduce the cows, especially eliminate the poor ones rather than follow the practice of low production per farm. The true farmer will make his acres and his cows produce maximum yields without forcing them with extra care and labor.

IMPORTANCE OF VENTILATION

The barns in which the National Dairy Show cattle were kept this year, where demonstrations were held, and the judging of cattle took place, need to be ventilated. It is nothing short of a crime to place valuable dairy animals in an atmosphere like that found at this year's Dairy Show. Few people seem to be concerned about this matter, although before the end of the show five valuable animals had died and several more were in the hospital, some of which were not expected to live. One of the cows that died was valued at $10,000. An offer of that amount had been made for her. It is probably a conservative statement that the animals lost at this year's Dairy Show would pay for the expense of ventilating all the buildings used for exhibition purposes.

We have been astonished at the indifference of those in charge of the buildings in which the Dairy Show has been held in regard to ventilation. This year, the weather being warm and not much air stirring on the outside, there was created such a condition within the buildings that even the most indifferent person could appreciate the necessity of expending some money to ventilate them. Opening the windows would be the way some would overcome this difficulty, but drafts are not a good thing, especially on show animals or cows producing milk.

There is a way to install a ventilating system which will purify the air of these stables without creating drafts and which will provide a wholesome atmosphere for both man and beast. We trust that the Dairy Show officials will protest most vigorously and demand of the owners that the buildings be properly ventilated before next year's Dairy Show.

STICK TO THE LEAGUE

The New York Dairymen's League is weighing its members in the balance. If they prove up, the future holds promise of better things for the milk producer; if they fail, the milk producer goes back to the old order of things in which he had no voice in the sale of his milk and he will only need to read the posted notice to find what the buyer of his milk has decided to give him.

To make itself effective, the League proposes to pool milk that members shall share alike in returns regardless of the price each man's product may bring. It is taking a lesson from every successful co-operative organization, from the small, co-operative creamery to the prospering fruit growers' associations of California. To insure against the cupidity of any members who might be tempted to sell their product elsewhere, the League provides a contract which has "teeth in it". Fifty thousand of the eighty-five thousand members must sign this contract, agreeing thereby to stick to the League, before the pooling provision is put into operation.

The present League is the result of years of organization work. It is the producer's expression of his constant need for organization. It was formed because of conditions which were very unfavorable to the milk producer. If it has failed to do everything, it has at least brought a large measure of relief. No better scheme for protecting the producer's interests has been evolved. At present it constitutes his only hope that he will continue to have a hand in selling the product of his herd.

If there are faults in the contract as it now reads, why not take steps to remedy them—and not refuse the backing the League needs now? If the officers have failed to render full service, as some of these balky horse breeching strainers aver, let that difficulty be corrected within the League rather than endanger the future of the producer by refusing support at this time. If the ship's officers are not satisfying, it is a poor plan to jump overboard into a rough sea. Some pooling system seems to be necessary if the League is to accomplish results. The present scheme may need modifying. But the member who holds back because the contract is made water tight is the one who would desert at a crucial time without its binding clauses.

At the worst the pool and its contract seem safer than the uncharted course of men without an organization. It is surely safer to rely on the recommendations of the paid servants of the League than the bought attacks of proved falsifiers who take advantage of this time to attack the farmers' own organization. The danger of loss through the pool is not worse than the alternative of "catch as catch can" selling without its aid.

The League needs loyal support now. If it fails, the producer slips back a dozen years; if it succeeds, there is promise of better things through its work.

FIXING PRICES

It is not always easy to arrive at the price to be paid for a particular product. In the past the purchasers of farmers' products have set the prices which have been governed to a large extent by supply and demand, but there have been too many instances where these men have attempted to defeat the law of supply and demand and have brought the producers of farm products to believe that they should have something to say about the prices their products should sell for.

This condition has not been accepted in every quarter, and it is held by some that the farmer is exceeding his rights and interfering with trade and privileges that rightfully belong to others. It seems to us that the person who produces a thing is wholly within his rights when he places himself in position to obtain full market prices for his products, in fact, to demand market price.

Professor Hunziker, in his new book entitled "Condensed Milk and Milk Powder" states on page 44: "The midwest milk manufacturers, representing the milk dealers, market milk plants, and the condenseries in the Chicago district and in the middle western states, confer on the price to be paid for milk for the succeeding month toward the close of the preceding month and announce these prices for the coming month. Generally speaking, prices in Illinois are subject to the prices of fresh milk distributed in Chicago and St. Louis. Prices in New York and Pennsylvania are subject to the influence of the New York Dairymen's League and the price of the milk for distribution in the city of New York. The Wisconsin price is most largely influenced by butter and cheese prices."

It should be observed that since the organization of the Chicago Milk Producers' Association and the Dairymen's League these associations have had a part in arriving at what was a fair price for milk. Those who have not yet appreciated the service which these organizations are rendering the milk producers should consider the part they are playing at the present time in arriving at the price to be paid for milk. There should be no serious differences between those who purchase the milk and those who produce it, although we recognize that the producer desires to get all he can for his product and the purchaser desires to buy it as cheaply as possible. However, there are ways and means of determining the supply and demand and what the market will pay, and each party must be willing to accept market conditions.

Bordeaux Mixture

Please give me the combination for preparing the Bordeaux mixture.

Mount Vernon, Wash. E. R. K.

The most common method of preparing the Bordeaux mixture in small quantities is as follows:

A. Put twenty-five gallons of water in a barrel. Tie five pounds (or whatever amount is to be used) of copper sulphate in a bag and suspend in the water near the surface until dissolved.

B. Slake five pounds of lime slowly in a small amount of water and then add enough water to make 25 gallons.

C. Pour the two together slowly, and stir thoroughly or pour one into the other. Strain and apply as soon as possible. The mixture spoils if allowed to stand.

The best mixtures are made at a temperature of about 50 degrees F.

Wages for Buttermakers

Can you give us an idea what salary A-1 buttermakers and creamery men get?

Michigan. W. W.

The demand for good buttermakers and creamery men is still brisk. The wages paid competent men in this line of work have increased during the past year, and some of the best buttermakers of the state are getting over $200 per month at the present time.

We have found it somewhat difficult to keep our small force of creamery men at the dairy school during the past summer because the owners and managers of large creameries would visit us and hire the help we had about as fast as we could employ new men.

One large manufacturer of dairy products in this state informed me during the summer that he was paying $135 a month for can washers. I do not think this is the price all can washers received in such plants, but when these are located in towns where a great deal of machinery is made and high priced mechanics are employed, the creamery men, ice cream men, and city milk dealers have to pay their help higher wages than is the case where a dairy manufacturing plant is located in a different town or in the country.

There are but few creamery buttermakers, who have the responsibility of the successful operation of a small plant, who receive less than $150 per month even in a small country town where living expenses are not so high as they are in the city. I think, therefore, that the wages paid will depend a good deal on the demand for skilled mechanics and the cost of living in a given locality.

I believe the reorganized buttermakers' association of this state considers $150 per month as the minimum wage to be paid a man who takes the responsibility of operating a creamery and the scale of wages advances from this figure to a considerably higher one depending on the amount of butter made. E. H. FARRINGTON.

Wisconsin College of Agriculture.

Cleaning Test Bottles

HOARD'S DAIRYMAN:—I believe I can improve considerably on Mr. Rogers' method of emptying and washing test bottles. At the time I was doing official testing, I employed the following method:

As soon as all the samples were read, I put on a pair of canvass gloves and took six bottles in each hand. I emptied these on the pile of ashes usually found in the farmer's backyard or in a small hole I had spaded up for that purpose. The hotter the bottles, the better I liked it. In cool weather, I placed the bottles back in the warm tester after reading so as to keep them warm until all had been read, when I took them out to be emptied.

In washing the bottles, I placed them in a zinc or granite pan. I then took a small baking powder can and bent a lip on the upper rim so as to make it easy to pour from. I first filled this can with hot water which I poured into the test bottles. After emptying the bottles again, I mixed up a strong solution of some good washing powder, poured it into the test bottles, and shook them thoroughly before emptying. The bottles were rinsed again with clean, hot water. I used the canvass gloves throughout the entire operation.

Care should be taken in emptying the acid residue from the test bottles in order that none of the acid gets on the gloves or on the clothes. After I got used to testing one pair of canvass gloves lasted me a whole winter and I never burned acid holes in my clothes or in the cloth apron I used. I have seen many testers whose clothes were full of acid holes after they had tested for only a week. Not only that, but there would be acid tests all over the testing room in which they worked. I see absolutely no excuse for this and a man should not be considered a competent tester until he can avoid such carelessness. Further, there is no excuse for a tester to leave crocks of acid residue or bottles of unlabled acid standing around after he leaves the place, because some one else has to do this work for him. Not only that, but many people have been severely burned, and especially children, by coming in contact with left-over acids.

Northport, Mich. H. W.

Moving Pea Vine Silage

Would pea vine silage be spoiled for keeping if two or three wagon loads were transferred from silage stack to small pit silo?

Hartford, Wis. J. P. D.

We are advised by men who have tried this system that there is likely to be a considerable amount of spoilage when as small a quantity as this is moved at one time. It is possible that, if this is fed within two or three days, the spoilage would not be sufficient to represent any considerable loss or damage.

We have reports from some pea cannery sections that this silage can be moved from the stack in rather large quantities and then ensiled, particular care being exercised to see that the silage is evenly distributed and well compacted. We would be somewhat sceptical about the success of this system of handling but it has been reported to us as proving fairly satisfactory. It would appeal to us as being most satisfactory to merely haul enough of this silage for use for not over two to three days, and preferably hauling daily.

The Storage of Manure

HOARD'S DAIRYMAN:—Theoretically the daily removal of manure is the most effective manner in which to handle barn wastes in order to conserve the fertilizing elements which these contain. Practically, however, it is often impossible to live up to one's good intentions in this regard. Inclement weather, condition of the fields, press of farm work, sickness, shortage of help, and other things operate to hinder one from going afield with the spreader each and every day. To offset these hampering circumstances, and to make possible the temporary storage of manure during such periods as these, some sort of provision must be made for holding the manure under conditions in which a minimum of deterioration shall occur.

The writer has made considerable study in four states of the means and methods employed by farmers in meeting this situation. As a result of his observations he is compelled to state, first of all, that comparatively few farmers anywhere in his field of study have equipment of this sort, although in communities where dairying is the chief industry it is more common than elsewhere to find that such provisions have been made. It is his belief that farmers handle their barn wastes much more understandingly as a rule than they did ten years ago, but the number who have built pits or shelters of any kind are few in comparison with the total number who farm the extensive acreage of the states with which he has had a personal acquaintance.

A rough classification of the various means which he found employed for temporarily storing manure is: pits, either covered or uncovered, and with or without cisterns; and manure sheds and houses or simple roof coverings either with or without concrete floors. Some of these have been quite elaborate; others very simple and inexpensive. Several of them have furnished an enlightening commentary upon man's lack of persistence in following out his good intentions, for in certain of these pits and shelters have been seen manure that was quite as badly "burned", or "fire-fanged", as though it had received no protection whatever. All of which indicates, perhaps, that no matter what sort of manure storage is provided one must use brains in operating it.

Pits and shelters are designed to serve two, and only two, purposes. One is to protect waste against leaching; the other is to prevent it from heating. It is in one of these two ways that manure deteriorates during the period that elapses between the time it is produced and the time it is distributed over the fields. Any sort of a pit or shelter will accomplish the end first indicated. Furthermore, it will do it automatically. A pit or concrete receptacle of any sort will retain liquids that seep from the waste. But the prevention of leaching is only half the problem—and perhaps the easiest half. To prevent heating, manure must be kept moist in order to drive out the air from which the bacteria of a manure pile derive the oxygen necessary for their activity. The open pit was designed with the idea that the usual rainfall would accomplish this automatically also. Sometimes it does; sometimes it does not. The upper part of manure held in a pit will dry out fully as easily as if piled on the ground, provided precipitation is below normal. Consequently, no matter how manure is held, it must be watched with some degree of care and if need be moistened enough to prevent bacterial action from getting under way at such times as the temperature is favorable.

Most of the larger and more elaborate pits which the writer has seen are equipped with underground cisterns for holding seepage. In some cases pumps are installed by means of which the contents of the cistern can be used for wetting down the manure in the pit. This, of course, is preferable to using ordinary water as the last only adds to the amount of liquid which must be handled and distributed later on. With labor so scarce and high in price there are other more profitable ways of using it than in the additional sprinkling required to distribute the diluted liquid manure. This is one of the chief objections to the uncovered pit equipped with a cistern. One must assume the responsibility of distributing, along with the liquid content of the barn waste, such rain as falls into the pit. To the writer's way of viewing it, the separation of liquid manure in this way necessitates so much additional equipment in the way of sprinkler cart, tank, pump, and so on as to make this form of manure storage impractical on all but large size dairy farms. Even here it is questionable whether the same ends may not be served in other ways at less expense and trouble.

In considering any sort of a manure container the problem of unloading it is one to be given serious thought. Pits of extremely large size are so made, as a rule, that a team can be driven directly into them and the spreader loaded without much trouble by working in from the side and maintaining an open space of flooring on which to operate the shovels. With smaller pits one must dig down from the top and throw the waste over the side into the wagon box. This is sometimes a difficult piece of work and if the manure is very moist it is a disagreeable one as well. There are more pleasant tasks than working in hip boots in a mass of soft, yielding manure. Taken all in all the writer inclines to the opinion that of the two the manure house or shelter offers the same advantages and fewer disadvantages than either the covered or the uncovered pit.

As regards the different types of shelters, in which a pit or receptacle forms no part, there are, of course, many ways of clothing the idea. In some instances the manure shed is made large enough to hold the spreader which stands under the end of the litter carrier track so that the waste can be emptied directly into it. Such a shelter can be equipped with doors and window coverings by means of which through the summer the breeding of flies may be considerably reduced. There are circumstances, of course, where this item does not bulk large, especially if the barn is at some distance from the house and if dairying is not extensively followed. There will be no more flies than usual if it is possible to keep even with the daily accumulation of waste through the summer. Consequently the simple roof covering will often answer full as well as the more elaborate and more expensive manure house.

As simple and practical a shelter as the writer has ever happened across consisted only of an attractively designed roof which sheltered three manure spreaders The litter carrier deposited its load directly into any one of the three. The accumulation of manure on this particular farm seldom exceeded the holding capacity of the three spreaders. If for any reason it over ran, the excess was dumped on the concrete floor with which the shelter was provided.

The psychological effect of the small pit or shelter is one point in its favor. The urge to empty it is greater and the accumulations at any one time are not large enough to appear staggering. Somewhat of the same feeling springs from a constantly growing pile of manure that the old darkey found in the pile of wood which needed sawing. Whenever he looked at it he experienced a "hesitatin' feelin'". The handling of the manure, while an important item in farm practice, is by no means one of the pleasantest tasks involved in farming. The chief aim in any system of handling it should be to keep the accumulations down at all times to the lowest point. As little of it should be handled twice as is possible. To do this, of course, means extra labor that in these days can be utilized elsewhere with more profit.

Washington Dairy Notes

HOARD'S DAIRYMAN:—Condenseries operated by the Canyon Milk Products Company at Enumclaw and Issaquah have closed down and it is reported that the concern is in the hands of receivers. The Carnation Milk Products Company has closed its plant at Kent and is practically confining its operations to the manufacture of butter in other Northwestern plants. The closing of these plants and the use of the milk of these districts for the manufacture of butter has effected a sharp decline in the butter market, the price dropping seven cents per pound during the week ending October 24th. On October 15th condenseries announced a decline in the price to be paid for fresh milk delivered at the plants from $2.50 per hundred pounds for milk testing 3.8% butterfat to $2.25 per hundred for milk of the same test.

⚜

A cow testing association is being organized in Thurston County and it is hoped to have 600 cows signed up at $2.50 per head in a short time. Failing to obtain the necessary number, it is planned to include several Grays Harbor County herds in order to fill the quota of 600.

⚜

A campaign to make Lummi Island, Whatcom County, a restricted district regarding the tuberculin test is meeting with excellent results. During August ninety-eight per cent of the dairy cattle were tested.

The campaign being carried on by the Whatcom County Farm Bureau to get 10,000 dairy cattle tested for tuberculosis will be discontinued for this year on account of the fact that the state appropriation to pay owners an indemnity for reactors has been exhausted. 4,500 head of dairy cattle have been tested thus far and applications for 1,000 more are on file at the office of the commissioner of dairying and live stock.

A milk testing demonstration was given at a request of the Enterprise Community Farm Bureau Dairy Committee after which a community milk testing club was organized and samples will be tested once each month. This community is carrying on daily milk record work as a farm bureau project.

⚜

The Walla Walla Pure-bred Jersey Bull Association has been reorganized for another year. A Holstein bull association is in the process of organization at Burbank in Walla Walla County.

⚜

Jay Finlayson of Yakima reports that he obtained sixty tons of sunflower ensilage from two acres of land this year and he is very well pleased with the experiment. "The raising of sunflowers for ensilage will be done on a large scale next year if that plant comes up to expectations as a stock feed," he says.

⚜

In Pierce County four communities have held special demonstrations for dairy stock improvement work under the auspices of the respective farm bureaus. One of the bureaus is conducting a campaign for the eradication of the scrub bull from all herds in the district.

⚜

On Lopez Island in San Juan County farmers are interested in Guernsey cattle and a canvas is being conducted in an effort to have them purchase a carload of pure-bred Guernsey heifers.

In the same county, on Orcas Island, a cow testing club is being organized and the county farm bureau has adopted as a project the testing of all cattle on the island for tuberculosis.

⚜

Arrangements for an excursion of several Pacific County dairymen into Oregon for the purpose of purchasing pure-bred animals have been completed. With 404 cows signed up in twenty-seven herds the Southwestern Washington Cow Testing Association is reorganized, with only five herds in the district covered by the association not signed up. Local banks contributed $100 each for the furtherance of the work of the association.

⚜

The Dairy Marketing Association now has over seventy-five per cent of the market milk in the Spokane district signed up for a period of five years in unbreakable contracts; while the Inland Empire has been divided up into seven districts, each district having its own member on the board of directors.

⚜

Out of a total of 614 cattle tested for tuberculosis in Island County only one reactor was found. The Island County Cow Testing Club has completed the first year of work and is planning to continue for another year.

⚜

In Cowlitz County farmers are planning to purchase registered

ADVERTISING THE GUERNSEY

Float used at county fair by breeders of the Juneau County, Wis., Guernsey Breeders' Association as a novel way of advertising the merits of the Guernsey cow. The first prize Guernsey cow, Imp. Busy Bee of Sarnia, was placed upon a hay rack neatly decorated and driven about the grounds. Some fifty gallons of milk were served to the people free of charge. This is the first year the dairy breeds have been organized in this county and considerable friendly rivalry was shown by the different associations to make the best showing. Guernseys led the other breeds in numbers with 57 head and carried away the coveted prize of Dominant Herd.

EASY WAY to CURE and SMOKE MEATS

WRIGHT'S HAM PICKLE

is a scientific preparation for curing meat. Contains all the necessary ingredients except salt. Cures meat better, with less work and gives delicious flavor. Wright's Ham Pickle is sold by your druggist—guaranteed.

WRIGHT'S CONDENSED SMOKE

made by condensing actual hickory smoke. Simply and easily applied with cloth or brush. Gives wonderfully delicious flavor—does away with old smoke house—saves 20 lbs. of meat out of every 100 lbs. A large $1.25 bottle will smoke a barrel of meat—guaranteed.

Wright Food Products Are Guaranteed

ASK YOUR DEALER for the genuine Wright's Smoke or Ham Pickle. Both guaranteed satisfactory or your money back.

Write us if your dealer can't supply you. We'll send you valuable book on smoking meat and explain how you can get a fine butchering set at factory cost.

IOWA GATE COMPANY
801 Clay St., Cedar Falls, Ia.

Guernsey heifers with a view of building up herds of registered stock. Two pure-bred bulls have recently been located in the county.

⚜

A preliminary meeting of four of the leading Holstein breeders of Kitsap County was recently held and arrangements made to call a general meeting at a later date of all those interested in promoting the Holstein breed in the county. Dairy Husbandman Kehrlie of the United States Department of Agriculture spent two days in the county working on the organization of a bull club.

⚜

In Klickitat County plans are being formulated for the organization of two bull associations. Three pure-bred Holstein bulls will be placed in as many herds in one association, while the other association favors a milking strain of Shorthorns.

⚜

A cow testing association is being organized in Snohomish County and 540 cows have been signed up at $2.50 per head. A total of 600 will soon be obtained.

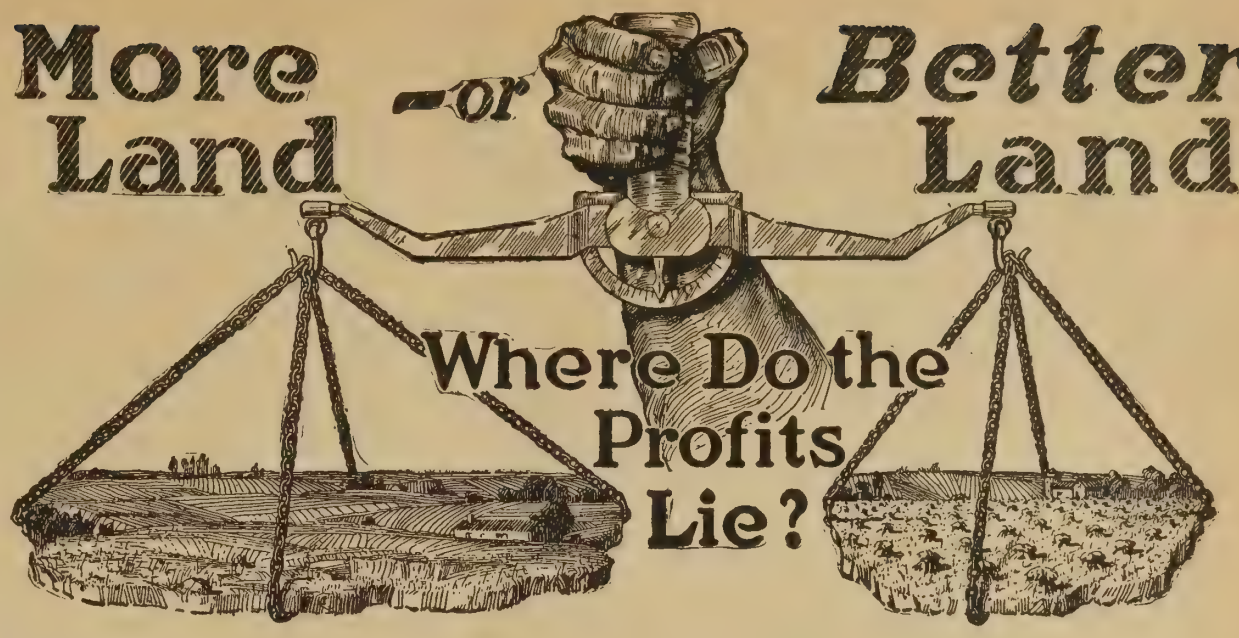
Bull associations have been formed in the Silvana and East Stanwood districts where it is proposed to purchase Guernsey animals.

⚜

A summary of the live stock project work in Grays Harbor County for this year shows that through the efforts of the farm bureau twenty-two pure-bred bulls and twenty-one cows have been placed in addition to thirteen bulls and ten cows purchased by farmers independently of the bureau.

Washington. ALTON D. HURLEY.

Tainted Milk



About this time every year numerous complaints are received from consumers and milk dealers in relation to milk having bad flavors and odors, in other words, tainted milk. As a general rule the keeping qualities of the milk are not affected but the general quality of such milk certainly is not up to standard. A careful study by experts employed by the government has shown that for the most part these bad flavors and odors can be avoided by the use of proper precautions.

One of the causes of tainted milk is the failure to properly clean and ventilate the cans. It is impossible to completely sterilize every milk can that enters a receiving station or milk depot. The germ life which is living in the so-called "sterilized" cans starts decomposition or rotting of any small particles of material which may have become lodged in the can. Unless the covers are taken off soon after the can is returned it will shortly have a very noticeable and disagreeable smell. All this trouble and annoyance can be avoided by placing the cans in an inverted position on stakes or a rack, with the covers off. Cans having rust spots in them or open seams harbor dirt. For this reason, such cans are condemned as being insanitary.

Warm milk will absorb any and all odors which it comes in contact with. It is very easy to see why milk stored in an ill smelling milk house or in a stable will have a "cowy" or "off" odor. Keep the milk can away from the stable at all times. Each pail of milk should be removed from the stable immediately after it is drawn from the cow.

The presence of dirt, manure, etc., in milk will also give it an off flavor. This can be avoided by following out a very simple but important precaution—wipe the cows' udders and flanks with a damp cloth each time before milking. Too much emphasis cannot be placed on this important duty.

During the fall season milk having a disagreeable bitter taste is received from certain localized districts. This is the result of the improper feeding of sugar beet tops or the like. It has been found that by feeding tops *after* milking that much of this trouble is avoided. A safe rule to follow is to avoid a sudden change of *any* feed. These sudden changes are sure to produce ill effects which are noticeable in the milk. It is a wise precaution to feed some other roughage with beet tops. Don't allow the cows to gorge themselves on beet tops at any time.—Flint, Michigan, Health Department.

THREE hundred acres ***worked right*** will bring more farm profit than the whole state of Patagonia.

Unproductive land is no asset. The number of acres owned never fattened a bank account. It is ***bushels per acre*** alone that swells income to the high tide.

See Your Dealer Who Sells the New Idea Spreader

Find what it is doing for farmers everywhere

Learn its cost. Then compare this with the cost of a few more acres of land.

And compare the final results that land or spreader will give, the increase in bushels harvested, the actual added profits.

More than one hundred thousand high production, big value farms owe success to the regular spreading of manure with a New Idea. Ten to twenty percent of their yearly crops are due to this advanced type, scientific machine. This is positive, demonstrated increase--net bankable, added income--made possible only by greater fertilizing efficiency which the New Idea gives.

You can get other spreaders cheaper. Naturally! But then, why change from the old wagon and pitchfork method at all, unless you want, and aim to get, *the best?*

Our Gold Seal Guarantee absolutely protects you against breakage or defects.

You get More Milk or Your Money Back

No matter how much milk your cows are producing on their present ration — Larro-Feed must make them produce more — or your money back.

That is exactly what the Larro guarantee means to you — more milk or your money back.

The one way to put your dairy on a business basis is to find out exactly how much you are feeding each cow and exactly how much milk she is giving.

Weigh Your Feed— Weigh Your Milk

This has been our advice to dairymen for eleven years — it is the secret of the success of the men who feed Larro. They *know* just what they are doing and they have learned that it's not how much a feed costs but how much milk it produces that is important. That the feed which makes the most profits is the cheapest feed they can buy.

Write for the names of Larro users in your neighborhood and the name of the dealer nearest you.

Larro-feed
Many Imitations Prove Its Superiority

The Farmer and His Hired Man

(Continued from page 735)

even be sued successfully if he quits under such circumstances. The equality, however, is not actual in many cases, because on the one hand the laborer often cannot quit because he must have a job, and because on the other hand the punishment for breaking a contract does not reach a laborer except in the rare cases where he has unexempted property. These two inequalities need providing for in some way before the labor problem can be said to be solved from a legal point of view. If not, when labor is growing scarce, as in agriculture at present, laborers will be free to quit when the fancy takes them, and during hard times they will have to cling to their jobs no matter what injustice is done them.

Farmers and other employers nowadays frequently try to arrange for payment of the damages in advance in case a laborer quits before his time is out. One method is to pay the laborer a bonus if he stays out his time, or one wage if he stays part of his time and a larger wage if he stays full time. Such bargains have good legal standing. Another bargain frequently made provides a certain wage "if the laborer stays until his time is out," and nothing is said as to what he will get if he does not stay. Such bargains are bad, because the laborer is entitled to the going wage for what time he does put in under such a bargain, and, furthermore, the courts will give it to him. Such a bargain amounts to no wage having been agreed upon in advance in case a laborer quits.

Matters of Duty

If farmer and hired man are to prosper together, they must do much more than live up to the letter of the law. They have duties to each other as brother men.

1. Hired men must use with justice their right to quit a job when they will, and farmers similarly their right to discharge a man when they will. "I have seen a hundred men fired," said one hired man, "and never one of them was given more than time enough to pack up his clothes and git." Freedom of action presupposes common sense and justice in using it, and if men do not seem to possess it, the only remedy lies in more laws and more restrictions.

2. Hired men and farmers are in duty bound to consider each other's welfare. The farmer should be interested in the hired man's future. He should help him to save his money, to become a first-class farmer, and to get started for himself as soon as possible. The hired man, on the other hand, should be willing to work as hard to save a load of hay as his employer.

3. The farmer will find it best to treat his hired man as an equal. All men are not equal in many ways, in intelligence, in knowledge, in wealth, and in experience. Consequently laws sometimes have to be made to protect the weaker members of society. But meeting as man to man in the everyday affairs of life, on the street as preacher, bricklayer or merchant, on the farm as farmer and hired man, they all expect to have their rights and their personalities respected. No matter how unfortunate in their lives, few persons are without some spark of pride of self. Those things which make up their own selves they hold sacred, and no man shall trample on them and not be cursed for it. The employer who so misuses an employee need not expect his good will and co-operation.

Fair Dealing

An important rule for dealing with hired men is to be careful not to hurt their self-respect. This rules out such practices as these:

Swearing at hired men or calling them abusive names.

Ridiculing them. Sarcasm cuts deepest of all.

Dictating to them on all occasions, instead of leaving as much as possible to their judgment. Instructions must be given respectfully, and the fewer orders given the better. The main job of the manager is to lay out the work for the day and then assign to each workman the part which he is to do.

Talking about their faults and mistakes with the neighbors.

Letting the women folks help do the bossing.

Giving the hired men all the menial or unpleasant tasks, such as waiting upon members of the family. The time is far past when a farmer can safely sit in the house in nasty weather while the hired man husks corn or splits wood. The farmer who plays fair, however, usually finds hired men willing to do their share of anything.

"Calling them down" for their mistakes, instead of explaining to them what is wanted. A good man is sensitive about his mistakes, and a wise employer respects his feelings. Cor-

OAK PARK VENUS, JERSEY COW OWNED BY UNIVERSITY OF BRITISH COLUMBIA

As a 4-year-old she produced 12,579 lbs. milk, 630 lbs. fat. This gives her rating as the second highest producing Jersey of that age in Canada.

rections should be made quietly and in the form of off-hand suggestions, if possible.

Making them live in servant quarters, kitchens, or the like.

Patronizing them. This is unconscious most of the time. When an employer feels himself of superior clay, he can hardly keep it out of his manner and his voice. Others patronize by trying too hard to please the hired man, making too much fuss over him, all of which makes him decidedly uncomfortable. All that is needed is a simple, frank, natural manner, like that of two neighbors talking over crops together.

A Reasonable Farm Day

Many farmers are today managing on an 11½-hour workday in summer and a 10-hour day in winter. Still more are getting along on 12 hours in summer and 10½ hours in winter. Few people who understand farm conditions will object to 11½ hours or even 12 hours in summer.

Following is the way in which one farmer breaks up 11½ hours of work in summer:

5:00— 6:30	Milking and chores.
6:30— 7:30	Breakfast.
7:00—12:00	Field work.
12:00— 1:00	Dinner and "nooning".
1:00— 5:00	Field work.
5:00— 6:00	Milking and chores.
6:00— 6:30	Supper.

This division of the day gives 9 hours for field work, 2½ hours for chores, and 2 hours for meals. Milking comes at the same time night and morning. It gives 2½ hours in the evening for rest and recreation and allows 8 hours sleep before 5 o'clock the next morning. The 9 hours for field work will seem short to many farmers, and undoubtedly the teams ought to work longer hours at busy periods. Chores and milking are done in less time on many farms, and on others the teams are kept in the field 9½ hours a day by having family help do more of the chores. Many things are to be said in favor of milking before supper, although it is not the usual practice.

Pacific International Has Record Entries

HOARD'S DAIRYMAN:—The outstanding division of the Pacific International Livestock Exposition to be held at North Portland November 13—20, will be the big dairy section in which there will be nearly a thousand animals in the various breeds. Definite assurances that the coming show will be the largest and most important event of its kind ever staged west of Chicago are given by the official entry books which closed with an average of 60 per cent over last year in all breeding classes. In the dairy division the increase runs even higher.

The leading section of the dairy division will be that of the Jersey classes, in which 325 head from the finest herds throughout Western Canada, the Pacific Slope, and Intermountain states, have been listed. Few fairs have been able to report Jersey sections of this size, and the Pacific International's showing will probably be one of the largest ever assembled anywhere in the United States.

The Holstein breed will have almost equally as large a showing as the Jerseys, 280 animals in this class having been entered, including a goodly number of world champions and entries from Holstein herds nationally famous. The Northwestern states will make a strong showing in this breed, although there will be competition from California and British Columbia.

The increasing popularity of the Guernsey breed in the west is indicated by the substantial showing of entries in this breed, totalling 153. Washington and California will give Oregon strong competition in this section.

The Ayrshire breed, which was represented by only three or four animals last year has come to the front with exhibits, and this section will include some very fine entries. In addition to the dairy breeds, there will be upward of 60 milking Shorthorns and a considerable number of Red Polls, these dual-purpose breeds, however, being properly listed with the beef breeds.

"We are going to have a notable dairy department this year," said Mr. Plummer the other day. "The dairy division will really be a show within a show. Taken in its entirety, the tenth annual Pacific International will be a record-breaker, and in each section there has been a remarkable growth since last year. We are particularly gratified by the splendid showing in the dairy division."

Oregon E. K. HILL.

Much soil fertility is lost every winter by soil washing or erosion. Put a stop to it by keeping the hilly lands in sod, planting a cover crop, providing underdrainage, filling the gullies with brush, etc.

Examine Armour's Dairy Feed at your dealer's, or write us for a sample and state in what quantities you usually buy. The Armour dealer will gladly supply you with Armour's Stock Feed and Armour's Hog Feed also.

A Secret of Feeding Dairy Cattle

"How many buckets of milk will we carry out for each bag of feed carried in?" men ask when considering Armour's Dairy Feed.

And it's a fair question. On it hinges the secret of successful feeding.

The secret is: Good feed goes the furthest, keeps the cows in the best health and returns the most milk for the money invested. Just as highest grade gasoline gives the most miles per gallon.

Armour's Dairy Feed is complete and may be fed alone as a concentrate with silage and roughage. Or it may be used in mixtures.

It gets the results because every element needed in milk production is present. Few dairymen who use it ever change. A test will convince you.

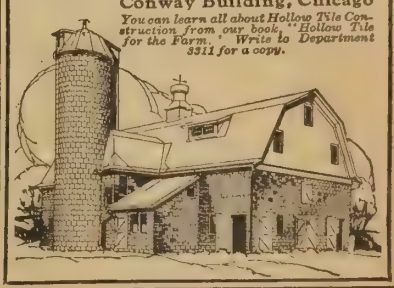
HOLLOW TILE

The Most Economical Form of Permanent Construction



Every consideration favors Hollow Tile as a building material for homes and all farm buildings. It is fire resistive and enduring—will last as long as the farm—and never requires painting. Made of burned clay, it will not decay. Buildings keep their value.

Hollow Tile is quickly and economically erected. The large units are easy to handle and lay. The first cost, which is relatively the same as good frame construction, is the last cost.

The air cells keep out dampness, protect your supplies, and insulate against the heat of summer and the cold of winter. To build of Hollow Tile will not only save you money but will increase the profits from your farm.

THE HOLLOW BUILDING TILE ASSOCIATION
Conway Building, Chicago

You can learn all about Hollow Tile Construction from our book, "Hollow Tile for the Farm." Write to Department 3311 for a copy.

An Answer to Pooling Objections

H. H. LYON, NEW YORK

THE so-called pooling contract, whereby New York dairy farmers hope to provide a method of obtaining fair prices without resort to the "strike", is a strong contract. If it were not it would be useless. It has been assailed by two parties commonly, those with ulterior motives and those who have not gone into it with a real desire to know what it means and provides. To the former class we have nothing to say. There are, however, honest people who object conscientiously. No one can compel these to get in real touch with the facts but some facts can be made known and conscientious people can be urged to fully consider.

So far as the writer knows there are but two points where honest objection is made. One of these is in relation to a clause which blocks any obstructionist from tying up the finances of the organization by means of injunctions "except in case of fraud". Remember that any fraudulent act opens the way for injunctions and an accounting at once. Our experience with certain dealers causes suspicion that bribery might be used to influence some farmer to get the injunction. Under the contract this will be difficult to accomplish. At the same time the state law compels an accounting by an actuary at frequent intervals. Safety is thus maintained.

The other item of criticism that is made much of by those without sufficient vision to take a fair look into the real merits of the plan is that of members liability. No one can do business without assuming risks, or at least should not be allowed to. Suppose that a stock company were formed as was the case when our farmers purchased the creamery in our town. Some of the farmers took stock to the extent of five hundred dollars at least. Should there be serious mismanagement in the affairs of this company, or even in the affairs of a bank or other corporation, as an illustration, the stockholders might lose the money thus invested. This is sound business form. In addition to that loss, in the case of a bank an additional sum equal to the stock held can be called for and collected. No one has doubt of the soundness of this plan.

Under the membership corporation where co-operators form the company there is no stock at all and liability is secured in another way, for liability there must be. Suppose that a farmer has twenty cows and that he sells 100,000 pounds of milk a year or an average of 8,500 pounds a month. This might bring $250 a month or $500 for two months. The pay for this milk would go to the co-operative headquarters and be apportioned from all dairymen to the members in proportion to the milk furnished and according to its quality. Payments are to be made on the 25th of each month for the previous month as is now commonly done. Scarcely $500 could be held by the association at any time from our twenty-cow farmer.

The next necessary step in proving heavy losses would be to place, by hook or crook, in control of the management a board of twenty-four directors, the biggest lunkheads in all creation or the same number of the smartest crooks that this world affords. No half way board of either sort can wreck the institution without being found out long before any material damage could be accomplished. The board of directors is chosen by farmers themselves by direct vote from their own number, and if you could see together the delegates of the several Leagues you would be ready to bet your bottom dollar that they will not get any such men in the directorate. They vote in county units for the men whom they know and trust and they are as cautious in selecting the men to handle their property as you are in selecting directors or a cashier of your bank. It is also one man, one vote proposition and a little group of stockholders cannot elect directors. It takes many men, not much money to do it.

But if the blockheads get a-going as directors and wreck the whole institution and none of the 87,000 farmers who did the electing get wise to the incompetency of their representatives in time to call a halt and things go to tobogganing to "bungy", what about our farmer with $500 in the hands of the bonded representatives? Whether it be from foolishness or trickery the bonding company must make up the loss to the extent of double the amount of money handled. It is difficult to imagine a condition where that $500 could be jeopardized. The writer is no lawyer and can be trapped in legal phraseology, but it seems impossible to get a different view of this situation. It is the safest and sanest proposition going.

Let us imagine that there is some way by which that $500 can be held. The farmer loses it, how it can be done one cannot guess. Then says the extremest, he is liable for all else that he has. How so? It is provided that if he breaks his contract he forfeits ten dollars a cow for the first month. That is $200. Do you imagine that the forfeiture can be collected under the fraudulent transaction that brings the above mentioned destruction of the organization? If so, then there is a possible $3 a month more that can be collected perhaps for six months. The whole thing might amount to a thousand dollars just as though he had $500 in stock in the bank that went to pieces with nothing to collect from the wreckage. It would be serious and the wrecking of a bank would also. But it looks far less likely to happen in the case of the co-operative than in the case of a national bank, and certainly less so than in the case of a railroad or a manufacturing or mercantile business. Very little is done except to distribute the proceeds of the sale of milk although there are certain few things that the directors are expected to do in addition. Not, however, to the extent of investing or directing the whole amount of money collected. Most of the whole proposition is purely clerical.

Then we are told that this organization which we control is going about to buy or erect and equip plants all over the country and it will mean an enormous investment and will have to be paid for from the general fund. Well, if you think so, you read the dealer's propaganda closer than your own, and that is something very few men did. If you did it I am ashamed of you. Plants there will be and the more the better if necessary. When a locality wants one they go at it and raise the money just as the farmers in our town did in July, 1918. No difference there. It will be local money that procures local plants and the more of these the better for organization if they are properly placed and economically acquired.

Yes, there is one exception to this. In some locality there is need of a condensery or some other manufacturing plant in order to take care of surplus milk and provide relief for the whole membership, with a certain number of these there will be no surplus of milk on the fluid market. These are for the benefit of the whole organization and they cost heavily. In this case the local people raise what is needed for the usual sort of a plant and the general membership will help with the remainder. One cannot say just what that amount can be but for the 87,000 dairymen it is not large. A million dollars could hardly exceed three or five cents a hundred on the milk for a year. All this you get back in interest bearing certificates due within five years.

Minnesota Holstein Breeders Hold Successful Sale

The Minnesota Holstein Breeders' Second Foundation Breeders' Sale was held at the State Fair grounds October 28-29, at a time when pessimism seemed to rule the Holstein market.

In the face of such an unfavorable condition the breeders went ahead with their sale, consigned good cattle and advertised extensively. The results, 113 animals sold for a $595 average, justified their efforts. It was, we believe, the most successful sale this fall and while those same 113 head might have brought more than $67,260 a year ago, it was in the main a sale with fair prices and certainly one with very satisfied buyers.

The E. C. Schroeder consignment of 9 head averaged $1,136 with Mr. Hackney's much larger consignment, 35 animals, in second place at an $870 average. Eight head from Arden Farms sired by either "Count" or "Piebe" averaged well over $1,000.

To these same two breeders belong the honor of consigning the highest priced bull and female. Colonel Glen Ormsby, a 2-month-old son of S. P. O. M. 41st and from Glen Canary De Kol, 34-lb. cow, topped the sale at $2,600. He was consigned by the E. C. Schroeder Farms and purchased by R. M. Jenks of Wisconsin. Hurd's Princess Korndyke, a 30-lb. granddaughter of Sir Veeman Hengerveld in calf to King Segis Pontiac Count, was the highest priced female at $2,500. She was consigned by J. M. Hackney and purchased by L. J. Smith of Iowa.

Mack, Krause, and Gue did the selling with Sec. B. D. Scott in the box. The sale was under the management of the state association.

Following is a list of all animals, selling for $500 or more, and buyers of the same:

A. B. Rayburn, Minnesota	
Harriett Pauline Segis	$1,200
J. B. Irwin, Minnesota	
Segis Pontiac Johanna Ormsby	$750
Queen Piebe Korndyke Ormsby	1,325
A. T. Boutin, Wisconsin	
Netherland Homestead Johanna	$1,000
Gracia Johanna Segis of Cedarside	600
Piebe Johanna Homestead	785

Lady Elenore Pontiac	510
Sir Ormsby Akkreummer Hengerveld 2d	1,025
Emblagaard Colantha Cloverdale 2d	565
Gage & Kurtz, South Dakota	
Piebe De Kol Homestead	$700
Aaggie Wayne Pauline De Kol 2d	1,025
King Johanna Fayne Homestead	550
Harry G. Cox, Minnesota	
Eureka Segis Burton De Kol	$1,000
Eureka Segis Corabel	675
Ormsby Langtry Segis Korndyke	1,190
Ida Beets Segis Johanna	775
Sir Veeman Wayne Homestead	1,375
Jenny Wren Colantha Ormsby	1,400
H. C. Johnson, Minnesota	
Miss Johanna Ormsby Hengerveld	$800
North Star Prilly Oak	550
Reka Korndyke of Springdale	500
R. M. Jenks, Wisconsin	
Queen Homestead Pontiac Segis	$1,200
Novelty Beauty	575
Colonel Glen Ormsby	2,600
W. E. Cook, Wisconsin	
Johanna Segis Homestead	$1,100
Madison Elizabeth 2d	700
Oak De Kol Walker	705
Miss Ormsby Akkrummer Haidee	1,225
Mercedes Zora Johanna	2,000
E. T. Winship, Minnesota	
Eureka Buckeye Segis	$600
Miss Inka Ormsby Natsey	500
J. D. Salisbury, Minnesota	
King Korndyke Pontiac Lass Ina	$1,200
King Korndyke Pontiac Lass Flora	925
Jean Du Luth Farms, Minnesota	
Bonheur Posch Champion	$825
Dr. H. P. Fischer, Minnesota	
Edenvale Nellie Ormsby 2d	$1,500
L. J. Smith, Iowa	
Hurd's Princess Korndyke	$2,500
Gruel & Nolte, Indiana	
Sir Veeman Pontiac Korndyke	$2,050
B. D. Scott, Minnesota	
Sir Veeman Walker Pontiac Segis	$780
Chris. Peterson, Minnesota	
Rose Clothilde Elsie De Kol 2d	$575
Winona Tryntje De Kol 2d	510
Lilith Korndyke Walker	500
Wm. W. Swoden, Minnesota	
Lady Rhoda Korndyke Cornucopia	$800
Grahamholm Colantha Elcey Aaggie	500
J. T. Peltz, Minnesota	
Nannetto Pontiac Ormsby	$700
Lady Artis Glenna Jessie	900
Mustinka Beauty Ormsby	1,340
H. E. Bailey, Wisconsin	
Bess Ormsby	$1,300
T. H. Skrei, Minnesota	
Jenny Wren Pietertje 2d	$1,000
St. Olaf College, Minnesota	
Isabella Pietje Segis	$600
Wisconsin State Normal, Wisconsin	
Highland Pietertje Clothilde	$610
N. C. Johnson, Minnesota	
De Kol Akkrummer Ormsby	$540

Wisconsin Holstein Breeders to Meet

Wisconsin Holstein breeders are asked to meet at luncheon Nov. 26 at the Republican Hotel, Milwaukee, to discuss county sales, county activities in the future, state association memberships and activities, and the state sale. County association presidents and secretaries, sale managers, and all interested breeders should plan to be there. Luncheon reservations should be secured from the secretary's office at Madison.

L. L. OLDHAM, Sec.

Coming Events

Farmers' National Congress, November 16 to 19, at Columbus, Ohio. A. P. Sandles, Sec., Columbus, Ohio.

Dec. 9-11, 1920—International Farm Congress meets at Kansas City, Mo.

Jan. 4—6, 1921, Wisconsin Cheesemakers' Association meets in Milwaukee. Secretary, J. L. Sammis, Madison, Wis.

Dairy Clouds in Canada

HOARD'S DAIRYMAN:—When last I wrote to Hoard's Dairyman a few short weeks ago there were no clouds on the dairymen's horizon. Now there is not much of anything else. Developments here have been similar to those in the United States. In my last notes I mentioned that the Toronto producers had contracted their winter milk at $3.25 per eight gallon can (80 lbs.). The new price was already in effect when our Board of Commerce, now practically defunct, stepped in and demanded that the price revert to the August level till the Board could investigate. Through representations of the National Dairy Council of Canada, this order was withdrawn but an investigation was conducted. At the hearing the producers had the advantage of the results of a survey just completed in the territory from which the bulk of the Toronto milk supply comes. This evidence, presented by Mr. E. S. Archibald of the Ontario Milk Commission, fully justified the price asked and the Board agreed to let the producers alone till the end of the present year. The producers won a great victory through having a strong organization and dependable evidence.

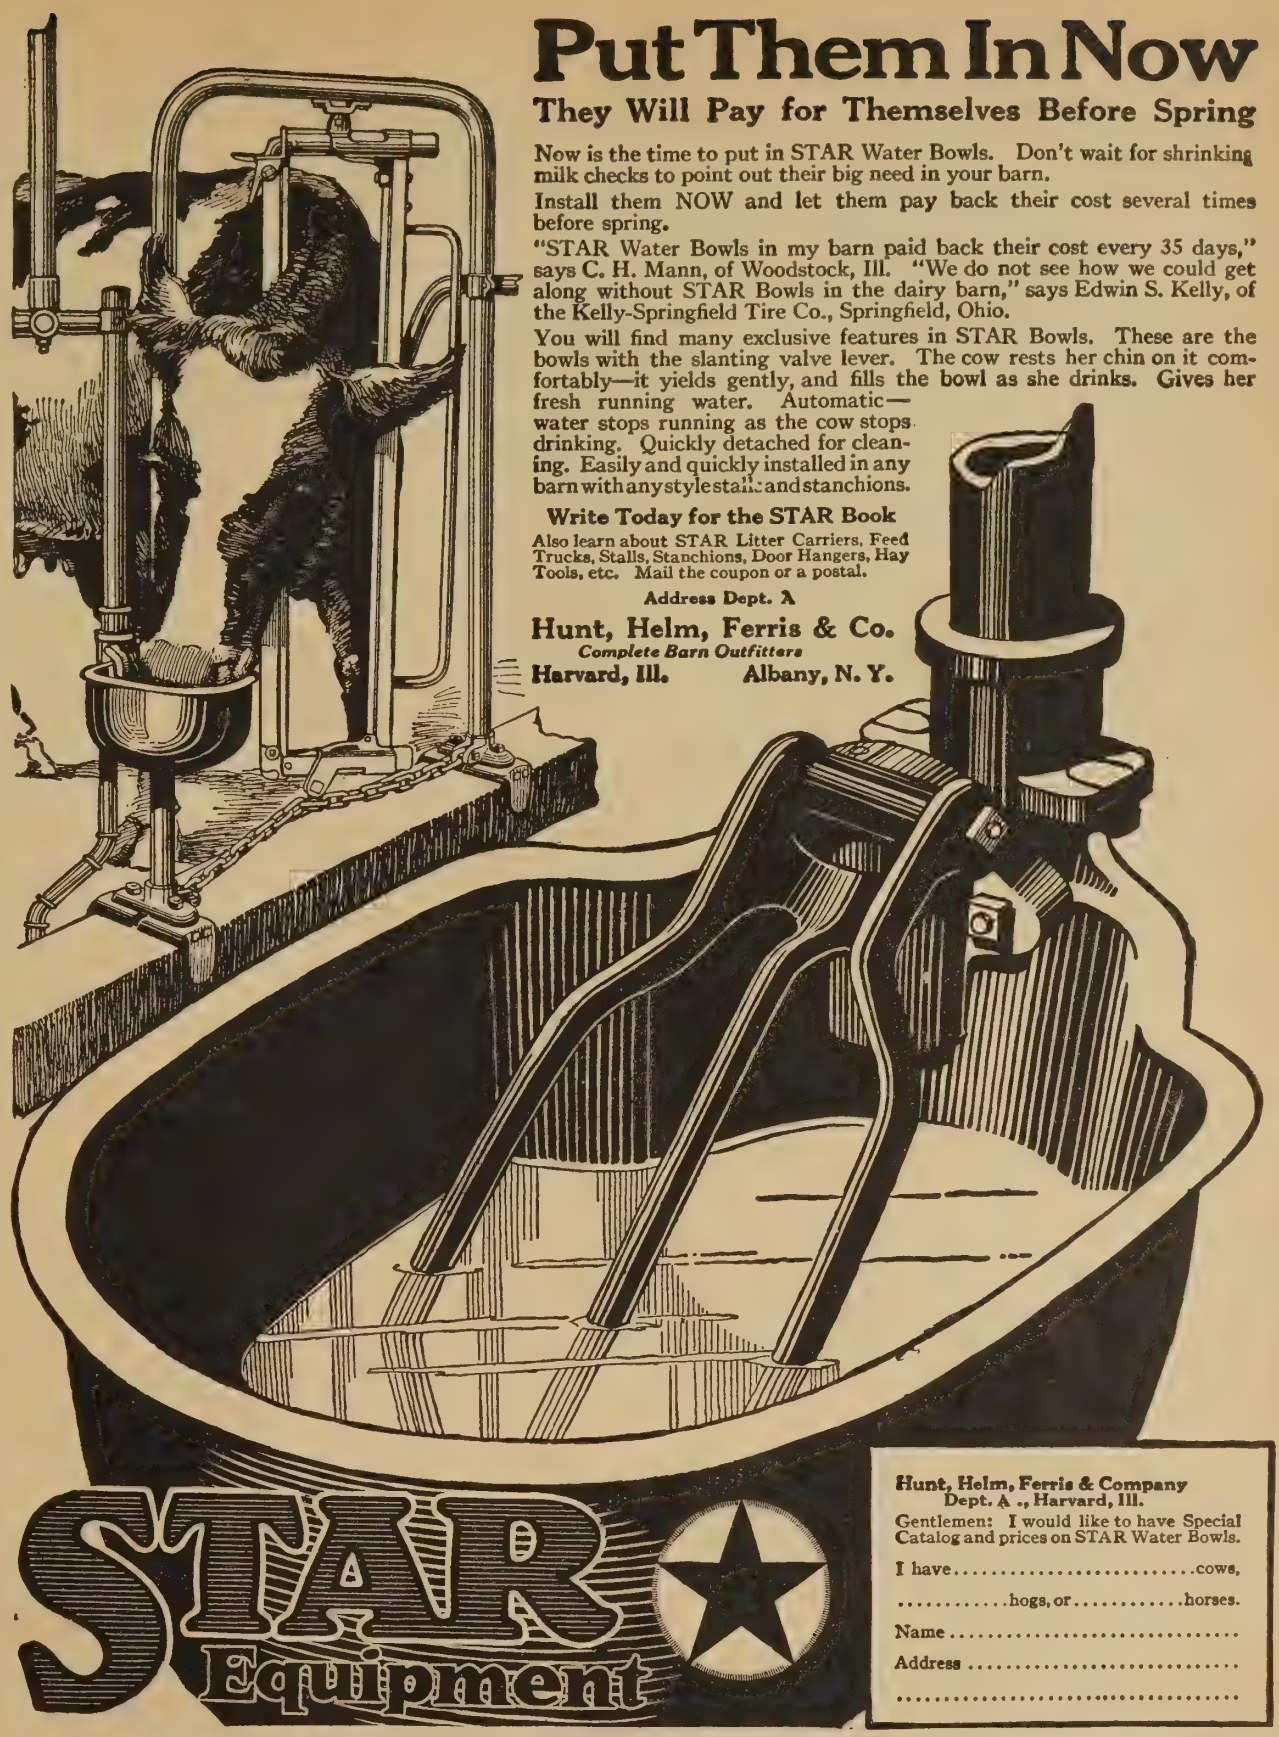
And then, like a bolt from the blue, came the announcement that the powdered milk factories in Western Ontario would not accept any more milk for powdering after September 18. This is an important industry and with just four days' notice the patrons have good cause for complaint. The company was willing to accept all milk brought to them and make it into butter at a charge of five cents a pound. During the last half of September the farmers got $2.16 per cwt. for 3.5 milk on this basis. They also got the skimmilk, but as few of these farmers have hogs the skimmilk was almost valueless to them. Following on this one large Borden condensery at Huntingdon, Quebec, closed and the other condenseries all over the country announced a decrease in output of 20 per cent. At the same time the cheese and butter markets, due to the fall in value of English exchange and weakness at New York where some of our best butter had been going, further weakened the milk market. The powder factories are located in territory that is easily reached from Toronto and this surplus of milk endangered the Toronto market.

The Toronto producers have just held a meeting (Oct. 28) and unanimously decided to reduce the price of November milk from $3.25 a can to $2.90 a can. This action will go far to convince the consuming public that the producers desire to be fair. It will also stabilize the market for a time at least. In the meantime the farmers are coming to recognize that better organization is needed and that they made a mistake in allowing their cheese factories to go out of business when the powdered milk factories and condenseries came in. The value of an alternative market in the control of the farmer himself was never so well demonstrated.

The bright side of the picture is the falling quotations on feeds. Bran has dropped $16 a ton in the month. Oats are selling around 70 cents and other home grown grains in like proportion. Corn is selling lower than for years at $1.16 on track, Toronto. The fly in the ointment for many producers is that when the city milk prices were set in August, they went ahead and laid in large supplies of feed at the prices that then prevailed. They also argue, and with justice, that winter prices for some years past have been set on a rising market and they were "in the hole" before spring. Now, when the market favors them, they feel that they should be given the advantage of it. It is questionable, however, if the market could have been sustained in view of the surplus of milk in the country. At Montreal, on the other hand, where there are no powder factories in the district, the winter producers are largely city shippers and there has been no move as yet to reduce the price.

The British Ministry of Food has cabled an offer of 47 cents a pound for best creamery butter. This is several cents below our quotations but the offer has weakened the market. Were the surplus on hand cleared away there would be an improved tone all round. In the meantime the producers are wondering what will come next. They are wondering, too, when the prices of other commodities are going to commence to decline in proportion to their own.

Ontario. F. E. ELLIS.



Anti-league Propaganda

HOARD'S DAIRYMAN:—Volumes of literature are being circulated by the New York milk dealers and advertisements are carried in local and agricultural papers at great expense. It is propaganda to prevent the securing of signatures to the pooling contracts for the co-operative association that the League has under promotion. It seems to have little direct influence on farmers. Those who read and think are little affected by it except to be annoyed and made more antagonistic to the dealers.

It has seemed to me that this is doing no real harm, but we find that indirectly it may be. Townspeople are getting the dealer's side of the matter and by talk they seem to be influencing some of our farmers. Possibly that has been the intent all along, for banks and dealers have had the same dope and some in addition. We find that some local merchants are taking up the misrepresentation by the milk dealers and spreading it among the farmers. This is unfortunate.

New York. H. H. LYON.

In studying which washing machine is best, remember that even the simplest is better than the old washboard.

Put Them In Now

They Will Pay for Themselves Before Spring

Now is the time to put in STAR Water Bowls. Don't wait for shrinking milk checks to point out their big need in your barn.

Install them NOW and let them pay back their cost several times before spring.

"STAR Water Bowls in my barn paid back their cost every 35 days," says C. H. Mann, of Woodstock, Ill. "We do not see how we could get along without STAR Bowls in the dairy barn," says Edwin S. Kelly, of the Kelly-Springfield Tire Co., Springfield, Ohio.

You will find many exclusive features in STAR Bowls. These are the bowls with the slanting valve lever. The cow rests her chin on it comfortably—it yields gently, and fills the bowl as she drinks. Gives her fresh running water. Automatic—water stops running as the cow stops drinking. Quickly detached for cleaning. Easily and quickly installed in any barn with any style stall and stanchions.

Write Today for the STAR Book

National MILKER

This teat cup fits all teats. It has only four parts and no tools are needed to take it apart.

Simple and Efficient!

THESE are the words which dairy farmers are passing from one to another about the National Milker. They are astonished at its simplicity—yet owners insist it is the most efficient milker made. Imagine a milker which has only five parts to its pulsator—which has only four parts to its teat cup—which uses only one tube from pail cover to branch connection—and which can be used either as a single or double unit by a simple turn of a faucet.

A few months ago you would have said, "Such a milker is impossible." Now, thousands of dairy farmers *know it is* possible. They have seen the National Milker—have tested it themselves—have learned a new standard of simplicity and efficiency in a milking machine.

You Should Investigate

You need maximum simplicity in your milking machine. The elimination of unnecessary parts in the National Milker means new ease of operation, economy of upkeep, longer life. It means more satisfactory service day after day, year in and year out, no matter who operates it—whether it's your hired man or young son.

Isn't this the kind of milker you want? Other dairy farmers are saying, "Yes," to this question as soon as they see the National Milker. How about you?

The National Milker is the sensation of the dairy world. Isn't this worth investigating? Where's your pencil? Write and ask us about it—now!

National Milker Company

Uncle Sam's Hired Men Who Serve You

(Continued from page 737)

ter serving on the general staff abroad.

Greeley's work was performed with distinction, and for it France made him a chevalier of the Legion of Honor, and England awarded him the Distinguished Service Order. After a little more than two years in the army, Greeley returned to take charge of the branch of forest management in the Forest Service, and with the resignation of Colonel Graves as forester in April, 1920, was appointed to succeed him.

Greeley's Duties

The national forests contain 154,658,373 acres of government-owned land and are for the most part in the Rocky Mountains and in the far western states, but there are two in Arkansas, two in Minnesota, one in Florida, and one in Michigan, and a number are being created through land purchases in the White Mountains and Southern Appalachians. One of the things in which Colonel Greeley is deeply interested is to make the recreational features of these forests better known and fully available to the people generally, though, of course, the proper utilization of their timber, ranges, water power, and other material resources bulks larger from a business standpoint. Another task is keeping down the fire losses—heroic work which each summer puts the whole organization, from chief forester to the last ranger and forest guard, to its greatest test.

It is also the duty of the Forest Service to make sure that the grazing facilities of the forests are properly utilized. Today the forests furnish range for approximately 2,375,000 cattle and horses and 8,500,000 sheep and goats. Then, too, there are the watersheds for some 1,200 cities and towns which lie largely or wholly within the national forests and which must be guarded against contamination or despoilation. A further duty is that of scientific research to find out how to make better use of all our forests and of the timber and other forest products which they yield.

Appalling Timber Consumption

Even more important, in many respects, is the timber business of the forests. The total saw timber stand on these tracts is estimated at 500 billion board feet, and the yearly cut for all purposes is over 800 million board feet. As the ripe timber is harvested new growth takes its place, and if protected from fire will in due time furnish another harvest. But this is not true of our privately owned forests. The cut of government owned timber is trifling in comparison with the average annual cut and loss, estimated at 26 billion cubic feet, for the entire country.

This condition justifies the utmost concern on the part of all whose interests will be affected by timber scarcity, and that means the whole nation. Only one-fifth of our original virgin forest area is left in this country, while on all our forest lands, private and public, we are growing less than one-fourth the amount of timber annually consumed.

"I want to make the national forests of greater national service," is the way Colonel Greeley sums up his task. "I have seen how these great tracts can serve both material and recreational needs, and I want to raise this service to the maximum. At the same time we propose in every way possible to bring home to the people the need for a sane conservation policy with respect to private forests, for if the nation fails to call a halt on forest devastation, it will pay a terrible price!"

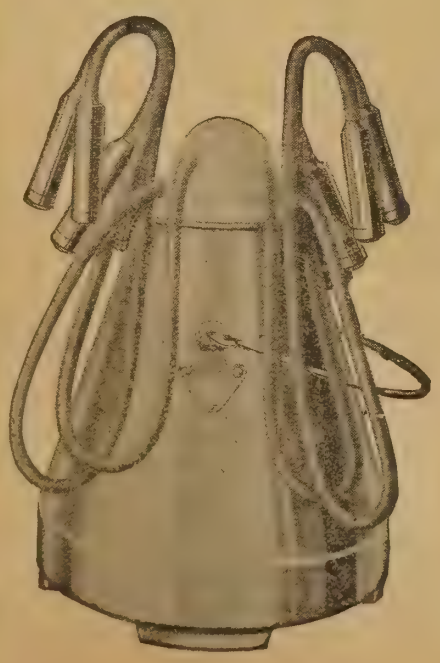
Ayrshire Advanced Registry

During the past quarter year one hundred and eighteen Ayrshire Advanced Registry records have been completed averaging 10,779 lbs. milk, 432.01 lbs. fat. Forty-six of these are by mature cows and average 11,897 lbs. milk, 472.72 lbs. fat.

The highest record is that of 21,123 lbs. milk, 741.91 lbs. fat, completed by Voca 5th of Avon owned by W. P. Schanck of New York. In the Roll of Honor Division 15 cows and heifers completed 300-day records of 9,964 lbs. milk, 404.92 lbs. fat. Athalee of Pataskala, owned by W. A. Stalter of Ohio, led this class with 13,470 lbs. milk, 561.12 lbs. fat.

Uncle Ab says: "I always try to keep my work in front of me; when it gets behind and begins to push me, it gets me worried."

MILK



Increasing In Favor As a Beverage

Men are patronizing the soda fountains in increasing numbers since prohibition went into effect. Their preference, in many instances, is for milk.

This greater demand for milk spells greater "opportunity" for the dairyman—absolute assurance that the market will take every quart he produces.

Dairymen, awake to their own interests, are increasing their herds and adding milking machines to their equipment.

The milking machine enables one person to milk three times as many cows as he can milk by hand. Milking machines that assure the highest grade of milk are equipped with

WEAR-EVER ALUMINUM TRADE MARK

The ear for the bail on the "Wear-Ever" Pail is so constructed that the bail cannot possibly fall flat against the side of the pail. As a result the bail is always held about an inch away from the side insuring a quick and easy grip.

They Step Across the County Line

A. J. CRAMER, WISCONSIN

ON October 1 and 2, 1920, a group of thirty-five dairymen representing the Avoca, Barneveld, and Dodgeville Cow Testing Associations in Iowa County, Wisconsin, made an auto tour through Green County. The purpose of the tour was to learn what members in the Monticello Cow Testing Association are doing in the way of care, feeding, and management of their dairy cattle and farms.

The Baltz Hoesley Holstein Farm was first visited, where Professor G. C. Humphrey of the College of Agriculture conducted a dairy cow judging demonstration. Each visitor made his choice of three animals from the group of seven cows. Professor Humphrey then chose the three outstanding individuals in the group giving his reasons for making the choice. Mr. Harold Schindel, field secretary for the Green County Holstein-Friesian Breeders' Association, led the way to the Stauffacker Bros. Holstein Farm, their herd numbering 75 milking cows, the largest milking herd in the Monticello Association. The milk truck on this farm hauls on an average of a ton of milk to the condensery each day.

The largest Brown Swiss herd in the Middle West, owned by Jake Voegli & Sons, was an interesting sight. Mr. Jake Voegli, Sr., explained what kindness means in a dairy herd. Each animal could be approached and handled out in the open pasture.

On the Pierce Bros. farm we saw the Holstein bull that won the grand champion prize at the Green County Fair this fall. The largest Holstein cow in Green County, weighing 1,700 pounds, was on exhibit at the Fred Marty farm. The largest number of A. R. O. cows on any single farm in the county is owned by Roscoe Smith who told how he began his first official testing last winter. We were escourted by Mrs. Ezra Blumer through her modernly furnished farm home. At this farm we saw a number of uniformly marked calves.

After leaving this farm, we drove to Monroe where a banquet supper was served at one of the leading hotels. Mr. Schindel acted as toastmaster with brief talks by Professor Humphrey; Phil Hudson, the Avoca Banker; Harry Noble, Iowa County's new county agent; and A. J. Cramer, supervisor of cow testing associations.

On Saturday morning we visited the Marty and Gempler combination cheese factory and creamery where several thousand tons of cheese were in storage. An ideal type of show cow was seen on the Herman Gempler Farm. Mr. Henry Barbler showed us his $20,000 Holstein sire. Mr. Fred Schoete favored us by showing his herd of 140 head of Ayrshires, fifty of which were placed on auction sale a few days later.

Following this, we visited the lime demonstration plots on the Green County Farm. Here, Professor L. F. Graber, an alfalfa authority, explained the needs of a soil before alfalfa can be successfully grown on it. An acre field for the first cutting showed a ton more of alfalfa harvested on limed soil as compared with the unlimed plot. After lunch, the visitors started for Iowa County feeling that the visit was well worth their time, and that Green County can no longer be classed as one of the three places where the Babcock is not known, but instead it is growing to be one of the leading dairy cattle counties in the state.

A GROUP OF ENTHUSIASTIC IOWA COUNTY, WISCONSIN, DAIRYMEN VISITING GREEN COUNTY

Current Feed and Hay Prices

Feed and hay prices did not recoup during the week ending October 30, despite the cold weather. The reduction of the differential between flour and wheat for export from 25c to 5c per hundred lbs. caused the re-opening of Nebraska mills, and this with other conditions indicates a large supply of mill feeds.

Quotations on bran are: $30 in Minneapolis, $33 in Chicago, $29 in Kansas City, $39 in Atlanta, and $40 in Baltimore, Philadelphia, and New York. Middlings range from $29 in Minneapolis to $40 in New York.

Cottonseed meal (41 per cent) is quoted at $43 in St. Louis, $47 in Chicago, $48 in Minneapolis and Philadelphia. The 36 per cent meal carries a quotation of $2 to $4 under these prices.

Northeastern markets continue to quote linseed meal at $50 f. o. b. mill. While prices of other feeds have declined 40 to 66% within the last five months, linseed meal has shown a decline of only 18%. Quotations are: $54 in Minneapolis, $56 in Chicago, $60 in St. Louis, and $54 in New York.

Prices of gluten feed at the principal markets range from $42 to $44. Hominy feed declined to $32 in St. Louis, with Chicago quoting $34 and Philadelphia, $41. Domestic beet pulp is quoted unchanged at $52 in northeastern markets, with $41 at Los Angeles, $44 at Chicago, and $48 at Minneapolis.

San Francisco quotes alfalfa meal at $38, rice bran at $36, and cocoanut meal at $30. Brewers dried grains are offered at $45 in Milwaukee.

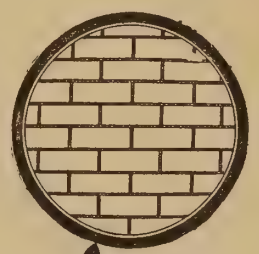
Reports of the hay market show practically no change from last week. The market is dull and receipts are light. Trend of prices on timothy are generally lower, although some markets showed advances due to light receipts. No. 1 timothy is quoted as follows: $23 in Minneapolis, $31 in Chicago, $35 in Atlanta, $33 in Philadelphia, and $40 in New York. Mixed timothy and clover is from $2 to $6 lower in price, with straight clover about the same.

Alfalfa advanced a dollar a ton in the more important markets, but this was largely due to light receipts. No. 1 alfalfa is quoted at $26 in Kansas City, $22 in Omaha, $30 in Chicago, and $33 in Atlanta.

Hunziker Revises Book

"Condensed Milk and Milk Powder," which has been the standard work on this topic for several years, has just been revised and brought up to date by its author, Professor O. F. Hunziker. Individuals interested in the manufacture of these products or who desire to secure information on them will find this book of the greatest service. The name of the author is in itself sufficient guarantee of its value, and a perusal of the book bears out his reputation as a scientist and practical manufacturing specialist.

The revised edition, the third to be published, represents an entirely new book that contains all that the other contained and much recent information on such subjects as: new methods for cooling and sterilizing, viscosity tests, and further details on the manufacture of powdered milk by different processes. Old processes of manufacture have been modified or superseded, improved equipment has been invented, and the industry has undergone an important evolution.



Hoard's Dairyman commends this book to those interested in the subject and will be pleased to supply it upon receipt of its regular price, $5.75.

Pea Growers Busy

At the meeting of pea growers held by the Dodge County, Wisconsin, Farm Bureau at Juneau, Oct. 23rd, it was decided to send a committee of five representative growers to represent the interests of Dodge County farmers at the statewide meeting of pea growers to be held at Madison by the Wisconsin Farm Bureau Federation and the Division of Markets, in the near future. The selection of this committee is to be made by the Dodge County Farm Bureau which will finance the delegation. The growers present, about one hundred strong, from every township in the county, went on record as favoring a State Pea Growers' Association.

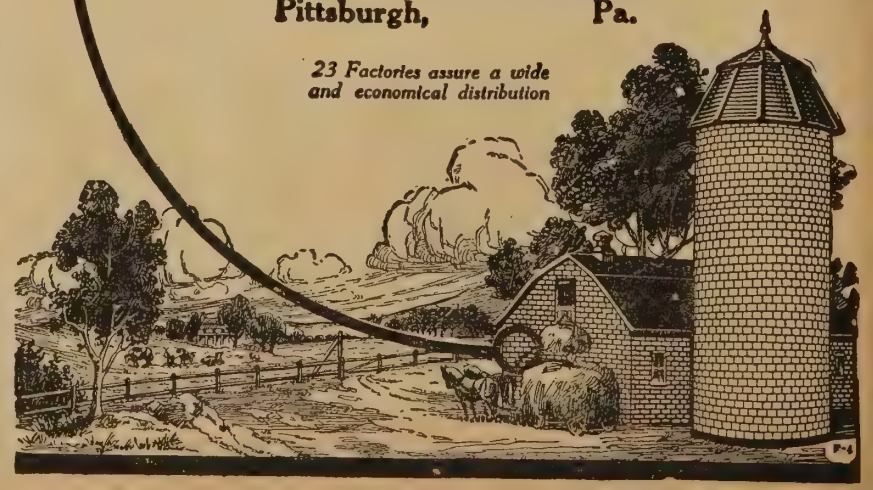
Much dissatisfaction was apparent among the growers present, particularly as to prices paid, and grading, time of cutting, quality of seed furnished, and other provisions of the contract, which is drawn in such a way as to protect the canning companies, and letting the growers assume all risks.—Dodge County Farm Bureau.

How Does Your Dairy Score?

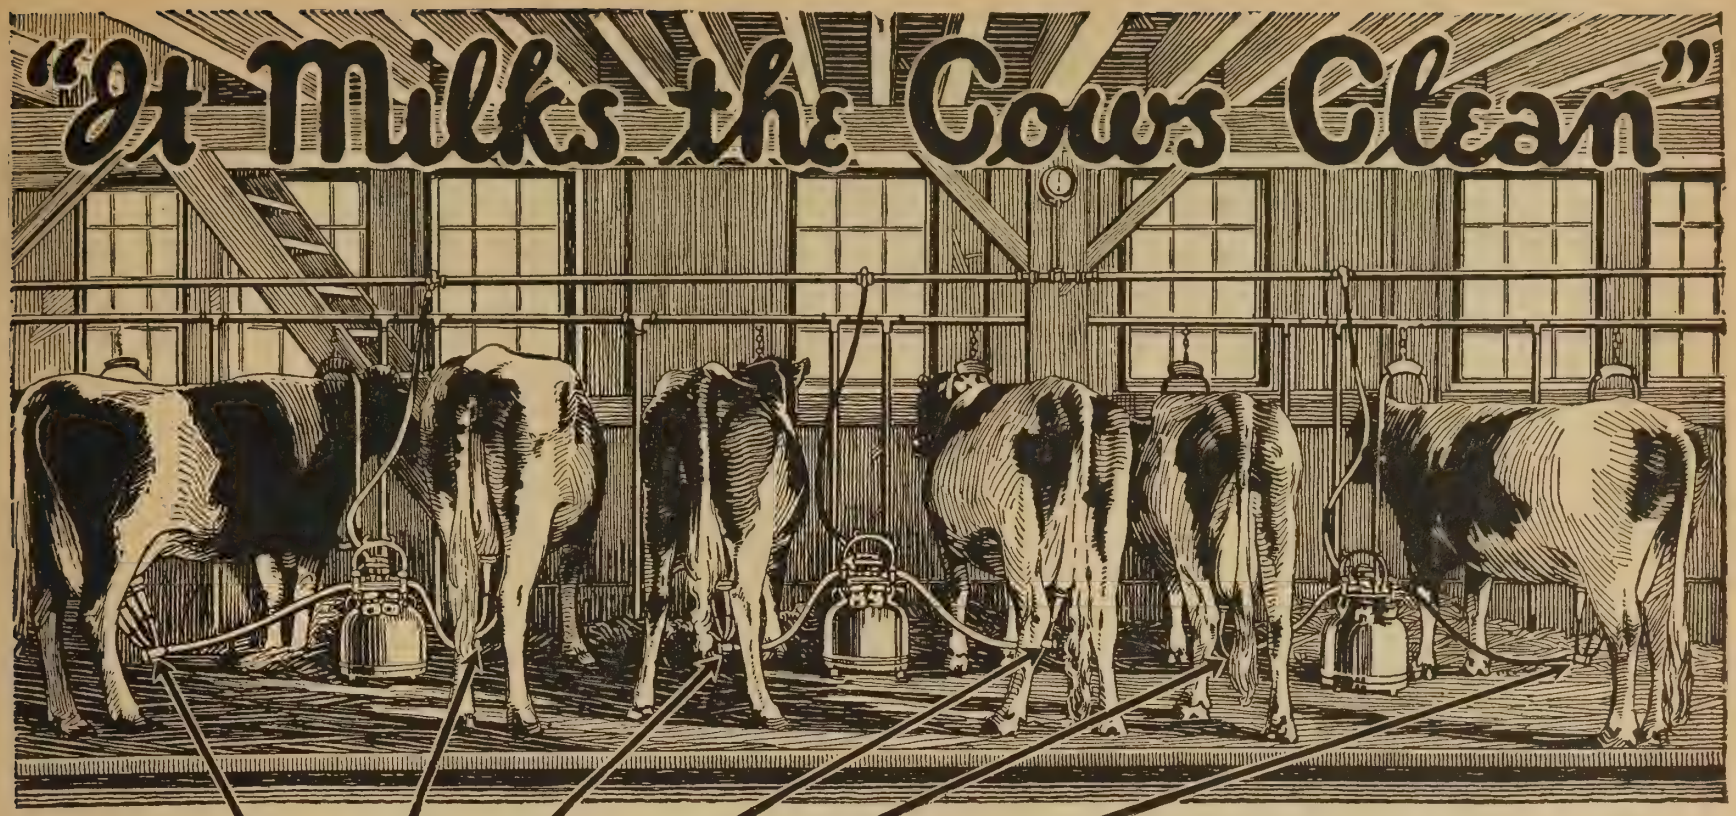
Smooth glazed inner wall of Natco Dairy Barn — strictly sanitary

DOES your dairy get a score to be proud of when the inspector calls at your farm? Do you get those *extra* profits awarded for strictly sanitary milk? You *can* get them if your barn is built right—built with

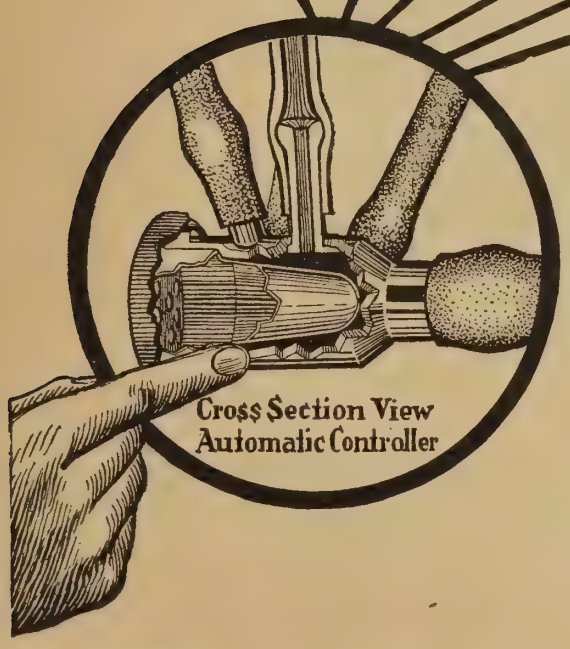
Natco Hollow Tile



The smooth glazed surface is as easy to keep clean as the household crockery. Germs and vermin find no place to hide; foul odors and filth cannot penetrate. It is easy to produce clean, wholesome milk in Natco Dairy Barns and Milk Houses.



Natco buildings are economical. Once up, they stand for generations, never needing paint and seldom any repairs. First cost is *last* cost.



Ask your building supply dealer to figure with you on buildings of Natco Hollow Tile. Write us for free book of suggestions, "Natco on the Farm."

Hard and Easy Milkers Are All the Same to the Burrell

THE Burrell Milker maintains a definite relation between the amount of milk flowing and the amount of suction in the teat cups. With any easy milker or during the main part of the milking, when the milk is flowing freely, the amount of suction is automatically decreased. With a hard milker or at the end of the milking, when milk is flowing less freely, the amount of suction is automatically increased.

The Burrell Automatic Controller is an exclusive Burrell feature. It adapts the strength of the vacuum suck to the needs of the individual cow. By means of its constant air relief, the Automatic Controller regulates the vacuum suck so that when milk is flowing freely there is less suck on the teat and when milk is flowing less freely there is more suck on the teat.

This feature of the Burrell explains why "*It Milks the Cows Clean.*" There are many other advantages which you should know about — among them the Burrell Universal Teat Cup, the Burrell Positive Relief Pulsator, and the Burrell Moisture Trap. All are exclusive Burrell features.

Write today for complete information about the Burrell Milker. Tell us how many cows you have and why you are not already milking by machine. Use the coupon below.

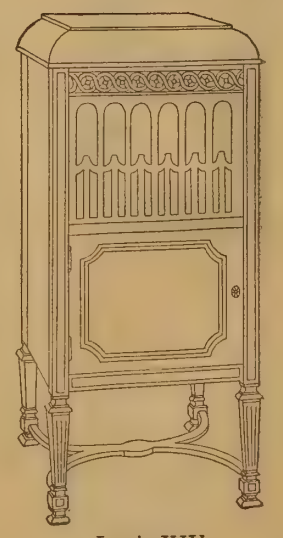
Furniture Making in the days of Queen Elizabeth

Out of the golden

THE search led back across the Atlantic, into the manor-houses of England, the chateaux of France, and the castles of Italy. Here they came to light—the true originals of the period-furniture styles. And Mr. Edison's designers adapted seventeen of these masterpieces for the modern American home.

* * * * * *



Sheraton

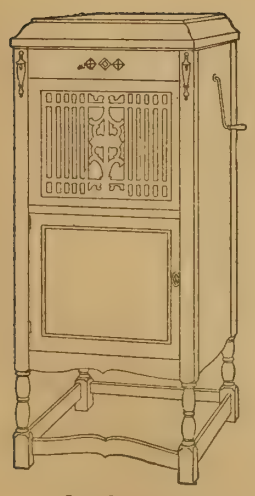
PERIOD FURNITURE is a heritage of the 16th, 17th, and 18th Centuries. The Georges reigned in England, and the Louis ruled in France.

Fine living was the ideal of the day. Men of artistic genius were lionized by fair ladies, and made wealthy through the lavish patronage of kings. Architects conjured up monumental palaces. Landscape artists set them in fairy grounds. Painters illumined their walls with imperishable canvases. Unparalleled designers and craftsmen furnished their interiors.

This era of luxury produced Chippendale, Sheraton, and other masters of the English, French and Italian schools. It brought the cabinet-maker's art to its most exquisite development. It was aptly named "THE GOLDEN AGE OF FURNITURE."

TWO CENTURIES later came a momentous development in music.

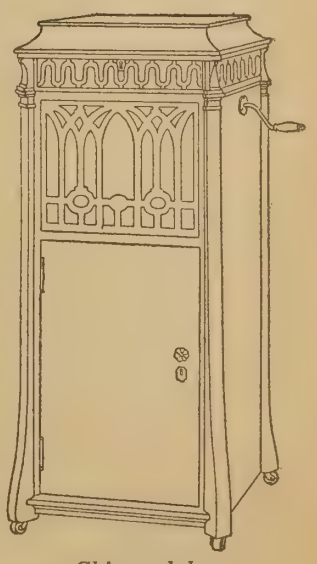
Louis XIV



The NEW EDISON *in 17 period cabinets*

The Elizabethan Cabinet adapted by Mr. Edison

age of furniture



EDISON, the thinker, conceived the vision of an America, whose every home would be blessed with great music,—through a phonograph of SUPREME REALISM. Edison, the inventor, gave three millions of his money and seven years of his time to an exhaustive research—out of which the New Edison was finally evolved. Then commenced those startling tests, by which he proved, through direct comparison, that the New Edison RE-CREATES an artist's performance exactly as the artist himself gives it. More than 4,000 such tests were made with over fifty vocalists and instrumentalists. More than four million people heard them. No one was able to tell the living performance from its RE-CREATION by the New Edison.

Jacobean

THE FAMILY that has an ear for the finer things in music is the family that has an eye for the finer things in furniture. Mr. Edison decided that Edison Cabinets should be patterned after the most exquisite furniture the world has known.

And so the search led back across the Atlantic, into the manor-houses of England, the chateaux of France, and the castles of Italy. Mr. Edison's designers made every Edison Cabinet a period cabinet out of the Golden Age of Furniture.

Beef Your Poor Cows Now

Your good cows have been paying the keep of your boarders long enough.

Beef the boarders. Your reduced herd, fed Unicorn, can produce as much as the whole herd did before.

At less cost for feed and roughage.

When your cows freshen, start right by feeding Unicorn. They will maintain a maximum production for a longer lactation period than ever before.

Traverse City (Mich.) State Hospital herd of 78 milking cows, fed Unicorn, averaged 13,669 lbs. during 1919

Good cows, fed Unicorn, always make a profit.

CHAPIN & COMPANY
Chicago

Farmers Disagree at Conference

The second session of the farmers' conference on prices and credits was held on Thursday and Friday last. A committee report was adopted recommending the immediate revival of the War Finance Corporation, the withholding of crops from markets until prices recovered to give producers cost of production, the appointment of committees to urge Congress to probe the banking and credit system, and pass amendments to the Federal Reserve system to legalize classification, long time, and low rates for agricultural loans, and another committee to include representatives of consumers' leagues and labor unions to recommend better and more direct marketing methods. Prior to adjournment the chairman, Charles S. Barrett, issued a statement urging farmers everywhere to hold crops until prices would pay costs of production, and this feature of the meeting was featured in all the newspapers.

The meeting, however, was not unanimous, as Ben S. Marsh, who appeared at the first session accompanied by representatives of several union labor organizations, objected to the action taken and asked that the session unite with union labor in an appeal to the president for the immediate extension of government credits, and for the immediate return of railroads to government operation, for he said that the big payments from the treasury to the railroads was the cause of the credit shortage. Marsh represents the National Farmers' Council.

T. C. Atkeson, representing the National Grange, also withdrew from the conference after declining to sit with the committee after the first day's session and refusing to sign the committee report. Later he issued a statement in which he stated that their diagnosis of the trouble was wrong, and hence their remedies were wrong. "Lack of credits", said this statement, "is not the cause of the present trouble, but a part of a result, and does not lie near the cause. The present price readjustment is an inevitable result of conditions due to war. What should be done," he continued, "is to seek to prevent if humanly possible the long period of depression such as followed the Civil War. This can not be accomplished by creating credits to hold products back from consumption while other products are being grown. It can be done, if at all, only by increasing consumption." The only suggestion made by the conference which he approved was to use every possible government agency to develop new markets for American farm products.—Special Report to Hoard's Dairyman.

Butter Recovers Sharply From Recent Slump

(Report by U. S Bureau of Markets)

The steadier tone and rather sharp price reaction which occurred late the previous week in the butter market developed into a full recovery during the week ending October 30. For a day or two immediately following the reaction there was some uncertainty, because after such a severe decline and weak market as has marked the past several weeks it always takes buyers some little time to regain confidence. Once the trend of the market became evident active buying developed.

Of course undergrade stocks had accumulated and at first the firmness was confined almost entirely to top grades, but later in the week the very low prices prevailing on undergrades attracted attention and the improvement was general on practically all scores. Very poor undergrades may still be bought cheaply enough, and even 89 to 90 score butter may be had for less money than it cost before the decline.

Advances Opposed

There was some opposition to the advance because the retail dealers had just lowered their prices and a more lasting improvement in consumptive trade would have been the result if prices had remained at a lower level for some time. However, the fact that jobbers, wholesale grocers, and retailers had permitted their stocks to become low brought about such a demand for butter that it was impossible to keep the markets in check. Chicago especially cleaned up very well. While prices were at their lowest a good many large holdings of both storage and fresh butter changed hands at prices representing heavy losses to the sellers. Some of this butter was picked up by speculators who hope to make a turn on the advance. This is still a factor to be considered on the market.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending October 30, 1290, and corresponding week last year, were as follows:

	Week ending October 30 1920	1919
	cents	cents
New York	60.3	69.6
Chicago	58.6	65.5
Philadelphia	60.1	69.3
Boston	57.7	67.0
San Francisco	53.5	62.5

The receipts of butter at these markets were 7,062,005 lbs. as compared with 8,096,560 for the corresponding week last year and 7,681,167 lbs. for last week.

Butter Prices For October

From the daily quotations of the U. S. Bureau of Markets, we have compiled the following table giving the monthly averages of the daily wholesale prices for October, 1920 and 1919, on 92 score butter (extras) in the four principal markets, together with the total receipts of butter at these markets:

	Av. price Oct. 1920	Oct. 1919	Receipts Oct. 1920	Oct. 1919
	cents	cents	tubs	tubs
Chicago	57.19	64.11	152,222	143,444
New York	60.38	67.54	161,055	216,218
Boston	59.08	64.46	58,293	51,297
Philadelphia	59.76	67.66	50,284	45,494
Total			421,854	456,453

That other factors than the supply of butter are responsible for lower prices is indicated by the fact that the receipts at these markets for October are nearly five thousand tubs less than for October last year. This conclusion is further reinforced by the fact that for the first ten months of this year the total receipts of butter at these same markets were a million tubs less than during the corresponding period of last year. This is a decrease of over 15 per cent, while the storage holdings are 10 per cent less now than a year ago. Indeed, the decrease in receipts at just these four markets is greater than the combined total of the exports of butter for 1919 and the imports of butter so far during the present year.

Ninety score butter averaged 51.42 cents for October on the Chicago market, with centralized butter at this market selling for 51.59 cents. Jobber's prices on extras sold to retailers during October averaged 58.73 cents in Chicago and 63.2 cents in New York.

It is still advisable to preach the gospel of the clean plate. The wasteful helping boosts the cost of living.

Holstein Campaign in New England

New England conservatism is an obsolete term as far as furthering their own interests is concerned. The campaign for the employment of a field secretary to represent New England Holstein interests began at Bellows Falls, Vt., and Brattleboro, on October 20th. A total of eighteen meetings has been held up to November 1st, covering Vermont and New Hampshire and completing these states. The quotas for these sections were easily reached, the breeders everywhere showing the same enthusiasm for the cause as in the West. Many of the meetings were held in inclement weather and often followed a day or so after farm bureau organization campaigns. Nevertheless practically a one hundred per cent membership was obtained at every meeting.

The work of organizing the New England group as a unit is being done under the direction of the Extension Service of the National Association. The breeders are being awakened to their opportunities. As a unit New England stands third in the number of Holstein cattle owned and in the number of members belonging to the National Association, being exceeded only by Wisconsin and New York. They are convinced that organization will help to increase the value of their surplus pure-breds and grades in the same manner that it has benefited the states now organized.

The grade men are showing as much enthusiasm as the pure-bred men. They feel that a field secretary will give them necessary help in getting on a pure-bred basis and assisting in other ways.

The Maine campaign opened with a meeting at Norway and Auburn, November 4th and will close after ten meetings in the state, at Houlton, November 13th. This will leave only Connecticut, Massachusetts, and Rhode Island.—Fred A. Koenig, Holstein-Friesian Association of America.

Illinois Holsteins Sell Well in Lake County Sale

The Lake County (Ill.) Holstein Association Sale at Libertyville, October 18th, went over in very good shape. The consignments were well selected and showed a good deal of quality. All of the female stuff was taken readily and at very fair prices. The 40 head of females in the sale averaged $404. In this number were five senior heifer calves, averaging $261 per head, nine yearling heifers averaging $357 per head, and eleven two-year-old heifers averaging $534.50 per head. The 52 head sold were selected from eighteen herds and they went on sale to twenty different buyers, there being only three of the consignors whose names appear in the list of buyers. One of the very satisfactory features of the sale was the fact that there were several men who were starting into the pure-bred business in Lake County at this sale.

Among the largest buyers of the sale were St. Mary's Training School, Mr. A. S. Benson (Gagemere Farm), Lloyd Ritzenthaler, William H. Peterson, Frank Siljestrom, and Cleveland and Holmes, all of Illinois.

The bull calves, it might be said, probably did not bring their full value, selling for the most part from $100 to $200 per head, but the breeders seemed to be supplied with herd bulls and these nice young calves were taken by dairymen. The prices on the bulls might have been affected by the fact that only two days prior to the sale, Lake County breeders had just held a bull sale for the benefit of local dairymen at which some 32 head were sold, these being young bull calves.

Mrs. Green Manages Texas Jersey Sale

HOARD'S DAIRYMAN:—Mrs. J. Riley Green of Texas, secretary of the Texas Jersey Cattle Club, managed and conducted the pure-bred Jersey sale which was held at Dallas while the Texas State Fair was in progress there the latter part of October. Mrs. Green, together with her husband who is in the live stock business, owns a herd of Jersey cattle numbering between 75 and 100 head on what she has named the Red Roof Stock Farm. At the auction sale there were 57 head of Jerseys sold, netting an average of $362 each. The highest price paid for any one animal was $1,300 paid by Brown Bros., to McDonald & Brown for Sultana's Lady Oxford. The second highest price paid was $575.

All of the animals handled through the sale were pure-bred, registered Jerseys, selected and passed upon by a special committee. The cattle were consigned by nineteen of the best Jersey breeders in Texas, each consignor being a member of the Texas Jersey Cattle Club. Every detail of the sale was handled entirely by Mrs. Green. She engaged the auctioneer, Colonel D. L. Perry of Ohio, and employed all other assistants.

Texas. W. D. HORNADAY.

Cheese Prices For October

October showed a decline of nearly 2 cents in the price of cheese on the Wisconsin boards and in Chicago, with the New York market showing no loss. For the ten months ending October 31 the total receipts of American cheese at Chicago, New York, Boston, and Philadelphia amounted to 134,202,411 lbs. as compared with 160,589,261 lbs. during the corresponding ten months of 1919. This represents a decrease in receipts of over 26 million pounds less than last year, the month of October increasing the amount of decrease by six million pounds. Thus far, at least, cheese receipts have not been increased by condenseries turning to the manufacture of cheese. The cold storage holdings at the markets mentioned are also eight million pounds less than at this time last year.

The daily quotations of the U. S. Bureau of Markets show the following average quotations on cheese (style Twins) for three large markets in October, 1920 and 1919:

	Average price October 1920	October 1919
	Cents	Cents
Wisconsin Boards	24.62	28.86
Chicago	24.36	29.00
New York	27.20	30.50

Longhorns averaged 25.39 cents on the Wisconsin boards for October as compared with 27.64 cents for September.

WISCONSIN VITEX DAIRY FEED

Feed 4-All to live stock other than dairy cows. Keeps horses in condition and fattens meat animals at low cost.

GRAIN rations cost too much. Besides they don't give your dairy cows enough protein to secure high milk production.

Vitex Dairy Feed is a scientific combination of wholesome milk producing ingredients, oil meals and glutens. It is 24% protein and contains the correct proportions of fat, fibre and carbohydrates to keep your cows in prime condition and make them heavy milkers.

Vitex is all feed and no waste. Every dollar of its cost comes back to you many times over in the milk check. You can gauge your feeding accurately as our special mixing process makes every sack uniform. This uniformity permits the use of Vitex with mixed herds.

Ask your dealer for Vitex and 4-All. If he does not handle them, write us.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Broadening Out

[Continued]

Jimmy demonstrated to Bob's satisfaction that one drink of moonshine could not put him under. The car crept along slowly over the rough places and sped along where the roads were at all good with all the life that any Ford can muster. But to Bob, his driving was not without criticism. So cautiously at one time did he approach what appeared to be a bad stretch of mud, that he found by the time he was well into it, the car was fast losing its power. And there they were, stuck quite fast.

"Now you just keep your shirt on," he commanded Bob, "until I size up the situation and, besides, you'd better not get out in that mud until you have to. I think I can make her go through by backing out of it and then plunge her through on a full head of steam. It's not so bad if you've got plenty of power."

But it was not so easy getting out of it, in fact following repeated attempts he gave it up as a bad job. Again he went forward, but only to stop, and he found that the more he tried, the deeper the car was digging itself in. "Well, there's one comfort, old kid," he said to Bob. "We won't have to spend any time digging her grave; she's doing that about as fast as she can with the life she has left. You might just as well laugh with me, Bob, and agree that this has been our Jonah day."

"Listen," said Bob, "isn't somebody coming? Thought I heard talking."

"Guess you did," he answered, looking out of the back window of the car. "Looks like help, too, he added somewhat relieved. "I'll bet they heard us speeding the motor and guessed we were in trouble. Any way they're coming our way and we'll ask them to give us a lift. They look big enough to lift the whole thing right out and set it down on dry land."

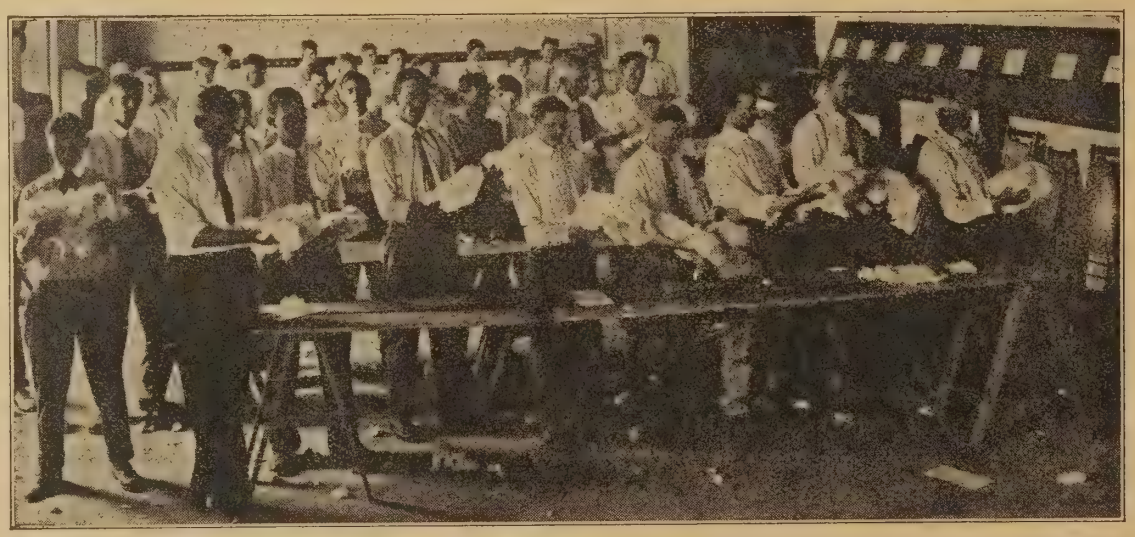
" 'Smattah, boys?" inquired the first of the group of four as he stepped up and peered in at them. "Stuck?"

"Oh, no," responded Jimmy quickly. "Just out looking for a place to bury this ornery Liz. She's acting like your southern mules. Thinks she's done a day's work and it's time to quit."

"Well, we don't want her dead ca'cass 'round here," he haw-hawed, "so I guess 'sup to us to give you a running start out of this territory. Come on, boys, give them a lift."

"What you fellahs doing up here in these diggin's anyway?" asked another of the group. "Yeh hain't some of them gov-ment gents looking for moonshiners, be yeh?"

"I should say not," laughed Jimmy outright. "If I knew you had some of that stuff, I'd just ask for a friendly drink," he said diplomatically.



"Naw," said the first to speak, "they're all right, just didn't know any bettah than to land in this Gawd-forsaken place; that's all."

"Set off the motah, boys, so's to give us a show and you'll be out of here in less time than it took you to get in," said the fourth one of the group who had maintained a steady silence up to this time. "I've helped put more than one mule where he didn't want to go," he boasted with simple pride.

"Allow us to thank you before we start," said Bob, "because we may be so far away when we stop again that we won't have the chance to."

"Don't mind the thanks, Buddy," came from the last to speak. "We're only doing it 'cause we know it's the right thing to do; the Good Book says so." And as the big quartette put their shoulders against the quaking Lizzie, the boys found themselves moving slowly out of their predicament and, with Jimmy feeding the gas, it is safe to guess that they soon landed high and dry, nor did they make a stop until the sight of a cross road store convinced Jimmy that it was about time to feed his face.

"Got anything fit to eat?" he asked the lifeless proprietor, as the two dashed across the worn threshold.

BOB AND JIMMY WERE INTERESTED IN OTHER AGRICULTURAL SCHOOLS. HERE IS A CLASS THEY VISITED WHICH IS LEARNING TO JUDGE COTTON

"Mebbe," drawled the answer. "Whatcha all want?"

"All," said Jimmy, looking about for enough to make what he would call all. "There's only us two," he returned, "if that's what you mean."

"Exactly what I mean," he replied. "Guess you two be Yanks, eh? Not 'customed to our talk; 'sthat the idee?"

"Oh, we understand well enough to get along pretty well," Jimmy sarcastically replied, "and we always knew that we were a real pair, but this is the first time we've had the compliment paid us by someone else," he joked. "How about the eats?" he inquired further.

"Sa'dines, gingah snaps, crackahs, and baked poak and beans; that's the lot. Sound good enough?"

"Jiminy crickets, yes," snapped Jimmy. "Anything'll do; a slice off that old razor back out there 'll do if you think there's that much on her," he said, as he pointed to a much starved hog wobbling about the front of the store. "Where's the pork in these beans?" he asked as the opened can was shoved in front of him. "I thought you said baked pork and beans," as he shoved his finger to the bottom of the can. "No pork here, 'cepting this," as he drew forth one piece of hog skin, holding it by the few black hairs which someone had forgotten to remove. "Seems that beans and pork would be a more appropriate way of referring to this hash," placing emphasis on the bean part, he ended dryly.

"Are we headed in the right direction to get to Guntersville?" he asked of the crowd of Saturday afternoon loafers who were hanging about the car. All tried to answer at once, with the result that the boys had things pretty well laid out, at least for the remainder of that day's trip.

"What's the W stand fur on that liscence number?" asked a little, wizzened up old man with a Yankee accent.

"Wisconsin," quickly returned Bob.

"What'd I tell yer?" said the little old man to the rest of the crowd. "I knowed that W couldn't stand fur Washin'ton and Wyoming, too." Then, turning to the boys, he said: "Great state, that Wisconsin. I cum from thar, too."

"Yes, and she's getting greater each year," boasted Jimmy. "Say, Mr.," he addressed the little old man, "why didn't you stay in a good place when you were once there?"

" 'Cause the girl I married cum frum the South, but, by cracky, if I had it to do over again," and here he halted. "Well, the truth is, sonny, she just got hum-sick for the old place, and here I've been ever since; never got enough together to take us back again," his eyes dimming with tears he tried to hide.

"Nice, hospitable lot," Jimmy remarked to Bob when they had got beyond hearing distance of the crowd. "But I'd like it better if they showed more life; they act as if they were too near the grave to suit me."

"Don't be so critical, Red," answered Bob. "They are mighty fine and it's just their way of acting like that. It's a safe guess that it's a golden rule to allow for other people's peculiarities. And, besides, you musn't think that these old mountaineers are typical of the southern people."

They finally reached Guntersville and after making sure of the way to Gadsden they proceeded with all the speed they dared to travel with. They reached Gadsden safely that night, and from now on they began to count the days when they would arrive in Thomasville, Ga., the place they had selected through the advice of those who ought to know, as the one place in a progressive agricultural section. The one thing for which they were thankful while travelling through Georgia was the improvement in the highways compared to those in Alabama which they had passed over. For those who have never been in Georgia, it would be difficult to attempt a description of certain conditions which would be appreciated. One travels through miles of territory where the soil is so ed that it looks as though the surface of the roads had been painted. When dry they are smooth and hard, but when wet they couldn't be more slippery if they were smeared with grease. And the boys found both kinds, but, notwithstanding that, they made good time and on Sunday night they pulled into Atlanta, the Chicago of the South.

"No, sir," said the policeman to Jimmy. "You've come to a mighty poor town for Sunday amusements. No picture shows and theaters open here on Sundays. We don't make many laws down here, but them we do make, we enforce. Better go to church, boys, 'twill do you more real good, anyway."

"Nothing doing, Bob," said Jimmy as he turned to where he had left him while he went to ask the policeman about amusements. And after relating the conversation he had had, he ended by saying, "Let's take his advice, Bob. I liked the way he talked. At least it sounded good coming from him. It kind a gives one a little more respect for those fellows." It was not a difficult matter to persuade Bob to go to church and so the two went to the First Presbyterian church where they listened to a scathing sermon on the liquor question.

"What did you think of it?" asked Bob as they were returning to the hotel. "Aren't you sorry that you broke your record when you took that little snit of moonshine?"

"Not a bit, Mr. Perfect Man," Jimmy answered. "It didn't hurt me and now I know what's meant when they talk about moonshine. I'm the kind of a guy who will try anything once," he added with his usual amount of Irish bluster. "Besides, we only learn by doing and so I'm at least one point wiser than you right now. I've found out that I don't like liquor from this one experience, so that's the end as well as the beginning, and I don't think you stand any higher in the opinion of the Almighty right now than I do. So there you are; that's the way I feel about what doesn't happen to be your business, anyway."

"You've squelched me, Red, so there'll be no argument on that question tonight," said Bob good naturedly.

"I guess a day and a half from now will land us in Thomasville," remarked Bob as he studied the map the next morning, "and I'll not be sorry, either, will you?"

"No, I won't be sorry," answered Jimmy, "but on the whole it has been lots of fun in spite of the trouble we have had. Anyway, it's lots pleasant-

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. _____ State _____ R.—

er than pitching manure all day, and that's what I'd be doing if I were at home right now," he added with satisfaction. "Poor old Jerry, I know that's what he's doing. I'll never forget the wistful look on that kid's face, Bob, the morning you and I pulled out of the yard and the grip he gave my hand when he said good-bye. He envied me so much. I could have just cried outright and I guess I would if I had been a girl," and Bob noticed him trying to slyly get rid of the tear which at that moment had fallen upon his freckled cheek.

"If there ever was a faithful boy lived on this old earth," he continued, "Jerry's that boy. It makes me ashamed of myself every time I think of him. Always unselfish and always on the job. Takes after my mother's side of the family. Surely isn't a Greene, for they are all homely like me and selfish as the very old d———. You bet I'll see that he has his inning when I get through college. They say that nothing's too good for the Irish. And that's true for the Irish like Jerry. Wish I had his looks. Oh, there I go again," he caught himself, "looking at the selfish side of things. But I know it must be difficult for people to look at me."

"You mustn't under-estimate your worth, Red," interrupted Bob. "You are both good fellows, and I agree with you that Jerry is one boy in a hundred who would put up with what he has to. But, never mind, things will turn out all right for him, too. The unexpected has happened for you, and I think between the two of us, we will fix things for Jerry's future, too."

"This is getting interesting," said Jimmy as he viewed the landscape on either side of the road. "Suppose these are the pine forests of Georgia, from which we get all of the Georgia pine lumber. Think of it, Bob, here we are right in the midst of the very place from which the lumber came that we used in our house for finishing. Funny how things do get distributed about since man decided to work with Nature.

And the pine forests to which Jimmy referred are beautiful. These forests are places where one sees Nature at its best. Acres of giant pines, straight as an arrow without a branch to mar their straightness and stretching their feathery heads toward the heavens as if to breathe the purest of the atmosphere. It would almost seem that Nature has been too lavish with some things, so much so that man no longer appreciates her beauties as such, but only turns his attention to them to seek some financial return. This is certainly the case here. The majority of these fine forests have suffered underneath the swing of the axe and the cut of the saw, until now there remains nothing but the second growth of timber and underbrush, both of which go to make the rural sections forlorn and lonesome looking. But, no doubt, the day is not far distant when this must all give way to fine farms, just as the hard wood forests of the North have done.

"Paint on the farm buildings down here is about as scarce as hen's teeth," remarked Jimmy. "I should think that they would pep up a little and fix things so that they would look as if someone lived in them."

"Don't forget, Red, that a lot of this land is owned by the niggers, and they are a shiftless lot. Maybe they are not to blame, either, when one stops to think that they are not very far removed from the wilds of Africa as far as time is concerned. This will all change some day, though, with the great interest that is being attached to agricultural development all over the country."

"There's one thing, Bob, about which I am disappointed, and that is the corn fields that we have seen so far. The best field that I have seen wouldn't compare with what you and your dad used to laugh about on our farm before dad paid attention to better methods in growing corn, after I taught him how as a result of being in the corn acre contest that year as a club member. I thought we'd find corn at its best down here where they have such a long growing season with plenty of rain and where they can grow the large varieties. I can't understand why they plant so many beans with the corn," he said expecting that Bob could offer some explanation.

"Those are velvet beans, Red, and they grow them with the corn for fodder, I suppose. But they must have a job when they go to harvesting them. Surely they can't use a corn binder in that tangled mass of stuff. Well, maybe we'll find out why they do this when we inquire into it. But one thing I believe now that we have always heard about the soil down here. These corn crops are proof enough. The soil is so worn from growing cotton year after year, that a great deal of it is no longer productive. This, together with the ignorance about suitable crop rotations and the lack of farm stock to provide manure, has brought this condition about."

"Look out for that razorback, Bob," called Jimmy reaching for the wheel. But it was too late. The car ran over it, leaving it struggling in the road. "I'm sorry," said Bob, "but I guess the poor thing didn't have strength enough to get out of the way."

"Or maybe it wanted to commit suicide," chuckled Jimmy. "Stop, Bob; I think we have a flat tire. I'll bet the razor in the back of that hog did it. I thought surely we had one," he added as they climbed back after finding all tires full. "Any way it might have happened," he said.

"Look at that one with the three sticks fastened about its neck. Who ever heard of putting a polk on a hog! Suppose they figure that with that outfit around the neck, it will make a hog think that there are fences where they really don't exist. They couldn't go very far, anyway; they're too weak for that. Bob, these must be the real razorbacks that we heard about in our animal husbandry class last year. Guess they come about as near to being like a wild hog as anything that walks on four legs today. Strange that people can't see the folly of spending time on raising such scrub stuff."

"We'll learn all about them when we get to Thomasville," Bob answered, "and a lot of other things, too. I am pretty well impressed with the possibilities this country shows up, Jim, to tell you the honest truth. Why, here we are," he exclaimed in astonishment, "right on the edge of Thomasville, now," and Jimmy started to hum, "How Dry I Am".

[To be continued]

Junior Letter

Hoard's Dairyman Juniors:—I received my fob, creed, and button and was much pleased with them.

This is my first letter to the juniors.

My father has taken the Hoard's Dairyman for almost two years. I always read the junior letters and like the stories of Jim Greene and Bob Ramsay.

We live on a farm of 160 acres. All of it is under cultivation. We have two silos on the farm. I think silos are a good thing to have.

I am thirteen years old and in the eighth grade at school. Our teacher's name is Miss Noble.

I have a brother. He is nine years old. We have a Shetland pony and a grade Durham calf. We each own a yearling heifer which are twins and each own an old pig and young one.

We are all through threshing and are filling silos here today. We will finish tomorrow.

If any of the juniors want to write to me my address is R. R. 1, Plainview, Minn.

Lloyd Melendy.

Does Mrs. Housewife Demand Your Butter?

She is the judge of butter value. *She knows* sweet, clean butter must be protected from dirt, dust and bad odors.

A middle-aged, single man wants position as foreman on a dairy farm, or as herdsman. Have no bad habits. Address BOX 448, care Hoard's Dairyman.

Wanted—Management dairy farm or estate warranting salary $3,000. Ample experience, ability, references. Address BOX 455, care Hoard's Dairyman.

Price Readjustments Expected on Cheese Markets

Reaction Follows Recent Declines—More Confident Feeling in Evidence—Growing Demand for Held Cheese

[Report by U. S. Bureau of Markets.]

The unsettled condition of cheese markets as revealed by trading during the past month gave way to a much stronger feeling during the week ending October 30. Business was on a more confident basis, and while price advances did not follow the reaction, an early recovery which will readjust values is generally anticipated. Country markets in Wisconsin opened with prices reduced in line with lower costs, and offerings of dealers showed a considerable range, based upon individual ideas of what turn the market was likely to take. Toward the middle of the week trading began to take on a firmer tone and dealers who had quoted low prices found it difficult in some cases to handle all orders on account of having oversold their stocks. This situation, together with a generally firm feeling and more active demand, has caused many dealers to look for slightly higher prices than have prevailed recently.

Confidence in Distributing Markets

Reports from distributing centers beat out this idea, as markets, especially at Chicago, ruled steady to firm following the early-in-the-week declines. After being adjusted somewhat to the country markets basis, prices asked generally held firm and were easily obtained. The tendency of buyers was to shop the market, but they were looking for goods. Although on the whole the amount of trading between dealers locally was far below normal, a fair volume of business was transacted, especially on styles which happened to be greatest in demand. The bulk of the sales were for small-sized lots and were mostly from out-of-town buyers. A great many hurry-up orders were received from jobbers and retailers who had allowed their stocks to get low on the falling market and who began to buy as soon as bottom prices seemed to have been reached. The continued talk regarding heavier receipts later on from districts where condenseries have recently closed is still causing dealers in eastern markets to hold off in their purchases of new cheese. The condensed milk market is in a weak condition and the possibility of condensing being resumed in the immediate future is not a probability. Large quantities of milk, however, are going into butter instead of cheese.

Interest in held cheese grows each week, partly because of seasonal demands, but more largely because of the facts that the quality of new cheese is none too dependable and that jobbers have been using their storage stocks the past few weeks and have accustomed their trade to cheese of this type. As a matter of fact, the proportion of really fine cheese is comparatively small and many dealers have expressed a great deal of confidence in cheese markets during the coming months for this reason. In their opinion the only cheese which it will be unprofitable to handle is that of questionable quality which even now does not share fully in the firmer condition of the markets. Export trade is slow as prices offered are still too low to result in orders being filled.

The average wholesale prices on American cheese (style Twins) for the week ending October 30, 1920, and for the corresponding week last year, were as follows:

	Week ending October 30 1920	1919
	Cents	Cents
New York	27.5	31.7
Chicago	23.4	30.9
Boston	26.4	32.7
San Francisco	23.6	30.7
Wisconsin	23.3	30.9

The total receipts of American cheese at these markets were 2,570,001 lbs. as compared with 4,332,687 lbs. for the corresponding week last year and 3,025,667 lbs. for last week.

Alabama Alfalfa Land

Demopolis Section

We offer natural advantages equal to any section of the country for dairying. We have located dairymen here from 24 states. Some of the richest blood of all breeds of dairy cattle can be found in our section.

Our local creamery ships nearly a quarter million dollars' worth of butter annually and is paying Elgin prices for products. In addition there are many dairies shipping whole milk to the larger cities. The industry is growing so rapidly that cooling stations are being installed at central points.

Our entire section is Tick free, we have overflowing wells and plenty of cheap labor. Our soil is rich in lime, phosphorus and potash and is enhancing in value rapidly. Due to favored climate our native grasses furnish grazing for 10 months and when supplemented with clovers that grow wild and alfalfa there are 12 months grazing. Summer silos and soiling of crops are not needed here. Drop us a card for photographs and literature descriptive of this section.

"You Save Money"
says the Good Judge

And get more genuine chewing satisfaction, when you use this class of tobacco.

This is because the full, rich, real tobacco taste lasts so long, you don't need a fresh chew nearly as often.

And a small chew gives more real satisfaction than a big chew of the ordinary kind ever did.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Pyometra

The word pyo prefixed to another word or term means pus. Pyometra means an accumulation of pus in the uterus (womb). Take as other examples, pyorrhea, a discharge of pus from the sockets of the teeth; pyothorax, a collection of pus in the chest cavity, more commonly called empyemia. Another term which should be understood in this connection is pyemia, meaning infection by pus germs causing abscess formation. A good illustration is, pyemic arthritis, or abscesses containing pus and characteristic of navel and joint disease of calves, foals, and other young animals.

Pyometra is preceded by infection from germ invasion and usually follows retention of the placental membrane, or secundine, commonly called the afterbirth or "cleanings". In acute cases the cow may be thriftless, thin, and listless; in most cases there is no apparent disturbance of health. A discharge from the vagina usually is seen, but it may be scant. In other cases it is profuse purulent (pus containing) and may show slight blood-staining or have a foul odor. The latter conditions are common shortly after calving and retention of the afterbirth. At such times, too, the discharge contains particles of decomposing tissue of the retained membranes. The affected cow does not, as a rule, come in heat, but there are exceptional cases where periods occur, but the cow fails to conceive when bred.

The trained specialist can determine correctly and positively the presence of pus by handling (manipulating) the womb through the walls of the rectum. It takes experience and fine sense of touch to differentiate between the pregnant condition and presence of pus. This determination must perfectly be made before treatment dare be given. Interference with the womb is about certain to cause abortion, if pregnancy happens to be present. There are several indications which enable the specialist to correctly determine pregnancy. Non-experts should let the womb alone, but may give vaginal injections if an abnormal discharge is seen.

When pyometra has been diagnosed the veterinarian proceeds to drain the pus from the womb by means of a rubber catheter. He does not consider it safe to use a metal return-flow catheter, as the walls of the affected womb may have been rendered so soft or friable as to be readily punctured. Should that accident occur the cow will be about certain to die of septic peritonitis. The rubber catheter is also worked into the horns of the uterus to draw off pus, the veterinarian meanwhile manipulating the womb by way of the rectum to facilitate the process. Flushing out by means of the catheter is done with normal salt solution. Strong antiseptic solutions are harmful and some of them may cause poisoning by absorption. The cleansing is done once a week, and antiseptic solutions may be used as normal conditions of the womb result. If taken in time treatment may so restore normal conditions that the cow conceives when bred. Chronic cases usually prove incurable, so far as barrenness is concerned.

Worms

Please advise what to give a horse for intestinal worms.
Sanquoit, N. Y. A. E. M.

Mix together two parts of table salt and one part each, by weight, of flowers of sulphur and dried sulphate of iron (powdered copperas) and of this mix one tablespoonful in dampened feed night and morning for a week; then stop for 10 days and then give the powders for another week. Omit iron for a pregnant mare and increase sulphur. Colts take less doses in accordance with age and size. The medicine kills the worms and they are digested, so do not look for them in the feces.

Swelling

Not long since I noticed an enlargement just in front of the udder of one of my cows. Upon examination I found it to be quite soft and from what I have read I am quite certain the bunch is caused by rupture. It is now about six inches in diameter, but causes the cow no inconvenience. She will freshen about Nov. 10th. Is there any remedy for this condition?
Muscoda, Wis. B. E. S.

If a rupture is present you will find it possible to work the bowel back into the abdominal cavity by manipulating the mass with the fingers. If that can be done strips of porus plaster or surgeon's tape should be placed upon the part, layer on layer, to build a strong truss; then pass a bandage around the body and fasten it to the truss by means of pitch. This may help, until the cow calves; then an operation will be in order, if that is thought worth while by the veterinarian. We suspect, however, that a dropsical swelling may be present and that should subside if the cow is made to take exercise, is less heavily fed, and the part is well massaged two or three times daily.

The Disciplined Life

There is widely advocated in the world today a doctrine of relaxed endeavor. It places the enjoyment of life very high—I think too high. It sets enjoyment as the goal of our desires. In this, I am sure that it is wrong. It is not given to men and women to make enjoyment their goal. Furthermore, it teaches that the good things are ours of right, that we may take them and enjoy them, without the hardy effort of acqusition and without the virtue of deserving. You will find this doctrine taught everywhere today—in the novel, in the drama, in social reform, in political revolution. With all the conviction that I possess I warn you from it. In its place I urge upon you the Doctrine of the Disciplined Life, the hope of rewards fairly and arduously won, the necessity of sacrifice. There are no darlings of fortune.—DAVID P. BARROWS, President University of California.

Tom's New Suit

(Continued from page 737)

come," continued the doctor. "The colored man was, perhaps, clean and respectable. Finally he wore the suit out completely. One day a ragman came along calling, 'rags, rags, any rags, highest price for old rags.' Well, that ragman bought that suit as old rags, paying a few cents for it. He threw the clothes into his rickety old wagon among all kinds of filthy rags and rubbish, and next we see the cloth ground up with other woolen rags from everywhere. All were ground up together, and from the mixture your new suit is made."

"My new suit made of old rags," mused Tom.

"Yes," returned the doctor, "but the materials were put through a process that killed all the germs and then the materials were scoured until they were supposed to be clean. As a physician, I think I can affirm that such cloth is usually free from disease germs and actual filth, but as a man who knows something of the clothing business, I can also affirm that such cloth sells on the market today for much more than it is worth."

"I should say it does," remarked Tom, who was thinking of the $50.

"Then," continued the doctor, "it offers the best opportunity possible for profiteering in clothing. You paid $50 for a shoddy suit. It is made of rags worth, after they are scoured, about twenty cents a pound. The twenty-cent woolen rags are mixed with a little wool worth $1.50 a pound and the cloth is made into a suit that sells to you for $50. Why, you ought to be able to get a new woolen suit fresh from the backs of healthy sheep for less than that."

"Well, what can we do about it?" asked Tom. "Most of us don't know cloth as you do. It looks to me as though we would have to keep on paying for new wool and get nothing but shoddy clothes in return for our hard earned cash."

"Not necessarily," answered the doctor, "there is a way out if we will all get busy and see to it that Congress passes the French-Capper Truth-in-fabric Bill. That bill would require manufacturers to stamp in the selvage the various kinds of materials that enter into the composition of the cloth. When the truth-in-fabric bill is passed and the law rigidly enforced, shoddy cloth will not sell as readily as it does today. That bill should be followed by another bill that will require that all ready made clothing shall carry a label telling exactly what it is made of.

The truth-in-fabric bill and the correct-label bill should be passed at once. These bills should be actively supported by the purchasing public, and they should have the active backing of wool growers everywhere. If you and I and everybody else will pull for the passage of these bills, Congress will take action now. If we take no interest, the bills may fail, and we will then keep on buying new suits that are all wool and all shoddy."

"Well," answered Tom, "I will write to my congressman urging him to vote and to vote for the passage of these bills."

"That's right, Tom," replied the doctor. "We must act at once or the wool growers will be ruined and then no new wool will be produced. The wool growers cannot compete with the ragman as long as the fraudulent article sells for the genuine. Therefore, in fairness to the wool growers, in fairness to ourselves, and in the interests of right and justice, we should urge every congressman and every senator to support bills that will make cheating in the quality of clothes next to impossible."

The Healthy Cow, the Hungry Cow is the Business Cow

She's the cow that will convert her feed of grain and fodder into pails of milk.

Remember, the better the appetite, the greater the food consumption, the greater the milk production. Hence, good health, a strong appetite and good digestion are the absolute essentials of a big milker.

Dr. Hess Stock Tonic

Keeps cows healthy. It makes cows hungry.

It contains Nux Vomica, that greatest of all nerve tonics. It whets the appetite, brightens the eye, invigorates the system. It contains Quassia, that bitter Stomachic tonic that produces appetite. It contains Iron that helps to replenish rich red blood, so essential to a cow in milk.

Lastly, but just as important is it—it contains Laxatives and Diuretics that cause the kidneys to filtrate and the bowels to operate regularly, so as to throw off and carry off the waste material. There is no clogging of the system where Dr. Hess Stock Tonic is fed.

Good alike for cattle, horses, hogs and sheep. It keeps animals healthy, the whole herd thrifty. It expels worms. Always condition your cows for calving with a course of Dr. Hess Stock Tonic before freshing.

Dr. Hess Stock Tonic is compounded strictly on scientific lines. You buy it according to the size of your herd. Tell your dealer how many cows you have. He has a package to suit. We guarantee good results in the milk pail.

25 lb. Pail, $2.50 **100 lb. Drum, $8.50**

Except in the far West, South and Canada. Smaller packages in proportion.

FAIRBANKS SCALES

Never before so essential as today

THERE WAS NEVER A TIME when you have had a greater need of a wagon and stock scale than today.

The high price of feed makes it even more essential that your stock should bring the best possible returns.

Because of the high prices of live stock you *must* watch carefully the weights of your animals. You also must know their weights when you take them to market.

To be absolutely sure that your weights are correct you should weigh your feed and stock on a dependable scale. The Fairbanks Scale for Wagon and Stock use has been the world's standard for 90 years and today fixes the standard of weight in any neighborhood.

In these times of high prices a dependable Fairbanks Scale often is the deciding factor between profit and loss in farming.

Hog Cholera Fakery

There are always certain men who seek to profit through calamity and among these are the vendors of certain hog cholera "cures". These cures are not only of no value, but the men who handle them will discourage some farmers who might otherwise protect their herds by the use of hog cholera serum and virus. Certain sections of Wisconsin are having an outbreak of the disease and the following warning from the Wisconsin Department of Agriculture applies to other states as well as Wisconsin:

"Don't put your faith in irresponsible vendors of hog remedies. Accept the assurance of all responsible authorities and of all progressive experienced swine breeders, that there is no cure for hog cholera, and that there is no preventive for it except hog cholera serum, properly prepared and properly administered.

"The department is informed that agents for hog remedies are working in infected territories and that they have made the following statements:

"1. That it is not advisable to vaccinate against hog cholera because it lasts only 60 days.

"2. That it spreads hog cholera.

"3. That feeding their remedy will prevent cholera.

"4. That they are representatives of the state veterinarian and will work free. All you need to pay for is the remedy.

"5. We are also told that they are carrying around specimens which are believed to have died in that territory from hog cholera.

"Dr. Purcell, in charge of the work for the department, advises hog raisers to accept the assurance of the Wisconsin College of Agriculture, of the U. S. Bureau of Animal Industry, of the Wisconsin Department of Agriculture, and of every progressive hog breeder in the country who has had experience with hog cholera that there is no truth in any of the above first four statements.

"Also that it is advisable and necessary to vaccinate against hog cholera, and that vaccination lasts during the life of the animal.

"It does not spread hog cholera.

"Hogs of any weight, age, or condition, and upon any kind of feed or tonic will contract hog cholera if exposed to this infection unless they have been immunized by the administering of hog cholera serum. Therefore the claim that stock food or tonics will protect against it is false."

Illinois H.-F. Association Officers

The third annual meeting of the Illinois Holstein-Friesian Association was held October 12. The business transacted included the report of the treasurer. Amendments were made to the constitution, adapting it better to meet the rapidly developing condition of the association. The state was divided into five districts, on the basis of cow population, and one vice-president and three directors were elected from each district, who should constitute a committee for the district.

The officers elected for the ensuing year were: President, George A. Fox; secretary-treasurer, R. N. Thompson.

Arrangements were begun to make the next state sale, about March 10 and 11, 1921, a better one than the last. In competition with Chicago, the cities of Aurora, Wheaton, Dixon, and Sterling have formally entered bids for the next sale.

Illinois. R. N. THOMPSON.

The Scotch have a proverb that good feeding is necessary for milk production. They say "it is by the head the cow gives milk".

SWINE

Hitch Your Wagon to a Star

Tie Your Herd to the Proven Success of
Epochal Berkshires

Get a Herd Sire or a Foundation Trio

From the herd that has won more first prizes and more championships at the biggest shows this year than all its competitors put together.

Some statement, but it's true!

The Epochal Herd won 62 firsts out of a possible 106 and 23 championships out of a possible 42 at the 1920 Missouri, Illinois, Iowa, Indiana, and New York State Fairs, the Eastern States Exposition at Springfield, Mass., and the National Swine Show.

The Epochal herd won in 1919 and 1920, 429 prizes; 140 firsts, 44 championships, and 14 grand championships. This is more prizes, more firsts, more championships, and more grand championships than were ever before won in two consecutive years by any one Berkshire herd in the world.

Young boars that are herd sire prospects of the kind that lift strains to the top, $200 each and up. Trios of six months old pigs carefully and properly mated—a real foundation—$300 to $2,500.

The services of our experts will start your herd "right"; and will save you years of time in achieving success in your breeding operations. Write us. You will like the way we help you!

Epochal Berkshires are the deepest and smoothest big-type hogs.

Leaves Aid in Garden Fertility

Leaves are valuable for increasing the humus and plant food content of garden soil, according to the department of soils at the Ohio Experiment Station.

To burn leaves results in the loss of nitrogen, the most expensive fertilizing element, whereas garden soil could be much improved through the application of the leaves, particularly where it is impossible to get stable manure for garden use.

Where it is possible to secure leaves by the wagon-load from city streets the addition of acid phosphate further increases the value of leaves as a fertilizer.

Leaves serve their best purpose when piled on the garden in the fall and worked into the ground with spring plowing or spading.—Weekly Press Bulletin, Ohio Experiment Station.

Cedar Crest Farms
Offer Jersey Bull

A fine individual, Nation's Raleigh, (185639), dropped August 14th, 1919. His grandsire Imp. Hauteville Fairy Boy (90952) had twenty daughters in Register of Merit, his dam, Nation (256031) entered Register of Merit at seven years, producing 8,850.7 lbs. milk, 503.64 lbs. butterfat. Also a few first class Jersey cows.

J. K. Dering, Owner, Lake Villa, Ill.

For Better Jerseys

We do not retain in our herd any cow which under favorable conditions will not produce 500 lbs. of butterfat (600 lbs. butter) in 1 yr. on official test.

We have a few young bulls for sale.

THORNBURY FARM
LIBERTYVILLE, ILLINOIS

W. A. BREWERTON, Owner L. A. BENT, Mgr.

JERSEYS

The Sure Bulls

THERE are more Jersey bulls owned by co-operative bull clubs than all other breeds combined.

Why?

Because Jersey *cows* have completed more yearly Register of Merit records than all other breeds combined. These *fair* tests, based on a full milking period, give the breeder and farmer a wider and safer choice in selecting bulls out of proven stock.

Because for two centuries, on the Island of Jersey and in America, the world's greatest breeders of cattle have worked to make Jerseys the best and surest reproducers.

Because Jersey bulls save you many years in building a profitable dairy herd.

The Jersey Information Bureau will be glad to send you the facts about Jersey bulls—how they breed true to type and increase production. Address

The American Jersey Cattle Club
324-E West 23rd St., New York

An Institution for the Benefit of Every Jersey Owner

MERIDALE JERSEYS

Interested Prince 2d 95708

Sire of 27 Register of Merit cows, including Interested Jap's Santa, 15,569 lbs. milk, 1,007 lbs. 85% butter.

His pedigree blends the blood of those conspicuously prepotent cows, Interest and Sayda.

He has 50% the same blood as five Gold Medal cows in the Meridale Herd. A few of his sons are for sale, out of excellent Register of Merit cows.

AYER & McKINNEY
300 Chestnut Street, Philadelphia, Pa.

158 R. O. M. records made by
AYREDALE JERSEY COWS

Average 10,503.6 lbs. milk, 582.5 lbs. fat.

We offer bulls and bull calves from these cows, sired by

CARRY-ON of AYREDALE (164012). His dam and two grandams average 17,151.2 lbs. milk, 928.4 lbs. fat.

SOPHIE GILSLAND TORMENTOR (123584). Dam made as a 4-year-old 15,952 lbs. milk, 888 lbs. fat.

SOPHIE 19TH GRANDSON (165221). Dam made 15,578.7 lbs. milk, 809.5 lbs. fat.

The bulls we offer are close up to the World's Champion producer Sophie 19th of Hood Farm. Correspondence solicited. We would appreciate information about your herd, so as to price you bulls calculated to add size, type and increased production.

Portland, Oregon
Wed., Nov. 17, 1920

The Jersey Show at the Pacific International will be the greatest gathering of Jerseys ever shown west of the Rocky Mountains. There are 330 entered in classes, representing the leading breeders. The management of the Show have assured us that they will have all awards placed in the classes by Wednesday, the day of the

Golden Rule Jersey Sale

This sale is under the auspices of the Oregon Jersey Cattle Club. The consignors include many of the leading breeders of the Northwest. The requirements are rigid, every cow must have a large R. of M record, every heifer must be from a R. of M. dam, every animal sound, (an ideal time to secure the best in the west). Among the bulls we find:

A son of Poppy's Dortha, 994 lbs. fat, World's record, three-year-old.

A full brother to Lulu Alphea of Ashburn, 800.08 lbs fat. World's record senior yearling.

A son of Old Man's Darling 2nd, 983 lbs. fat. Mona Loa of Waikiki, grand champion, Spokane Fair 1920, and winner of many other prizes.

Plan to be at the great Pacific International on Wednesday, November 17.

Catalog giving details of offering and consignors will be published...Send to Sale Manager for one.

CONTENT'S MERRY BOY OF PROSPECT (64022)
Dropped December 23, 1919
SIRE—Anton's King Confidence (43517). DAM—Content of Prospect (54491) A. R. 5960

A solidly built calf that well represents the famous animals in both sides of his pedigree. He is deep bodied, has a good heart girth and is very well developed in every way.

His sire has six May Rose crosses and is one of the best individuals we have ever owned. The dam of Anton's King Confidence made 764.65 lbs. of fat as a junior four-year-old.

The get of A. K. C. are really wonderful individuals. Next week in this space we will show a group of his young heifers. Look them over and figure for yourself how one of their half brothers would help your herd.

Content of Prospect is a good producing cow and made 312 lbs. of fat as a two-year-old on herd rations and only twice a day milking.

If you want this young fellow write us immediately.

Hoard's Dairyman Farm, Fort Atkinson, Wis.

New York Butter Market

NEW YORK CITY, NOVEMBER 1:—The situation in the butter market has improved considerably and receivers are less pessimistic than at this time last week. The change can be attributed largely to the change in weather conditions as temperatures have fallen materially during the last few days. It is very probable that jobbers and retailers allowed their stocks to become depleted as they became free buyers at the outset last week. Another factor which undoubtedly served to cause a better feeling was the report from Denmark that the Danish delegation to London had negotiated with British authorities for butter deliveries during the month of November. The agreement is that Danish exporters shall deliver to England a minimum of 5,000 casks of butter weekly. There is no limit placed on the quantity of butter that the importers may ship to England, as that country is eager to purchase all the Danish butter that can be secured. The agreement with England necessarily will reduce to the minimum shipments of Danish butter to other countries as the greater part of the present production, aside from that consumed domestically, will be needed to fill the English orders. That means that importation of Danish butter in this country will practically cease for a month at least. That should give our merchants sufficient time to dispose of their stocks of domestic butter that have accumulated.

The demand in this market for the last several weeks has been confined principally to butter that will score 92 points or above. With the awakened activity of last week, there came considerable demand for high quality firsts and there were some inquiries and a few sales of a few lots of undergrade butter. While there are vast stocks of such butter in stores yet, the condition as compared with that of the last few weeks is greatly improved. Receivers see possibilities of clearing their accumulations with less losses than they had anticipated. Centralized butter is in more demand than it has been of late and higher prices are being asked. Reports are current that some of the large centralizers have been forced to close their doors because of their large losses during the past few weeks. It is hoped that in the future more stress will be laid on quality by the centralizers and less on quantity in order that the average quality of American butter may be improved.

The quality of the butter being received shows little improvement as yet. It is estimated that less than 2% of the butter being received can be classed as fancy. Why that condition should be more pronounced this year than heretofore is a conundrum. Many creameries which for many years have made practically no butter that would class below the grade of an extra are now shipping butter of variable quality, ranging from an occasional churning of extras down to low firsts and seconds. Buyers are extremely suspicious of all butter under present conditions and are much more critical than ever before.

On Monday of last week, the market early showed evidences of a quickened demand and the quotation on extras advanced 1c. Each succeeding day until Saturday witnessed a similar advance. On Saturday, there was a slackening in activity and the quotation did not change. The same condition obtained today. One encouraging feature of improved market is the fact that prices of undergrades have advanced with those of extras and higher scoring butter. The range in quotations is the widest ever known as there is a difference of 22c between the selling price of an extra and a low second. Established quotations today are: Extras (92 score), 61½@62c; higher scoring than extras (93 score or higher), 62½@63c; firsts (90—91) score, 54@60c; firsts (88—89 score), 47@53c; and seconds (83—87 score), 40@45c.

W. B. LIVERANCE.

A half-day's time will probably suffice to see that all the farm buildings are tight and snug for the winter. It will be a half-day well spent.

Patient bossy may be willing, but she cannot do her neighbor's bit. Each must stand or fall by herself—and some should fall by the butcher's axe!

HOLSTEINS

Oak Dale Segis Pontiac

Our Junior Herd Sire

He is a full brother to our herd sire, the famous, King Oak Segis Pontiac, son of the "marvel of all sires", King Segis Pontiac Count, whose daughters have broken full over 100 world records. His dam is a daughter of Oak De Kol Ollie Homestead, grand champion at the National Dairy Farm Show in 1916.

Oak Dale Segis Pontiac was 15 months old when the above picture was taken and weighed 1,200 pounds. He will have tested daughters at three years of age. We are not holding Oak Dale Segis Pontiac for breeding to the daughters of King Oak, but to help him in developing the Oak Dale Herd.

Oak Dale Segis Pontiac will be used on about 50% of our foundation cows and will help to bring out the wonderful transmitting qualities of the families we are developing.

If you are looking for some real foundation stock, come to Oak Dale Farms, or write us and tell us your wants. Our herd is always open to inspection.

I Now Offer A Grand Son

of two of the greatest sires of the breed. King Pontiac Jane Veeman No. 316983, born Feb. 11, 1920. Color evenly marked, well grown, good individual.

His sire—King Pontiac Mona Veeman, being a promising son of King of the Pontiacs. His first twelve daughters to freshen have records from 16 lbs. to 21 lbs. as 2-year-olds.

His dam—Craig Manor Jane Veeman, A. R. O. record of butter 26.60 lbs., milk 510.1 lbs. Believe she is capable of improving her record at next freshening. She is a daughter of Sir Veeman Hengerveld who now has 125 A. R. O. daughters, 17 with records above 30 lbs. and three with yearly records above 1,000 lbs. of butter, 24,000 lbs. of milk. $300 buys this fellow if taken soon.

Herd under Federal Supervision.

W. D. Robens, Poland, N. Y.

Holstein Bull For Sale

Born Feb. 11, 1920; nearly all white, fine individual, well grown. Sire—a 29.9-lb. proven son of King of the Pontiacs. Dam—a 22.6-lb. cow of splendid dairy type that has produced 80 lbs. of milk a day. Price $200 F. O. B. Sherburne. Inspection invited.

Edwin P. Smith, Sherburne, N. Y.

A Rare Opportunity

to buy a Federal Accredited Herd.

Box 253. Cortland, N. Y.

Young Bulls Backed By Yearly and Seven Day Records

We have for sale a few young bulls, up to 11 months old that are sired by our senior herd sire Finderne Pride Johanna Korndyke. He is one of the best sons of King Segis De Kol Korndyke and from Finderne Pride Johanna Rue, former world record cow with 1470 lbs. butter in 1 year. These youngsters are well grown and are all from A. R. O. dams with records up to 30 lbs. Write us for full information. We will answer promptly.

ANTRIM FARMS, - - - SYRACUSE, NEW YORK.

Judge Your Next Herd Sire——

—By Individuality (That Satisfies)

—By Production (That Determines Value)

Bell Farm Offers a Select Five—for Your Choice

The demand for our young bulls has been very brisk and we are listing below five of the oldest ones we have. We are offering these at atttractive prices that we might place them previous to the winter season. They are all bulls of the very highest order and which we are willing should leave Bell Farm as representatives of its herd.

No. 1 King Valdessa Pontiac Veeman (born Dec. 20, 1919). Sire: King Valdessa Pontiac (our former herd sire — son of Mabel Segis Korndyke, former world champion 40-lb. four-year-old). Dam: K. V. P. H. Colantha with a senior three-year-old record of 30.07 lbs. butter for 560 lbs. milk, also a senior two-year-old record of 22.48 lbs. butter from 432 lbs. milk. She is by King Veeman Pontiac Hengerveld — by King Segis Pontiac Alcartra from a 29-lb. daughter of Sir Veeman Hengerveld. Her dam, a 27-lb. cow with four A. R. O. daughters, is from a 31-lb. ten-year-old that is dam also of a 36-lb. senior three-year-old. "Colantha" is one of the heaviest producing cows in the Bell herd. The six nearest dams of this bull average 33.45 lbs. butter from 607 lbs. milk.

No. 2 King Valdessa Pontiac Cornucopia (born Jan. 8, 1920). Sire: King Valdessa Pontiac (see above — his three nearest dams are three of the breed's first 40-lb. cows). Dam: Von Holigen Cornucopia Johanna with two records above 30 lbs.

At 7 years:
Butter.....30.12
Milk.....559.4

She also has a 30-day record of 116.07 lbs. butter. She is sired by a son of Aaggie Cornucopia Johanna Lad from a granddaughter of De Kol Burke. The two nearest dams of this bull average over 35 lbs. butter.

No. 3 King Valdessa Pontiac Clothilde (born February 10, 1920). Sire: King Valdessa Pontiac (see above — sire of Echo King Sylvia that heads our herd). Dam: Miss Aaggie Clothilde Korndyke with a junior two-year-old record of 15.57 lbs. butter from almost 400 lbs. milk. She is sired by a son of Oak De Kol Ollie Homestead, twice grand champion at the National, her dam a 22-lb. cow from a 19-lb. dam. Five nearest dams of this bull average 28.90 lbs. butter from 565.90 lbs. milk.

No. 4 King Valdessa Pontiac Pietje (born February 13, 1920). Sire: King Valdessa Pontiac (see above — 40 of his daughters in the Bell herd for development). Dam: Avon Pontiac Sara Pietje. At 25 months:

Butter.....22.64
Milk.....404.9
Average % fat.....4.49

She is by Woodcrest Sir Clyde, whose two nearest dams are both 31-lb. cows, his own dam with almost 1,000 lbs. in a year. Her dam is a 19-lb. two-year-old daughter of King Pontiac Artis Canada. Splendid breeding all the way back. A very choice bull.

No. 5 King Valdessa Pontiac Mercedes (born March 6, 1920). Sire: King Valdessa Pontiac (see above — combines in the very closest degree the blood of three of the breed's first 40-lb. cows — son of Mabel Segis Korndyke). Dam: Colantha Algretta Pontiac with 33.07 lbs. butter from 657 lbs. milk and a 30-day record of 123 lbs. butter from 2,645 lbs. milk. Her dam also has a 32-lb. record from almost 600 lbs. milk.

We suggest interested parties communicate with us immediately regarding any of the above calves. We will be glad to send more detailed description, together with pedigrees of any of them. However, in communicating, be good enough to indicate a second choice, for there is a possibility of the one you prefer having been selected by some one else.

Remember the Bell herd was built upon type. Therefore, we feel these animals will go out and make good for their buyers — also that the herd is under State and Federal supervision.

HOME OF ECHO KING SYLVIA

"The Utmost in Quality Holsteins"

CORAOPOLIS, PA.

Sheboygan County Holstein Breeders' Consignment Sale

Plymouth, Wisconsin, Saturday, November 20, 1920

60 Head — Tuberculin Tested

This sale should interest all Holstein enthusiasts looking for something good. Probably the highest record bunch of cattle sold in public sale in Wisconsin since last state sale.

Selected by a committee of breeders for both breeding and fine individuality.

Bred to 31-, 34-, 37-, and 38-lb. sires, one of them a son, another a brother of Pabst Korndyke Cornflower.

A wonderful list of two-year-olds with records.

Five 20-lb. two-year-olds, including Clearland Hengerveld, with 24.47 lbs. as a junior two-year-old. Two of them are bred to King Pabst Pontiac Hengerveld; three of them to Harvest Tyranena Agatha; one of them to Sir Ormsby Beauty Pontiac Segis; and two of them to Pabst Pontiac Adonis. Of these last two, one has finished her yearly work with 595.37 lbs. butter and 15,007 lbs. milk. The other is on yearly work now and has made 446.7 lbs. butter and 10,285.3 lbs. milk in 7 mos., 10 days.

CLEARLAND HENGERVELD, 24.47-LB. JUNIOR 2-YEAR-OLD
CONSIGNED BY D. E. VANDERHOOF, WALDO, WIS.

Year Record Cows

A thirty-one-pound six-year-old will have between 1,000 and 1,100 lbs. for the year, and bred to Pabst Pontiac Adonis, son of Cornflower.

A year record cow bred to Sir Ormsby Beauty Pontiac Segis. Has 748.97 lbs. butter and 20,407 lbs. milk. All ready to go on test again.

An excellent individual, bred to Pabst Korndyke Cornflower. Has 26.36 lbs. butter, 521 lbs. milk in 7 days. Will make close to 1,100 lbs. butter and 23,000 lbs. milk.

Other excellent entries include — A 26.95-lb. cow bred to Johanna Clothilde Pontiac De Kol; a daughter of a 27.67-lb. cow, and bred to a son of the 37-lb. Ormsby bull; dandy heifers sired by King Veeman Pontiac Alcartra and Sir Longfield Pearl Spofford.

Males

There will be a bull whose nine nearest dams average 1,000 lbs. and whose eleven nearest dams average 30 lbs.

A son of Neith Admiral Witteen Walker, and whose dam is on yearly test, has made over 1,000 lbs. butter in 328 days, and will finish with about 1,100 lbs. butter and 25,000 lbs. milk as a senior 4-year-old.

A son of Sir Longfield Pearl Spofford, whose dam is now making 1,000 lbs. butter for the year.

Several sons of Adonis, a son of the $30,000 cow. One is from Mountain Ash Belle, who recently sold for $1,250. She is on yearly test, and has made over 300 lbs. butter in 6 months. Her dam is on yearly test also and making fine record.

Let's All Be There

Farm one and one-half mile S. (Sauk Co.) KIRKPATRICK BROS., Reedsburg, Wis.

Watertown, Wis. Holsteins — *They Satisfy*

Tuesday, November 23 — 85 Head

A sale of hand picked black and whites — a sale made up largely of springers selected from the choicest herds in Dodge and Jefferson Counties — a sale backed by the guarantee which always accompanies these semi-annual events conducted by the Watertown Holstein Sales Co.

The election is over, men, now is the time to buy before the so called slump vanishes. Vanish, it will because there can be no permanent depreciation in Holstein values. Milk is milk for all time and Holsteins give profusely of it — especially Watertown Holsteins. The intrinsic value of the Watertown Holstein has not diminished one iota. If you can buy them cheaper this fall than you could last spring, do so; it's your good fortune, but remember that our offerings are on a par with that of previous sales. Because we have rejected everything that would tend to lower the standard already attained, we feel justified in laying special emphasis on the above mentioned fact. We could not afford to assemble an array of inferiors and mar the good impression made on you heretofore. We want your approval — your good will — your patronage.

Our consignors, as well as their offers, will convince you; Carnation Farms, Oconomowoc, have selected a show bull from a 24-lb. dam now on yearly test, also a choice yearling heifer that will please you.

Harvest Farms, Mayville, are bringing one of their full aged bulls — a son of a 22-lb. two-year-old — second dam 30 lbs. This bull was surpassed only by Cedar Lawn Canary Paul at the Wisconsin State Fair. They also offer two choice heifers bred along the lines that are bringing Harvest Farms to the front rapidly.

Spring Brook Farms, Burnett, include in their consignment a gracefully outlined daughter of a 27-lb. cow, due sale day and bred to their son of Sir Piet. — also a half sister to Ormsby Korndyke Lad. This Spring Brook stuff will please you.

Fred Albrecht, Watertown, is offering two handsome, large framed cows, springing up and bred to their well-known $4,300.00 bull — also two yearling sons of this bull from splendid record dams.

Wuetrich Brothers, Doylestown, have a 25-lb. cow of real Holstein type — a good 20-lb. cow, an A. R. O. granddaughter of Canary Paul Fobes Homestead — others of equal merit — all bred to their herd sire — a son of that highest record daughter of "37th" and by Sir Pietertje Hengerveld Ormsby.

Ernest Kuehn, Horicon; a yearling son of a 27-lb. four-year-old — a son of a 23-lb. three-year-old, a choice heifer.

Andrew Frank, Fox Lake, will consign nineteen choice ones picked by one of our directors— mostly springers — daughters of his well-known 35-lb. sire in calf to his 37-lb. son of King Valdessa.

E. J. Goetsch, Watertown, a dandy yearling 29-lb. bull, with lots of pedigree.

Arthur Weihert, Watertown, a quality co wof rare individual merit. Then we have these well-known breeders who will have splendid cows, heifers and some yearling bulls, men whose cattle have always made good — whose cattle have raised our sales to the high position they hold in public esteem. Otto Brandt, Horicon; James Barstow, W. W. Bird, J. F. Schmidt, Randolph; F. G. Lehmann, F. Bartelt, W. Strauss, Watertown; Edwin Gibs, Fox Lake; H. Ryder, Hustisford.

Come to this sale — it's genuine.

And if you buy
they'll satisfy

Consign this Son of

Sir Pietertje Ormsby Mercedes 41st

to the

Waukesha County Sale at Waukesha, Wis., Nov. 22nd

Summit Bonny Pietertje Ormsby

Born May 9, 1920

His Sire

SIR PIETERTJE ORMSBY MERCEDES 41ST

Sir P. O. M. 41st now has 13 A. R. O. daughters, one making 39.77 lbs. as a 4-year-old. He is better known as the $65,000 bull. He is the only son of Spring Brook Bess Burke, the only 1,000-lb. cow in the world to have three 1,000-lb. daughters. 41ST is the sire of the Grand Champion cow at the 1920 Waterloo Cattle Congress.

His Dam

BONNY JOHANNA MOOIE DE KOL

His dam, 7 days, butter 29.64 lbs., milk 518.9 lbs.; 305 days, 694.42 lbs. butter, 18,124.8 lbs. milk. She will be tested at next freshening and then will be put on yearly test. She is one of our best foundation cows and surely will increase her records.

Breeders should not overlook this opportunity of securing such a beautiful individual by so great a sire as Sir Pietertje Ormsby Mercedes 41st, and from one of our foundation cows that is sure to increase her records.

Facts in BLACK & WHITE

Paid in milk for Purebred Holsteins

The Reveille, Bellingham, Wash., reports that the Pacific Condensery Co., sells high grade Holsteins to the ranchers at cost, taking payments in milk.

The company needs more milk and by introducing Holsteins expects to make dairying a profitable industry, thus increasing the acreage in dairy farms as well as the milk output per average cow. Just another instance of the standing of Holsteins among business men.

Send for free Illustrated Booklets. They contain valuable information for any Dairyman.

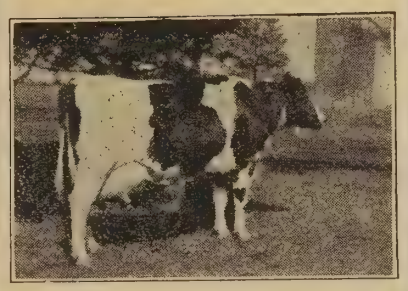
Both tuberculin tested and guaranteed right.
Pinehurst Farms Co., Sheboygan Falls, Wis.

Waukesha County Holstein Breeders'

Twelfth Semi-Annual Sale



Monday, November 22nd

85 WAUKESHA COUNTY HOLSTEINS 85

WOODCROFT PERFECTION

His dam produced: At 5 years—37.41 lbs. of butter in 7 days, 1,046.12 lbs. of butter in 365 days, 27,008.40 lbs. of milk in 365 days. At 6 years —40.25 lbs. of butter in 7 days. Most of the Duke Burnell herd which is being dispersed is bred to him.

BONNY JOHANNA MOOIE DE KOL

29.64 lbs. butter, 518.9 lbs. milk in 7 days; 694.42 lbs. butter, 18,124.8 lbs. milk in 305 days. A 7-month-old son of this cow sired by S. P. O. M. 41st. A wonderful individual. Good enough for any herd.

(REFERENCE SIRE)
UNEEDA KORNDYKE ABIGAIL BOY

A 33-lb. grandson of Johanna McKinley Segis. Considered by Waukesha men as one of the best bulls in service.

Females there will be:—

A young 27-lb. sister to Wellington Vashti Korndyke, who is now making close to 1,200 lbs. of butter in a year.

Several daughters of Maplecrest King De Kol 2d, a 29-lb. grandson of King Pontiac Champion, Wisconsin's greatest sire.

A daughter of S. P. O. M. 43rd out of a 27-lb. cow.

Two daughters of Hillvale Sir Ormsby bred to Aaltje Salo Johanna Pontiac 2d.

A choice young cow heavy in calf to the great show bull, Bairdland Pontiac Champion.

Two 2-year-old daughters of Pabst Hengerveld Pontiac, the 34-lb. son of King Pontiac Champion and bred to Nockdair King Superba Supreme, whose dam has three records that average over 30 lbs. in seven days and is now on yearly test going at a 1,000-lb. rate.

A two-year-old daughter of Pietertje Kapijne Lad heavy in calf to Pabst Hengerveld Pontiac.

A daughter of Veeman Segis Pontiac heavy in calf to Hillvale Endymion, one of the good sons of King Pontiac Champion, out of one of the best daughters of King Ormsby.

A yearling daughter of Portage Pauline King out of Aaltje Salo Netherland De Kol Beets.

A two-year-old daughter of Daisy Johanna 5th bred to Hengerveld De Kol Beets 8th.

An A. R. O. daughter of Elm Lawn McKinley Segis, bred to Spring Farm Tweede Pontiac Cornucopia, whose two nearest dams average 40 lbs. of butter in seven days and whose dam also has a yearly record of 1,127 lbs. of butter.

A young 25-lb. daughter of Piebe Van Beers and sired by a son of Johanna McKinley Segis. She was the First Prize Three-Year-Old and also a member of the First Prize Dairy Herd at the Wisconsin State Fair in 1920. Bred to King Bess Johanna Ormsby.

An A. R. O. daughter of a 29-lb. cow with a yearly record of over 800 lbs. of butter, Jessie Fobes Pietertje De Kol, who is a granddaughter of Homestead Junior De Kol. This heifer was Second Prize Two-Year-Old at the Wisconsin State Fair in 1920.

A dispersion of the Duke Burnell herd, made up of choice young cows carefully selected and bred for a number of years. They are all large type cows of the milking type. Some of them with good official records, all of them capable of making official records, either on short or long time work. Most of them are heavy in calf, due to freshen early this winter to Woodcroft Perfection, Wisconsin's first forty-pound bull with a yearly record of over 1,000 lbs. Woodcroft Perfection is being used at the head of five of the largest herds in Waukesha County. We feel that this is an opportunity.

Three choice daughters of Sir Pontiac Piebe De Nijlander, a 24-lb. son of Sir Korndyke Hengerveld De Kol 8th.

Two choice daughters of Sir Ormsby Skylark Keepon, who not only is an excellent individual son of Sir Ormsby Skylark, but is transmitting some very good individual daughters.

Many others equally as good. If looking for the best cows to milk this winter and choice young stock do not miss this opportunity to buy them at your own price.

Bulls there will be:—

A son of Carnation King Sylvia, "the $106,000 bull", and out of a 35-lb. daughter of Sir Pietertje Ormsby Mercedes, who has three records above 30 lbs. and has a 290-day record of close to 20,000 lbs. of milk and 806 lbs. of butter. This bull represents a combination of the two greatest blood lines of Holstein-Friesian breed. He combines the blood of May Echo Sylvia and Sir Pietertje Ormsby Mercedes in the best possible manner. This is the first time that this combination of breeding has ever been offered for sale. He is a wonderful individual, good enough for any herd. WHAT IS HE WORTH?

A son of S. P. O. M. 41st out of Bonny Johanna Mooie De Kol who has 29.64 lbs. of butter in seven days, and 694 lbs. of butter and 18,000 lbs. of milk in 305 days. A wonderful calf that will grow into more money as his dam will have a better chance.

A son of S. P. O. M. 43rd, who is good enough for Tilly Alcartra to be bred to, and out of a 30-lb. cow, Ashburn Segis Maid, a good individual and nicely marked.

A yearling son of Longfield Paul Fobes Homestead and out of a 26-lb. cow who is sired by a full brother to Pietertje Maid Ormsby.

A son of Creator, whose three nearest dams average 1,048 lbs. of butter in 365 days, and out of a 22-lb. two-year-old daughter of King Pontiac Champion.

A ten months old bull out of a 26-lb. cow and sired by Sir Ormsby Skylark Keepon, perhaps the best individual son of Sir Ormsby Skylark.

A yearling son of Aaggie Nephele Hengerveld, Grand Champion Cow at the Waukesha Dairy Show in 1920. She has just finished a yearly record of over 1,000 lbs. of butter. His sire is Grahamholm Pontiac Segis Lad, a 30-lb. bull with a yearly record dam of close to 1,000 lbs. His top line is as straight as a string.

15 choice bulls selected from the herds of different Waukesha breeders, most of them sired by Waukesha's greatest sires and out of choice young cows with good records or capable of making good records. A great number of these bulls are bound to increase in value as most of the dams will be given an opportunity. If you are looking for producing blood at a reasonable price, don't miss them.

S. P. O. M. 43RD

You know him. One of his daughters out of a 27-lb. granddaughter of King Segis and one of his good sons from a 25-lb. dam consigned.

Each animal comes from a tuberculin tested herd. Animals over six months sold subject to a 60-day retest.

Just What You've Wanted—

A Daughter and A Son of

Sir Bess Ormsby Fobes

SIR BESS ORMSBY FOBES—$30,000 SON OF S. P. O. M. 37TH AND WISCONSIN FOBES—NOW HEADING THE GUSTAVE PABST HERD

They will be sold at your own price

Nov. 19, at Lake Mills, Wis.

In the Jefferson County Holstein Sale

The daughter — Linden Lawn Violet Ormsby — born Dec. 25, '18, is an excellent individual, well marked and very well grown. She is in calf to her great sire and due to freshen Dec. 8. She is from an A. R. O. dam.

The son — Linden Lawn Spofford Ormsby — is 14 months old and a dandy. He'll make you a real herd sire. His dam, a 22-lb. cow has a good year record made as a 2-year-old and is now being fitted for a real chance at full age.

Both the son and daughter were show ring winners this fall. This is the first daughter of "Sir Bess" we have ever offered. It's your opportunity.

Linden Lawn Stock Farm, R. 1, Jefferson, Wisconsin

LETZ

America's Leading Feed Mill

Buy at this "Sign of the Letz" and get dependable grinder service. Displayed by leading dealers everywhere.

POULTRY RAISERS *should write for important Letz literature on Feeding for Earlier Poultry Profits*

Thousands of Whirling Scissor-Like Edges *Cut, Grind* and *Pulverize* the Grain

SHOWN above are the famous patented self-sharpening, steel grinding plates, used exclusively in Letz Feed Mills.

These plates have revolutionized feed grinding. They mean double-grinding capacity—cut usual feed costs in half—grind everything grindable—enable farmers to economically grind and mix their own feed instead of buying it ready mixed.

Thousands of keen-cutting, scissor-like edges running in opposite directions, cut, grind, and pulverize to dust in one operation. No other process is so fine-cutting, so light-running, so durable, has such capacity. One set of Letz Plates is guaranteed to outwear three sets of ordinary plates.

11 SIZES
22 STYLES
½ to 40 H.P.

The Letz Dixie Mill above is a heavy-duty, all-purpose grinder of amazing strength, speed, and grinding capacity. Corn fodder, kaffir corn, alfalfa, etc., are fed over the feed table at the same time corn and small stuff is fed into the hopper. All are ground in one simple operation, at half the usual cost in time and fuel. Ask about the Letz DIXIE.

Cut down your feed costs, increase your profits by using "Letz-ground feed." A Letz Mill for every need — each mill backed by 30 years of experience. Hundreds of thousands of satisfied users attest to Letz supremacy. Investigate!

Free! Two books that every feeder should read — our catalog and "Scientific Feeding." Write for them now.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LX | FORT ATKINSON, WIS., NOVEMBER 19, 1920. | Number 18

HEREDITY AND PRODUCTION

R. R. GRAVES, U. S. DAIRY DIVISION

THE selection of breeding animals is a most important question with dairy farmers, yet there is considerable disagreement as to what theory to accept and follow. Shall selection be based upon production records, upon type, or upon that intangible something that is said to enable the great breeder to pick a great sire by intuition, as it were?

These problems and other breeding problems were discussed before the Connecticut Breed Associations' meeting by Mr. R. R. Graves, who has charge of the experimental breeding work of the U. S. Dairy Division, which the editors of Hoard's Dairyman believe to be one of the most important lines of work ever undertaken by the Division. After going somewhat technically into the theories of inheritance and the transmission of production in dairy cattle, Mr. Graves said:

"The many experiments and demonstrations with various plants and animals which have proved that the factors governing hereditary characters are transmitted in the germ plasm, convince us that the producing ability of any heifer, granting that she is normally developed, depends upon the combination of factors governing production that she has derived from each of her parents. What the parents were able to transmit to this heifer depended upon the combination of factors that they, in turn, derived from their parents. Does it seem reasonable, if the producing ability of the ancestry of a heifer is unknown, that one can tell by looking at that heifer what the combination of factors governing production in her germ plasm holds forth for her as a producer? Can we tell by type? We can tell if she has a big, roomy barrel, a big heart girth, a pliable skin, a well hung, capacious udder, a level rump, and the general breed type. But do those points in her conformation prove to us that she has the combination of factors that will make her a big producer?

"We may grant that a cow in order to be a big producer must have the capacity to handle large amounts of feed and this means that she must have a large capacious barrel. In order to produce large amounts of milk, she must also have an udder with capacity. She must also have constitution, and we have been accustomed to looking at the heart girth for indications of this. Whether or not the heart girth indicates constitution, we need not discuss here. Our large producing cow must also have a large flow of blood to the udder, and we have looked to the milk wells and milk veins for indications of this. A few years back, I ligated the milk veins of a cow and she continued to produce normally, showing that the interior veins are capable of taking care of the flow of blood from the udder.

"Let us grant, however, that in heavy producing cows of all breeds these general points in conformation are found; but do these points change proportionately to the difference in production of various cows? Do we find a proportionately bigger barrel, a more capacious udder, on the 800-pounds-of-fat cow than on the 600-pounds-of-fat cow? In addition to these, in order to have *type* we must have a straight back, a level rump, a well balanced udder, well filled crops, pretty heads, and so on.

"Do not think from this that I do not like type. I like to see a typy cow as well as anyone, but we should consider carefully the extent to which type aids us in selecting production.

"It seems to me that type and production are for the most part two different things. A sloping rump is objectionable because we do not like its appearance, and therefore we want to select breeding animals with level rumps; not because it will affect the production of the animal, but because it is unpleasing to look at. It is questionable if many sway back cows have weak backs, but even though the sway back does not indicate weakness, it fails to present so pleasing an appearance as the level back. And these same things may be said of the homely heads, heavy horns, thick necks, hollow crops, and to a certain extent level udders. Perhaps the best balanced udder will be the most capacious, though we have all seen cows with low, pendulent udders that had capacity, but that were not desirable because of the udders' shape and liability to injury.

"Over in India and China the water buffalo is said to be a good dairy animal, having been known to produce as high as 270 pounds of fat under their conditions. The type of these animals would not appeal to us, however, with their sloping rumps and hump backs. A short time ago, I saw a rather noted producing cow that had a very noticeable dip in her back where the thoracic vertebrae and the lumbar vertebrae meet. I saw a daughter of this cow, also a splendid producer, that showed the same peculiarity in conformation. Three sons of this cow did not show the dip in the back themselves, but it was noticeable in the daughters of two of the sons and also in the granddaughters of one son. This dip in the back was a detriment to the appearance of these animals, but I question if it had any effect on their producing ability.

"We should breed the most beautiful animals that we can, and that means that we must by all means give consideration to type in the selection of our breeding animals. But in order to breed production, we must be guided by production records. The man who is able to breed great producing animals that also have fine type, has accomplished an infinitely more difficult achievement than he who breeds animals of fine type with ordinary production, or he who breeds animals of superior production with inferior type, for when the number of characters that we select for is increased, we greatly increase the difficulty of combining the desirable factors for those characters.

GUERNSEY COW, FIRST DAWN, AND HER 13TH CALF AND A FUTURE HERDSMAN
At 12 years of age this cow made 608 lbs. fat. She is now 15 years old and owned by Woodend Farm, Minnesota

The Question of Line Breeding

"With many breeders, the first consideration in selecting a bull is that he be related to the last sire that was used, or of the same family as that which predominates in the herd. If some relationship does not exist, the opinion prevails that the animals mat-

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

A Kansas Dairy Show

HOARD'S DAIRYMAN:—A dairy production contest will be one of the main features of a four days' dairy show, to be held at Paola, November 30 to December 3, by the Eastern Kansas Agricultural Association. A prize of $50 will be given for the cow producing the most butter-fat during seven days, and another prize will be given for the cow giving the most milk during the week. The tests will be carried on under the supervision of the dairy department of Kansas State Agricultural College, while the show is in progress. All tests will be official, and those for Holsteins will be accepted by the association as Advanced Registry tests. Individuals from each of the four main dairy breeds have been entered in the dairy cattle show. The show is open to all breeders and those from any section of the country may enter. All cattle must be tuberculin tested before they will be permitted to enter. Provision has been made for testing all animals free of charge before they are entered in the show. A good many herds, which have been entered, are already on the government accredited list, but these will be tested also.

A large number of Missouri and Kansas breeders are taking an interest in the show, and will have the best individuals from their herds entered. L. B. Smith, of Paola, secretary of the show, states that there is stall room for from 150 to 200 head of cattle in the sales pavilion, and that space can be furnished for additional entries. H. W. Cave, of the dairy department of Kansas State Agricultural College, will be the judge.

A dairy products show will be put on in connection with the dairy cattle show. Milk, butter, cheese, and other dairy products, may be entered in this.

Kansas. GEO. A. MONTGOMERY.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

"Willie, what is a dairy farm?"

"A place where they raise cows."

"Right, and now what is butter-fat?"

"It's the extra a farmer makes on his butter that he didn't expect to make."

⚜

At Thanksgiving time it is just as well to remember that one of the biggest reasons we have for it is the herd of fine cows back there in the barn.

⚜

"Has the length of a cow's tail anything to do with her pedigree?"

"Well, it puts her in the aristocrat class when it comes to killing flies."

⚜

Thanksgiving Day

Thanksgiving Day, Thanksgiving Day,
The time of prayer and grub and play.
The kitchen has an incense sweet,
And pies bedeck the window seat.
The good things cooking seem to whet
The awful appetite we get.
Give me some pumpkin and some mince,
And spread this buttered bread with quince!

Thanksgiving Day. Thanksgiving Day!
The plumes of celery are gay.
Cranberry sauce is glowing red,
The sun shines blessing on your head.
And from the oven comes a whiff
That makes each little tiker sniff.
Give me some white meat, if you please,
I'm busier than honey bees!

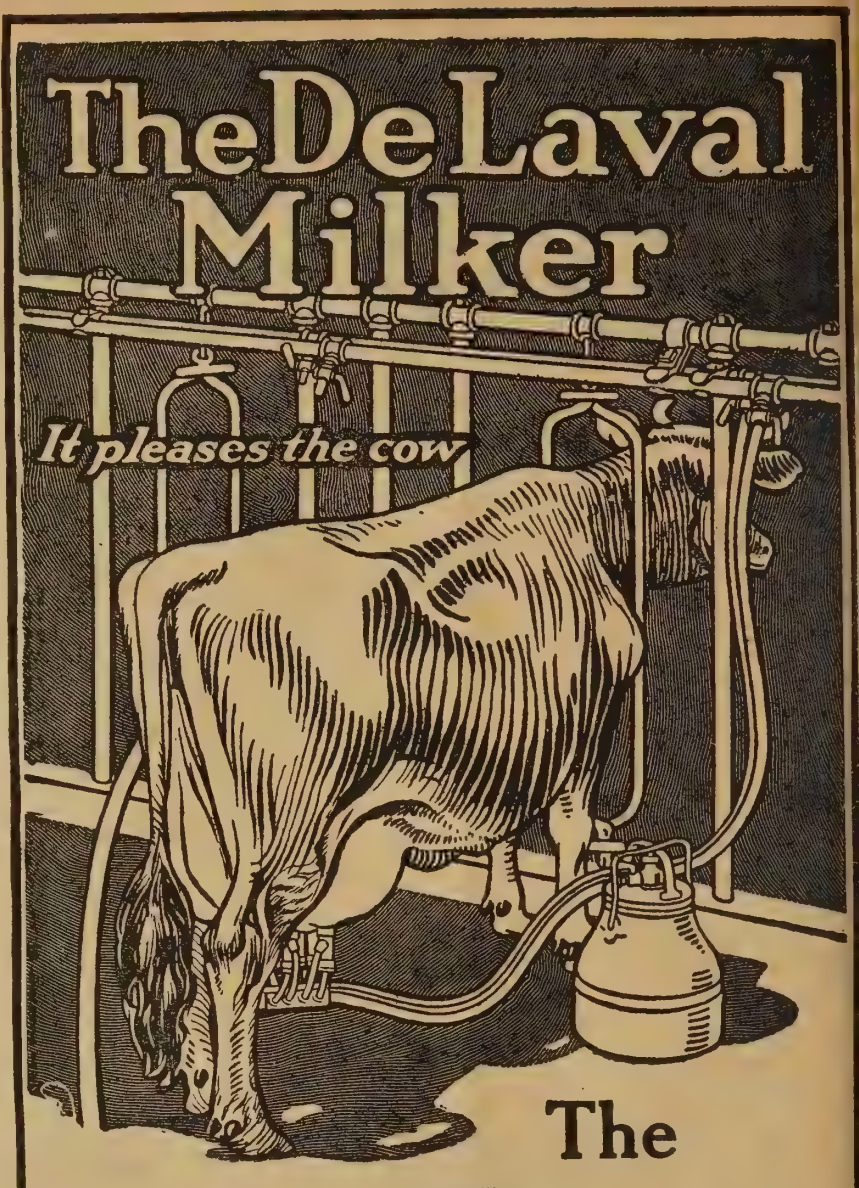
Thanksgiving Day! Thanksgiving Day!
It's fairer than the buds o' May.
Stewed onions, sweet potatoes plump,
A turkey perched on every stump.
When folks on farms decide to eat,
Believe me, it's a merry treat!
Give me a drum-stick—gravey, too,
And ma, I drink the health o' you!

⚜

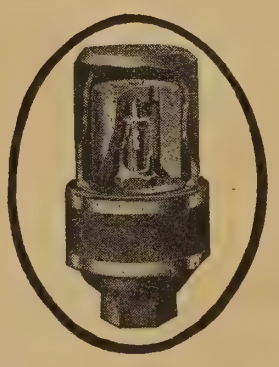
In times like these, I'd rather be a silo, filled with rich ensilage, than the finest art gallery in town.

⚜

If



If you can keep your head when all about you
Are losing theirs and blaming it on you;
If you can trust yourself when all men doubt you,
But make allowance for their doubting too;
If you can wait and not be tired by waiting,
Or being lied about, don't deal in lies,
Or being hated, don't give way to hating,
And yet don't look too good nor talk too wise.



If you can dream and not make dreams your master;
If you can think—and not make thoughts your aim,
If you can meet with triumph and disaster
And treat those two imposters just the same,
If you can bear to hear the truth you've spoken
Twisted by knaves to make a trap for fools,
Or watch the things you gave your life to, broken,
And stoop and build them up with worn-out tools:

If you can make one heap of all your winnings,
And risk it on one turn of pitch and toss,
And lose, and start again at your beginnings
And never breathe a word about your loss;
If you can force your heart and nerve and sinew
To serve your turn long after they are gone
And so hold on when there is nothing in you
Except the Will which says to them: "Hold on"!

If you can talk with crowds and keep your virtue,
Or walk with kings—nor lose the common touch,
If neither foes nor loving friends can hurt you,
If all men count with you yet none too much;
If you can fill the unforgiving minute
With sixty seconds worth of distance run,
Yours is the earth and everything that's in it,
And—which is more—you'll be a man, my son!

—Rudyard Kipling.

The Vacuum Controller

(The Vacuum Controller is not shown in the part of the Milker installation pictured above. It is placed in a convenient place in the installation.)

The safety and success of a milking machine are largely dependent on the uniformity of the vacuum, and the De Laval Vacuum Controller is so constructed that correct and constant vacuum is maintained at all times.

The Vacuum Controller is scientifically designed for its purpose and fully covered by pending patents. No adjusting is necessary; the correctness of each Controller is determined and fixed at the factory and it cannot be adjusted, changed or tampered with.

The Vacuum Controller is entirely automatic and can be depended on to maintain a uniform vacuum in the system at all times. Experienced dairymen appreciate the importance of this strong De Laval feature.

The De Laval Milker has many other exclusive features distinct both in design and operation, which makes it positive and uniform in action from day to day; and faster, more economical and more reliable than any other method of milking. The sanitary features are of special importance and will be much appreciated by dairymen in their efforts to produce milk having the highest market value.

An additional insurance of lasting satisfaction to users of De Laval Milkers lies in the De Laval Company's well-known facilities and reputation for service.

The Tie That Binds Producers Together

Crop Contracts Essential Feature of California Co-operation

HERMAN STEEN, ILLINOIS

WHEN a California farmer joins a co-operative marketing association, he signs a contract which requires him to deliver all of his crop to the association. This contract extends over a period of years, and provides that the grower shall pay damages to the association if he sells his crop to any outside dealer.

This binding crop is one of the essential features of every co-operative marketing association of consequence in California. This applies not only to the giant institutions which market the oranges, raisins, and prunes, but also to the little fellows which handle a few carloads of alfalfa or the honey produced by a small district.

The leaders in California co-operation borrowed this idea from Denmark, where it was used by the bacon and butter selling societies. The Danish co-operators regarded it as a fundamental feature, because it kept their rivals from breaking up the societies by temporarily paying higher prices for the products of the members. The California co-operators have found the contract as essential to their success as did the Danes, and have worked out many improvements over the Danish model.

Solves Financial Difficulties

Originally, the crop agreement was used only as a means of keeping the members of an association in line. It was regarded mostly in the light of safeguarding an association's supply of products. This, of course, is still the primary purpose of the crop agreement, but it has also been found to be the key which unlocks the financial difficulties of co-operative associations. Briefly stated, the crop agreements give the association title to the product when it is delivered, and this allows the association to borrow money to pay advances to the growers. The association can then market the crop at the most favorable time, which it could not do if the growers were constantly demanding money from the sale of their crops, as was the case before this plan of contract and finance was perfected.

Even a casual study of the history of co-operation in California reveals the fact that the crop contract is an absolute essential to success in co-operative marketing. Today there is not a single co-operative association in existence in California which does not employ the crop contract. There may be some small, local organizations which do not require such contracts, but I was unable to find any trace of such, and farm leaders on the Pacific Coast were unable to name any. Of all the many co-operative associations which have failed, only two or three employed the crop contract. These particular organizations failed, I am told, because their crop contracts were imperfect and could be evaded.

An Essential to Success

Every leader of co-operative thought and action with whom I talked recently when studying co-operative enterprises in the Far West sought to impress upon me that the crop contract is the second great essential to success in co-operative marketing, the first being organization by commodity. Even the leaders of the two opposing schools of co-operative thought are in harmony on this question. I refer to Aaron Sapiro of San Francisco and G. Harold Powell of Los Angeles, who have differed quite sharply at times in regard to the fundamental principles of co-operation.

There are different kinds of contracts in use by the co-operative organizations. The California Almond Growers' Exchange, for example, had no contract as such, but every member is required to sign the by-laws of the association, which provide that members must sell all their almonds through the organization. This, of course, has the same effect as a separate contract specifically requiring the same thing.

Different Kinds of Contracts

The egg associations likewise have simple contracts requiring the delivery of all eggs produced and stating the damages that may be collected by the association in case of violation of contract by the producer. The California Fruit Growers' Exchange (the citrus association) has three contracts, one between the central exchange and the district exchanges, one between the district exchanges and the local associations, and one between the local associations and the producers of citrus fruit. Each of these contracts specifically sets forth the things that each party is required to do.

The contract of the raisin growers, on the other hand, guarantees a minimum price to the growers of raisins. It provides also that in case the land is sold the new owner must fulfill the provisions of the contract. This latter provision has been the source of considerable trouble, and many good lawyers say that it would not be sustained in court, though it has never been tested.

What is probably the most complete contract between association and grower is the new prune and apricot crop agreement, which will soon go into effect between the California Prune and Apricot Growers, Inc., and its 8,000 members. It was drawn by Aaron Sapiro, attorney for the prune and apricot growers, and covers more contingencies than any other contract used in California. Nothing is left to verbal understanding and agreement—everything is put down in black and white, so that there is no possibility of misunderstanding. It is regarded as the most perfect contract of the sort ever devised.

Essential Points of Prune Contract

The prune and apricot contract contains close to 3,000 words and the membership agreement close to 5,000 more, so space forbids printing it in full. The salient feature, however, may be reviewed as follows:

1. The grower agrees to help carry out the express aims of the association, which are co-operative marketing, elimination of speculation and waste, and the stabilization of prune and apricot markets in the interest of growers and public alike.

2. The association agrees to buy and the grower agrees to sell all of the prunes and apricots produced by the grower during 1922, 1923, 1924, 1925, and at the option of the association during 1926, 1927, and 1928. (The present contract includes the crop of 1921.)

3. The grower agrees that the crop has not been contracted to anybody else.

4. The grower agrees to deliver all fruit as early as possible, but in no case later than September 15 for apricots and November 10 for prunes, and to abide by all rules of the association in regard to grading, packing, delivery, etc.

5. The association agrees to sell all fruit delivered to it, and to pay the grower the average price received for the grade he produced, minus the cost of operating the association. The grower agrees to accept this amount as payment in full.

7. The association agrees to pay a substantial advance to the grower at the time the crop is delivered, and to distribute proceeds as rapidly as possible through the year, but final payment shall be made not later than July 1 for apricots and October 1 for prunes. (These dates refer to the year following delivery.)

8. The association is allowed to sell the prunes and apricots when and where it deems fit, under such conditions as will serve the grower and the public.

9. The association's subsidiary (the warehousing corporation) capital stock is to be retired by profits made in mechanical handling of the prunes.

10. The grower is allowed to sell any or all of his fruit to dealers and shippers of fruit, provided he does not sell to any speculator who might interfere with the sale of the dried fruit handled by the association.

11. If a grower transfers his orchard of fruit to a relative, he shall be liable for damages in case the fruit is sold to an outside dealer.

12. This association recognizes crop mortgages if it is notified in advance concerning them.

13. It is agreed that all contracts between the association and growers shall be substantially alike.

14. If a grower violates his contract by selling dried fruit to outsiders, he agrees to pay to the association two cents per pound damages on prunes or four cents per pound damages on apricots, plus expense of collection. This is what puts teeth into the contract, and makes a man think twice before he tries to break it.

Under the provisions of the damage clause, practically every co-operative association in California has brought suit against growers for violation of contract. In every single case, so far as I was able to learn, the association has won and the growers were ordered by the courts to fulfill their contracts. The association does not usually sue for damages as much as it does for fulfillment of contract. One such case has recently been appealed to the Supreme Court of California, which has not yet announced a decision.

Importance of the Contract

Some of the important reasons why the binding contract is the cornerstone of co-operation are thus summarized by Attorney Sapiro:

1. It insures the association a definite acreage over a period of years, and from this the actual volume of business can be estimated quite closely. This stabilizes the association and permits it to operate to better advantage than would be possible otherwise.

2. It puts the association in a strategic position on the market. It gives the farmer a representative on the market, which he never has had heretofore. A commission man is often worse than no representative at all, and as often as not is secretly representing the man who buys from the farmer.

3. It eliminates competition in buying, and the association's business cannot be broken by speculators who are willing to pay high prices and lose money temporarily in order to accomplish that purpose.

4. It allows the association to put all of its efforts on efficient salesmanship, while the producer puts his efforts on efficient production. The man who is tempted by a cent a pound cannot seriously injure an association.

5. It provides a means of securing credit, so that crops may be moved and first payments made before they are actually sold. The fact that the association secures title to the crops when delivered allows it to borrow money and make first payments at that time. The contract has thus solved the financial question in co-operation to a large extent, for bankers lend money readily on the basis of the contracts.

Practically all of the co-operative associations in California are increasing the percentage of crop controlled. The success of the associations in securing renewal of these ironclad contracts is assurance that the growers recognize the justice of the crop contract and the necessity for its use.—Copyright, 1920, Standard Farm Papers.

LEMON PACKING HOUSE IN SOUTHERN CALIFORNIA

Co-operation is as good a thing in the home as anywhere else. Co-operation, you know, is only conducting yourself so others will find it easy to work with you and get along with you.

THE "MEIEREI"

GEORGE CECIL, FRANCE

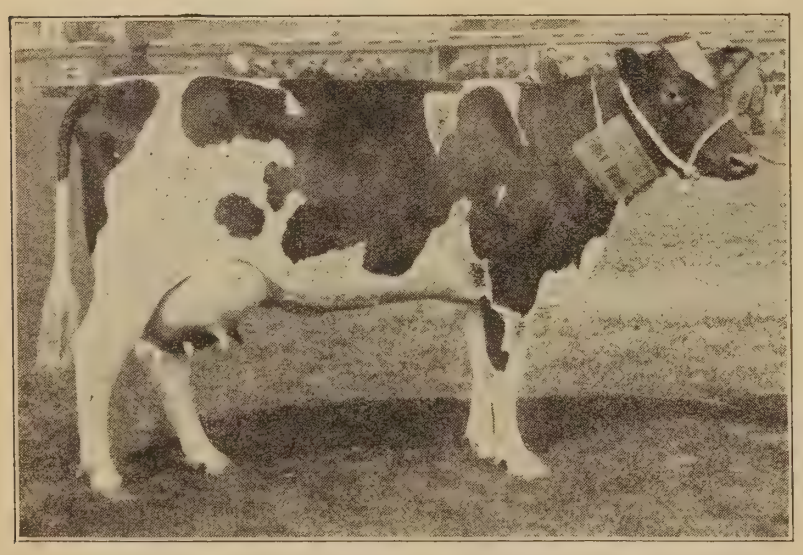
STRICTLY speaking, the "meierei" is the dairy attached to a Swiss hotel, and to which those staying in the hotel repair at all hours of the day. Some frequent it because they are on a milk regimen, and others because they happen to like milk. Besides, 'tis pleasant to meander through the romantic dells and well-kept hotel grounds leading to the meierei, picking the varied wild flowers, devouring the inspiring view, and breathing the delicious pine-scented air preparatory to recruiting exhausted nature with a glass of frothy, creamy milk fresh-drawn from the sleek cow.

There are, of course, meiereis and meiereis. The very small hotel, for example, finds it far cheaper to deal with the itinerant dairyman than to pay for the upkeep of a cow, or cows. Occasionally the proprietors of two or three hotels share a meierei, dividing the expenses and the output. The arrangement, however, has its drawbacks, for the sharing may lead to disputes which can only be wiped out in something stronger than milk. Besides, the guests from the hotels may discuss, too freely, the terms they pay and the accommodation offered by mine hoost. "Eighteen francs a day, and your room looks on the stable? Why, I pay but sixteen francs, and I am surrounded by mountains—mountains covered with snow. Only one meat course? Ah, I get two, and often game as well." "Truly, I have been swindled. Tomorrow I leave for your sumptuous sixteen francs' worth."

Indeed, the commonwealth meierei has often resulted in strained relations between once friendly bonifaces. When this happens, the partners close the establishment and patronize the dairyman.

In some places the meierei is simply an open-air tea-shop situated at some distance from the town. Here, of an afternoon, all the world meets to sample the delicious little cakes and the admirable pastry for which Switzerland is famous. Or, if you prefer mountain honey, it is yours for the asking—and the paying. Milk, of course, is to be had in abundance, dashed with cream at a cost of a few extra centines. In fact, many of the habitues, after a substantial meal of coffee and cakes, call for a huge glass of milk. The bulky proprietor and all his staff smile with satisfaction when they hear the order. For does not each glass mean an addition to the dividends—and to the tip?

A TYPICAL MEIEREI SET AMIDST TYPICAL AND DELIGHTFUL SURROUNDINGS



In cosmopolitan towns, such as St. Moritz, in the upper Engadine, the meierei is a large and important institution accommodating several hundred persons who hail from every country under the shining sun. French, Russians, Italians, Americans, English, Portuguese, Spaniards, Roumanians, Serbs, Greeks,—all foregather there and everyone unites in praising the enterprise of the proprietor. The meierei, in fact, is the club, the meeting-place, where social engagements are made and sight-seeing plans discussed.

The long, rambling building usually is divided into two or three tea rooms, in one of which are two or more long tables laden high with every imaginable—and unimaginable—dainty. But no one dreams of using the rooms when the weather is fine. Indeed, if it rains, the comparatively small space under the awning is crowded to the verge of suffocation by people who have not come to Switzerland to stay indoors. In short, so intrepid are some of them, that rather than sacrifice a single breath of fresh air, they take their milk under dripping umbrellas. "Mad! stark, staring mad," is the comment of the Swiss who, having as much open air as they want all the year round, cannot understand anyone who can af-

From Forest Shades to Holstein Pastures

L. L. OLDHAM, Secretary Wisconsin Holstein Breeders' Association

AMONG THE STUMPS AND FALLEN TREES THEY FOUND US

NORTH of the Mason—Dixon Line in Wisconsin, which is another name for the tracks of the Green Bay and Western Railway which reaches from Green Bay to Winona, is a veritable empire of pasture lands and cropping fields. Not many years ago the ring of the "lumberjack's" axe and the swish of the falling tree were the familiar sounds—today we listen to the bellow of the bull or the ringing of the bell on the leader cow's neck. It is a welcome sound in any case, for on the back of the dairy cow, more than on any other farm animal, rests the responsibility of development of this empire, and she is building well. Once a land of timber, sawmills, and lumbering operations, now it is rapidly coming to be known as the land of cows, clover, and creameries.

The recent activities of Holstein breeders and their respective county associations took the writer through this region, particularly into Marathon and Bayfield Counties. One notes with surprise, but with admiration the wonderful opportunities of this "North Country", as the usual traveler involuntarily calls this portion of the Badger State.

In Marathon County we visited the county agent, Frank Swoboda, a real hustler and a regular dynamo of better farming energy. He gave us the statistics which "sizes" our perspective—forty-three townships, fifty-eight thousand hustling farmers, fifty-five thousand dairy cows, the second largest hay acreage in a Wisconsin county, a group of enterprising, forward looking and forward thinking bankers who are farm boosters, and thriving towns.

In Bayfield County we traveled for awhile with V. E. Brubaker, another sterling agricultural leader. Day in and day out this United States Department of Agriculture and State Agricultural College representative is hitting the high spots in his car and giving the best that is in him to the agricultural development of another particular spot in this northern area. He told us of the 2,000 farms and their good crops of oats, barley, potatoes, fruit, and hay. We saw them. We also saw excellent prospects for plenty of silage for the 18,000 dairy cows. Here again, we have a bunch of banker boosters—many of them told us they were doing their bit to stock up and we believe them.

We've "made" the whole of this "North Country". We have seen similar conditions throughout. These two counties were our points of contact this time. We have gone through the empire—traversed it by daylight, on train and by car. It seems a land of assets and no liabilities, a veritable empire of cows and creameries.

Seventeen years ago John L. Chrouser moved onto a farm in upper Wisconsin. He liked Holsteins and his admiration for the breed and his desire for a herd soon led him to the farm of T. F. Vannedon in Wood County. Mr. Vannedon had two Holsteins for sale. They were sisters, Minerva and Cora Beets. John had his choice. He took Cora. Later Mr. Vannedom consigned Minerva to a Wisconsin Holstein sale. Minerva was attractive—both of these sisters were exceptional. Bob Haeger, of auction fame, saw the possibilities and took her home to Algonquin as his property. Eventually she found a place in his show string. Dairy cattle history has reported her winnings and extolled her quality each fall for years past. Seven times has she stood at the head of her class at the National Dairy Show and brought the purple ribbon to the hand of her Illinois owner. Last year was her last in the show ring says her owner. However, she will be exhibited as a typical exponent of the breed. She is now 14 years old and Bob says when she dies she will find a place of honor waiting her in the Haeger family lot. She put "Bob" on the map just as her blooded sister Cora put Mr. Chrouser into the limelight as one of the foremost breeders in this land of promise.

From the beginning made 17 years ago, with the purchase of Cora Beets, has sprung a herd of about 35 head. Appreciating the value of the good sire was a stepping stone in Mr. Chrouser's success. He searched much before he finally put his confidence in Pontiac Hendrick Burke. The foundation cow as before mentioned is Cora Beets and fully one-half of the present herd are descendants of these two animals. This combination of male and female, together with a certain amount of good fortune, is responsible for the valued holdings of Mr. Chrouser. However, back of the animals is a faith in the laws of breeding; a faith in the future of

"LIKE BEGETS LIKE OR THE LIKENESS OF AN ANCESTOR"

dairying and the north country; a well spent fund of good common sense; and a keen appreciation of the black and white breed.

Mr. Chrouser did his first official testing the last year. He has long been a member of his cow testing association and the last year in the local association, Cora, now 15 years of age, made over 10,000 lbs. of milk and more than 400 lbs. of fat. He plans to run this good old matron on official test this year.

Among his first records made very recently we find Cora Beets Oaks, a granddaughter of Cora Beets. On test during the month of July she made at 5 years 17.8 lbs. fat and 457.8 lbs. of milk.

Oaks Pontiac, another granddaughter of Cora, made 15.38 lbs. fat and 407 lbs. of milk as a junior four-year-old.

Sadie Burke Cornucopia, a great granddaughter of Cora, made 11.07 lbs. fat and 287 lbs. of milk as a junior 2-year-old

Hot weather records—made, as you will note, in July, 1920. Not so bad, is it?

There are other cases of merit up there. We mention this one because it is a striking object lesson for dairymen over this entire United States of America to "go thou and do likewise". This entire area of Wisconsin is booming in the live stock game and especially is this true with Holsteins. Mr. Grover of Minnesota. As secretary of the county Holstein association of his county he is a moving spirit among his fellow men. Then there was the herd of Fieldmier Bros., as fine a herd of about 20 head as you would ever hope to see, evidence of good bulls and a faith in the live stock and diversified farming business. There were others, too, like the Schroeder Bros., the Smiths, the Yderstad Bros.; oh, yes, they were all converted to dairying, going onward to success with their breed through the use of better sires, better females, In Marathon County there are more than 300 breeders of Holsteins, all of whom are using right good registered bulls and who belong to their county organizations. More than one-third of them have a start with pure-bred females.

Here again Marathon County is cited merely as an example. Bayfield, Barron, Burnett, Douglas, Price, Langlade, and many others are in the game. In Bayfield County we found such fellows as Thoralf Yderstad, a short course graduate of our college of agriculture, and once herdsman for and A. R. O. work. There were some to be sure who were talking selling out because of the "stake" on fruit this year. But they are the hit or miss kind of fellows. Adventurers, we call them in every day walks of life. They wind up on the rocks of despair or are doomed to forever take orders from the "stickers".

What is being done in this north country with dairy cattle of all breeds is a surprise even to those of us who are in closest touch. It is a revelation to the casual traveler. What it means to the settler to get a monthly dividend check through cows is readily seen by visiting those who "dairy it" and have a start with pure-breds. We visited several who "aim to make their money easier." We couldn't see the evidences of easy money, but we could see the progress of those who have tied their load of hopes to the foster mother of the world. God speed the day when we can go forth into the land that was once a land of forest shade and now is given over to dairy pastures, and see herd after herd of dividend payers, machines which convert raw materials into the necessities of life, and see farm after farm as the home of happy contented folk who are operators of the factories which more than four score and ten statesmen have eulogized as the very foundation of our national welfare and prosperity!

Oiling Harness

HOARD'S DAIRYMAN:—I would suggest the following method of oiling a harness: Get a barrel, fill it three parts full of water, float about one inch of oil on top, and then dip the harness. Hold the harness up a few minutes to drain. All the harness can be oiled in a short time. I prefer mineral oil, "machine oil".

Philadelphia, Pa. W. H. R.

Who'd board a hired man all winter if he didn't work? Then why board the hen that never lays an egg?

MODESTY WITH PRIDE

Wisconsin Lands for Investment

Land values are based on the average production of land over a period of years Where production is good, demand for land increases and value rises. That is what has made Illinois, Indiana and Iowa land bought for a few dollars an acre in the pioneer days worth $200, $300, $400 per acre today.

It is proven that Northern Wisconsin lands under cultivation will produce more per acre in dollars and cents than the highly developed farms of the central west. There are 100,000 acres of these lands that can be bought right now for from $12 to $25 per acre on attractive terms.

20% Down Balance on or Before 5 Years at 6%

Colt Carbide Light and the Sun Are Alike to Hens!

A NEW YORK State farmer who enjoys the benefits of Colt Carbide Lighting and cooking in his home installed two Colt burners in his hen house last November.

In three weeks his egg production jumped from 10 to 100 eggs per day!

Colt Carbide Gas light is so near actual sunlight that it fooled the hens into working summer hours in winter weather.

You can have this bright, mellow light—the nearest approach to sunlight—in every room of your home and in the barns, too, at a twist of your fingers. You can keep your kitchen cool and clean by cooking with it. It will enable your wife to use a self-heating flat iron.

The Colt Carbide Lighting and Cooking Plant is easy to install, it is so simple that the hired man or a boy 12 years old can keep it in operation with but a few minutes attention each month. Costs nothing to maintain when not in use and is most economical. Colt home made gas light is clean, odorless, smokeless.

Association Notes

Monona — Farmersburg, Iowa:—One registered bull was bought during October. Three members bought five head of registered females, these being the first pure-breds on each of these three farms. Three cows were sold to the butcher and three grade cows with cow testing association records were purchased. Two carloads of alfalfa hay were shipped in and another carload of cottonseed meal ordered. A few of the men have opened their silos. About one-half of the members combined soy beans with the silage corn. The highest milk record for the month is 1,536 lbs. milk, 58.4 lbs. fat, from a 3-year-old Holstein grade in G. A. Sabbann's herd. Last year this heifer had the honor of being the first heifer to go over 50 lbs. fat with first calf. Feed prices are: Silage, $4 per ton; mixed hay, $20; alfalfa, $36; oats, $40; corn and cob meal, $40; barley, $40; bran, $40; cottonseed meal, $70; oil meal, $80.

Rutherford County, Tennessee:—Several very fine cows have been added to the herds of this association. Chas. Pearson bought a very high bred milk cow. Mr. Pearson, who entered the show circuit with his Jerseys for the first time this year, was very successful, winning six firsts and six other prizes at the Tennessee State Fair, ninety per cent of the prizes at the Bedford County Fair, and every prize offered at Huntsville, Alabama, Fair. Kingswood Farm also purchased a fine young heifer.

Juniata County, Pennsylvania:—A committee of three farmers has been appointed to purchase the feed supplies for this association. At present there is an order in for a carload of bran. September market milk sold for $3.89 per cwt. The creamery paid 75c per pound for fat. Milk retails for 12c per quart and butter for 65c per pound. Feed prices are: Corn and cob meal, $45.80 per ton; ground oats, $56.20; bran, $63—$65; cottonseed meal, $77.30; oil meal, $80; Union Grains, $80; Peerless Dairy Feed, $70; hay, $25.

Rock Prairie, Wisconsin:—Four unprofitable cows were sold during October and one pure-bred Guernsey cow and five pure-bred Holstein heifers purchased. Three herds have been tuberculin tested this month. Market milk testing 3.5% sold for $3.70 per cwt. and 4c per point above. Milk retails for 14c per quart, butter for 64c per pound, and cheese for 35c per pound. Oil meal is rated at $72 per ton; bran, $37; barley, $1.70 per cwt.; oats, $1.80.

Richland County, Wisconsin:—More balanced rations are being fed. One grade Holstein herd was sold during October and replaced by registered Holsteins. Seven unprofitable cows were sold. Market milk testing 4% sold for $2.60 per cwt. The condensery paid 68c per lb. for fat, the creamery 59c, and the cheese factory 60c. Milk retails for 12c per quart, butter for 57c per pound, and cheese for 28c per pound. Feed prices are: Oats, 62c per bushel; corn, $1; barley, 69c; bran, $38 per ton; oil meal, $75; alfalfa hay, $30.

Amherst—Nelsonville, Wisconsin:—In September the creamery paid 65c per pound for fat. Milk retails for 12c per quart and butter for 60c per pound. Bran is rated at $38 per ton; oats, $34; oil meal, $70.

Fort Atkinson, Wisconsin:—The creameries paid 58c to 63c per pound for fat during October. Feed prices are: Silage, $7 per ton; alfalfa hay, $30; bran, $37 to $41; oil meal, $66 to $69; gluten, $58 to $70; barley, 90c per bushel; oats, 62c.

Monticello, Wisconsin:—A thousand-dollar pure-bred Holstein bull was purchased to head a pure-bred herd in this association. Most of the members are now feeding grain and silage. One member has put six cows in Advanced Registry with official testing, and others are to start soon. There are a few unprofitable cows left. Fourteen pure-bred Holstein cows were sold from one herd and two from another. September market milk testing 3.5% sold for $3, $3.20, and $3.70 per cwt. Milk retails for 10c to 15c per quart, butter for 65c per pound, and cheese for 25c to 35c. Feed prices are: Oats, 70c—75c per bushel; barley, $1.20; bran, $46 per ton; oil meal, $67.50 to $74; silage, $8.50; alfalfa, $30.

Wahkiakum Co., Washington:—One registered Jersey bull was sold to replace a scrub. Four pure-bred Jersey females were added to one of the herds last month. The creamery paid 71 cents per pound for fat in October.

Pioneer, Minnesota:—Market milk sold for $4.83 per cwt. in October. The creamery paid 71 cents per pound for fat. Milk retailed for 14 cents per quart, butter 65 cents per pound. Silage cost $4—$6 per ton; hay, $10—$20; bran, $34—$40; oil meal, $64—$70; corn, 55—70 cents per bushel; oats, 40—45 cents; barley, 65—75 cents.

Year's Report of Edgar Association

This association finished its first year on October 22nd. High prices of feeds and the excessively dry summer caused a curtailment in production. The average of the entire association is 6,140 lbs. milk and 247.1 lbs. fat. One of the lowest herds has an average of only 4,794 lbs. milk and 193.3 lbs. fat. The owner, however, is making a fine effort to get better cows and has sold six for beef, has purchased two pure-bred females, is planning on buying a few good grades, has had his herd tested for tuberculosis, and, what is most important, has signed up for another year of

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

C. A. LIBBEY COMPANY
195 Marion Street Oshkosh, Wisconsin

Practical Low Cost **Sewage Disposal**

You can provide your home with all sanitary conveniences—baths, toilets, etc.—by use of HYDRO-KAUSTINE SEPTIC TANK and system. This most efficient device, with a little tiling, gives you a most effective sewage disposal outfit for home, school, factory, or other rural building. It is buried; no odors, no vermin; no attention; no cost. Design is government-approved; built of enameled Armco iron. Construction and operation both Guaranteed.

No Operating Cost

But see for yourself how easily, inexpensively sewage disposal can be secured. Ask for Free Booklet H. D-1.

SPECIAL AGENTS Splendid opportunity for live men. Easy sales work. Write for territory.

testing. The herd of Bernard Baeseman, grade Guernseys, produced fat at the lowest cost per pound, which was 21c. The cow producing butterfat at the lowest cost per pound, 17c, is a grade Guernsey owned by Edwin Amhaus. These cows freshened in the spring and went onto pasture soon after freshening, consequently Mr. Baeseman fed very little grain and Mr. Amhaus fed none at all, which accounts for the low feed cost. Fourteen cows qualified for the Register of Production. The high cow is a grade Holstein owned by Hart Brothers, which produced 11,666 lbs. milk, 427.1 lbs. fat. A pure-bred Holstein owned by Herman Pilgrim was second with 11,477 lbs. milk, 420.8 lbs. fat. The next three are two grade Holsteins owned by R. W. Olson, producing 10,817 lbs. milk, 417 lbs. fat, and 10,023 lbs. milk, 396.7 lbs. fat, respectively; and a grade Guernsey owned by E. W. Pfrang, producing 8,703 lbs. milk, 402.2 lbs. fat.

A year of testing proves the folly of dairy farming without testing. Every farmer had his poor cows and it was encouraging to note the way some of the members went after the improvement of their herds. During the year several of the members purchased pure-breds, ten herds were tested for tuberculosis with 13 reactors so far, six scrub bulls were routed, and two other members were induced to use their neighbor's pure-bred bull. Sixty-eight cows were sold for beef. The high herds are those of Hart Brothers, averaging 326.7 lbs. fat; Herman Pilgrim, 324.7 lbs. fat; R. A. Rietzow, 324.4 lbs. fat; R. W. Olson, 321.4 lbs. fat; E. W. Pfrang, 311.2 lbs. fat.

A Connecticut Yearly Report

The 197 cows completing a year's work in the Canaan County, Connecticut, Cow Testing Association averaged 7,000 pounds of milk containing 260.8 lbs. of fat; the average valuation given the product of these cows was $253.72, with an average feed cost of $114.41 per cow. The income over cost of feed was nearly $140.

The tester for this association, Mr. B. F. Dibble, makes the following comparison between the highest and the lowest producing herds in the association: The high herd in the association consisted of 10 cows that produced a total of 86,560 lbs. of milk containing 3,199 lbs. of fat, while the lowest herd in the association consisted of 21 cows, or double the number of the high herd, yet it only produced 93,072 lbs. milk containing 3,975 lbs. of fat. The product of the high producing herd was valued at $3,105 and the total cost of feed for these 10 cows was $1,189; while the product of the lowest herd was valued at $3,145, with a total feed cost of $1,448. The income above cost of feed for the former was $1,916 and for the latter, $1,697. In other words, the 10 cows in the high herd produced $219 more profit above cost of feed than did the 21 cows in the low herd. This computation as to profit takes no account of the additional labor or expense involved in housing and caring for double the number of cows. The tester makes a special note that the low producing herd received only home grown feeds, the assumption being that the other herds were fed a more varied ration and possibly a better balanced ration.

Jersey Cattle Notes

For week ending October 29:

Number of animals registered: Bulls, 202; cows, 558; total, 760. Number of transfers recorded: Bulls, 183; cows, 589; total, 772.

BUILT FOR DURABILITY

CP Xtra-strong Milk and Cream Cans

are famous the country over for long life and accurate measure. They are heavily tinned from pure block tin after stamping. All joints are loaded with solder and the interior is absolutely smooth. There are no bacteria harbors. Neck and breast are joined on a powerful press in a perfect grip-lock joint, water-tight before tinning.

The Climax can shown herewith is a splendid can for wagon use, for delivering milk and cream to the creamery, etc.

How Can I Get More Milk?

This question is in the mind of every keen dairyman anxious to keep his herd on the best paying basis. It can be answered by using more intensive methods of feeding—methods that have been approved by America's most successful dairymen. You cannot pay too much attention to this question of feeding. Upon it largely depends the health and milk flow of the cow.

International Special Dairy Feed

MIXED RIGHT — PRICED RIGHT

International Special Dairy Feed is scientifically mixed. Its formula has been O.K.'d by experienced dairymen who proved that it made more milk. For many years thousands of dairymen have used it exclusively. Give it a fair test. Put one-third of your herd on a ration of International Special Dairy Feed for three months. Can be used as an entire grain ration or mixed with home-grown grains. Then compare the milk production with results secured from other feeds. You will secure more milk than from any other mixture of similar analysis. Order a ton of International Special Dairy Feed from your dealer and start making this test at once. It means more milk. And more milk means more money.

Buy Permanent Protection

When you invest in a cream separator you can't afford to take chances with a machine that through faulty bowl construction retains particles to sour and taint the next day's skimming. You can't afford to buy a machine that destroys the body of the butterfat. You can't afford to use a machine that promotes unsanitary conditions in your dairy.

The one cream separator that will give you adequate protection against all of these faults is the

Primrose

Its bowl is absolutely free from holes and crevices in which milk can lodge. It is simple in construction, easy to wash. It skims at low speed, insuring the delivery of cream of the highest butter-making quality. Its clean lines and open base provide for sanitary conditions wherever it is used. Its rugged construction and automatic oiling system insure long life and easy running.

Bear these facts in mind when you are ready to buy a new cream separator.

Western Royal Live Stock Show

THE second annual Western Royal Live Stock Show was held at Spokane, Wash., November first to fifth. It is pre-eminently a fat stock show and dairy cattle formed but a small part of the exhibition. There were only two breeds of dairy cattle represented and the total number of animals shown was 83, of which 40 were Jerseys and 43 Holseins. Outside of a very few animals they were all commendable representatives of their breeds. The West grows good cattle. They are large, of good conformation and many have made exceptionally good records.

The dairy industry in the section tributary to Spokane is in its infancy and beef predominates. The small display of dairy cattle at the Western Royal plainly shows there is not a strong sentiment for the dairy cow among the farmers of that section. Those engaged in the breeding of cattle are putting forth united effort to popularize the cow, for they see her opportunity and necessity in their agriculture.

The report was current that there would be no dairy cattle admitted at next year's show, for their room would be needed for fat cattle. The breeders of dairy cattle will put forth effort to keep the dairy classifications and it is to be hoped that they will be successful. Those just starting to build herds need the education of the show ring. It will teach them proper dairy type and keep them from making many foolish mistakes in the selection of foundation stock. The show ring by no means takes the place of pedigree and records, but no man can be a successful breeder without taking into consideration type, conformation, and pedigree. Let us hope that the officials of the Western Royal Live Stock Show will continue a place for the dairy breeds.

Holsteins

There were five exhibitors of the black and whites and their animals would have been a credit to any show. Hollywood Farms had the largest number of animals on exhibition, and they were a very uniform lot. This exhibit emphasized the breeding qualities of their herd bull, Judge Segis, that was grand champion at the Pacific International Live Stock Exposition, Portland, 1919. Hollywood Veeman Segis, a grandson of Judge Segis, as a yearling won first and grand champion. He is an exceptionally well formed bull, deep bodied, long, rather high from the ground, straight back, large, and of good dairy quality. He lacks in masculinity, but this will undoubtedly come with age.

Hazelwood Ormsby Korndyke De Kol was senior and grand champion cow. She is now owned by Waikiki Farms and bred by John L. Smith of Hazelwood Farm. She is a very good cow, a little heavy over the shoulders, and not of the extreme dairy type of her stable mate, Hazelwood Ormsby Segis, a two-year-old and a competitor for grand champion. The judge would have made no mistake if he had made the latter grand champion.

The best class shown was the junior heifer calves and John L. Smith received 1st, 2nd, and 4th prizes.

The judge was J. B. Irwin. The exhibitors were as follows: Waikiki Farms, Hollywood Farms, Thos. J. Owens, John L. Smith, and F. E. Parks, all of Washington.

The awards are as follows:

Junior yearling bull—1, Owens on Hollywood Veeman Segis; 2, Hollywood Farm on Hollywood Fayne Segis; 3, Parks on Crystal Rock Johanna Joliet. Senior bull calf—1, Hollywood Farm on Hollywood Illustrites Segis; 2, Parks on Crystal Rock Johanna Hartog. Junior bull calf—1 and 2, Smith on Willow Springs Sir Ormsby and Hazelwood Heilo Posch Ormsby.

Cow three years and over—1 and 2, Waikiki Farm on Hazelwood Korndyke De Kol Ormsby and Hollywood Lelita Piebe De Kol. Cow two years and under three—1, Waikiki Farm on Hazelwood Ormsby Segis; 2 and 3, Hollywood Farm on Hollywood Segis Lady Fayne and Hollywood Segis Mercedes De Kol; 4, Parks on Susie Astrea De Kol Segis. Senior yearling heifer—1, Waikiki Farm on Uneeda Butter Girl, 2 and 3, Hollywood Farm on Hollywood Segis Belle Pontiac and Hollywood Segis Phoebe Veeman; 4, Parks on unnamed. Junior yearling heifer—1, Hollywood Farm on Hollywood Hengerveld Segis; 2, Parks on Crystal Rock Johanna Lass. Senior heifer calf—1, 3, and 4, Hollywood Farm on Hollywood Lilith Segis, Hollywood Mercedes Veeman, and Hollywood Segis Tetonkje; 2, Smith on Hazelwood Queen Heilo. Junior heifer calf—1, 2, and 4, Smith on Hazelwood Leda Heilo Ormsby, Hazelwood Leda Heilo Korndyke, and Hazelwood Heilo Josephine Ormsby; 3, Hollywood Farm on Hollywood Lilith Belle 2d.

Young herd—1 and 2, Hollywood Farm. Calf herd—1, Smith; 2, Hollywood Farm. Get of sire—1, Hollywood Farm; 2, Smith. Produce of cow—1, Hollywood Farm.

Junior and grand champion bull—Owen on Hollywood Veeman Segis. Senior and grand champion cow—Waikiki Farm on Hazelwood Ormsby Korndyke De Kol. Junior champion cow—Waikiki Farm on Uneeda Butter Girl.

Jerseys

There were 40 Jerseys competing for ribbons and there were many fine individuals. Competition was the greatest between the Glen Tana Farm and Waikiki Farm and when the battle was finished honors were about even. The Glen Tana Farm received the champion prizes on its bulls, Glen Tana Golden Fern Lad winning senior and grand champion and Glen Tana Golden Boy, junior champion.

Waikiki Farm won the champion prizes on females. Morier's Golden Ladd was senior and grand champion. She is a good type, deep body, well developed udder, refined, and has

AUSTIN'S MAY POGIS AND HER TWIN HEIFER CALVES, JERSEYS OWNED BY WM. MAC PHERSON OF GEORGIA

As a two-year-old this cow produced 7,823 lbs. milk, 467.5 lbs. fat. Thirty days after finishing her test she dropped her heifer calves. In June her name appeared in the list of 50-lb. Jerseys, her fat production being 53.68 lbs.

made good at the pail. Junior champion was won by Pilot's Duchess.

The judge was J. B. Irwin.

The exhibitors were as follows: Glen Tana Farm, Waikiki Farm, R. J. McGoran, and W. G. Barlow. all of Washington.

The awards are as follows:

Bull three years or over—1, Barlow on Viola's Graceful Boy. Bull two years and under three—1, Glen Tana Farm on Glen Tana Golden Fern Lad; 2, Waikiki Farm on Mauna Loa of Waikiki. Senior yearling bull—1, Waikiki Farm on Count's Foxy Owl; 2, McCorran on Trotsy's Flying Fox. Junior yearling bull—1 and 2, Waikiki Farm on Bonny's Pet of Waikiki and Esther's Pilot of Waikiki; 3, Glen Tana Farm on Glen Tana Sultan's Count. Senior bull calf—1, Glen Tana Farm on Glen Tana Golden Boy; 2 and 3, Waikiki Farm on Waikiki's Morocco Duke and Waikiki's Owlet. Junor bull calf—1, Waikiki Farm on Belle's Pilot of Waikiki; 2 and 3, Glen Tana Farm on Glen Tana Morocco's King and Glen Tana Dairyman.

Cow three years or over—1, 2, 3, and 4, Waikiki Farm on Morier's Golden Maid, Bessie of Shady Lane, Indiana Lady's Diana, and Emeline's Easter Lily. Cow two years and under three—1, Waikiki Farm on Owlet's Drucilla; 2, Glen Tana Farm on Glen Tana Sibyl 2nd; 3, Barlow on Pilot's Grey Mousie. Senior yearling heifer—1, Waikiki farm on Pilot's Duchess of Waikiki. Junior yearling heifer—1 and 2, Glen Tana Farm on Glen Tana Astrea and Glen Tana Sultan's Nelly; 2 and 4, Waikiki Farm on Pilot's Edena of Waikiki and Pilot's Coomassie of Waikiki. Senior heifer calf—1, Glen Tana Farm on Glen Tana Dorothy; 2 and 3, Waikiki Farm on Pilot's Trilby of Waikiki and Pilot's Valentine of Waikiki; 4, Pease on Mary's St. Mawes Glow. Junior heifer calf—1 and 2, Glen Tana Farm on Glen Tana Lois and Glen Tana Morocco Eva; 3 and 4, Waikiki Farm on Waikiki's Pilot Rosalie and Pilot's Rockland of Waikiki.

Aged herd—1, Waikiki Farm; 2, Glen Tana Farm. Young herd—1, Glen Tana Farm; 2, Waikiki Farm. Calf herd—1, Glen Tana Farm; 2, Waikiki Farm. Get of sire—1 and 3, Glen Tana Farm; 2, Waikiki Farm. Produce of cow—1 and 3, Glen Tana Farm; 2, Waikiki Farm.

Senior and grand champion bull—Glen Tana Farm on Glen Tana Golden Fern Lad. Junior champion bull—Glen Tana Farm on Glen Tana Golden Boy. Senior and grand champion cow—Waikiki Farm on Morier's Golden Maid. Junior champion—Waikiki Farm on Pilot's Duchess of Waikiki.

Worthless Farmers

HOARD'S DAIRYMAN:—Nature makes a quart of milk given by a 4,900-lb. cow look just as good and taste just as good and be, in fact, just as good as the quart made by the 8,900-lb. cow. Both quarts of milk are on the same market and sell for the same price. Nature makes one potato in a hill from a field, so far as the individual potato is concerned, just as good as a like sized potato from a field yielding four or five times as heavily. A half bushel of apples picked from a tree receiving no care at all, and possibly and very likely these are the only good ones from the three barrels that the tree bore, may be just as good as a similar amount from a properly cared for tree, and these apples sell for the same price. The point is that too much stuff is produced that is produced as a bare margin above family sufficiency. The careless, worthless farmer can exist on what he and his family have stolen from the soil; if he can get anything for his surplus he is satisfied. His extra stuff is what gluts the market. We have too many such farmers.

The war drove out and away from the farms a lot of worthless men. How much did it decrease production? The better farmers were left and they had a chance. They also had to work harder.

Greater disaster and discontent will follow a poor sale of five thousand bushels of wheat if it is the entire crop and only product of one man's farm than as though it were the combined surpluses of two hundred and fifty farms. Similarly, milk wars hit the heavy producer where it hurts while the fellow who has a hat full of milk suffers little.

What profit to a man to maintain a sanitary dairy when the filthy milk of a shiftless neighbor is mixed with his at the station? Can you name one price fair and profitable to both?

Progressive farmers have been working for a co-operative law. What will they do with it after they get it? There are enough scrub farmers in the United States to kill any co-operative effort the better men may try to launch. Progressive men wear themselves out trying to show no-account farmers where they will be benefitted. With what avail? Parasitic farmers make more off and out of such associations than the members who do the work and suffer the hardships. Some inducement to continue, is it not? Every loyal member of a co-operative association is a philanthropist, and there are some of us among this group that think we are fools. We are likely to grow pessimistic when we think upon these facts and conditions.

Besides having to contend with outside disturbances we have our inside troubles. We have to convince, educate, or convert our own "bunch" as well as the ones we seem to think in opposition to us or our best interests. This agricultural development is first a case of education; and the ones most needful of it are the hardest ones to get. The farm bureaus have not reached this class. Time after time have we held meetings, even down to the school-district plan, and the ones who most needed the meeting were not present. Farmers' institutes do not get these fellows. The only thing that will ever get under their

(Continued on page 820)

50 bushels of Corn per acre on $30 Land—

LIVESTOCK PAYS ALONG THE

Seaboard

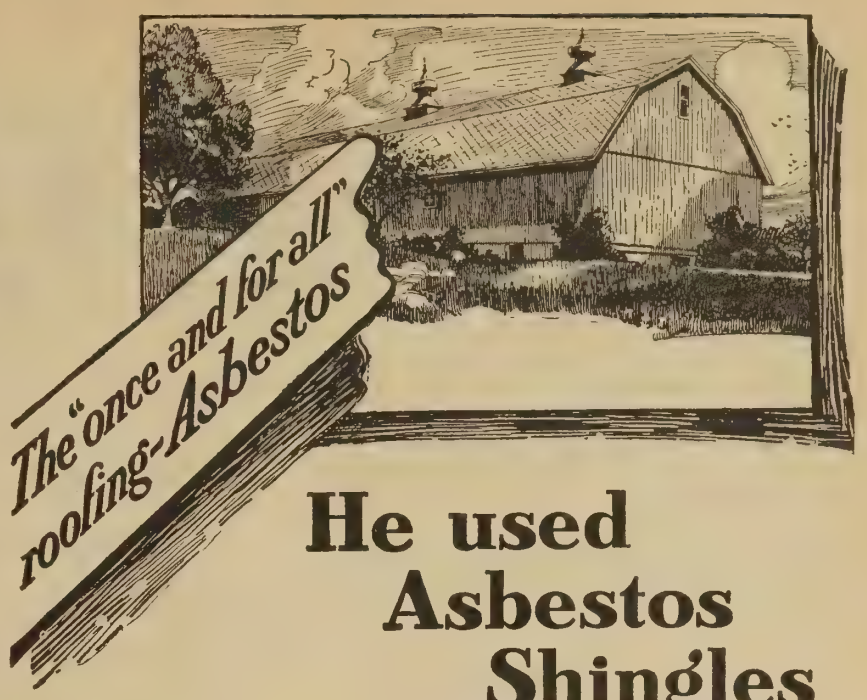
the south's newest great railway

Productive prairie land that only costs about $30 per acre often produces 50 bushels of corn.

Home-Grown Concentrates Year-Around Pastures

Instead of having to buy quantities of cotton seed, soy bean and velvet bean meal, the farmers along the Seaboard grow their own soy beans, velvet beans and peanuts.

As a pork maker, the average acre of peanuts is equal to 60 bushels of corn per acre. The average acre of sweet potatoes is equal to 100 bushels of corn.



Pasturage every month. No sheltered barns are needed. Dairying, cattle and hog raising pay the maximum profit.

The Seaboard opened up a new prairie country in Florida, Georgia, Alabama, South Carolina, North Carolina and Virginia.

Write me for illustrated book and information.

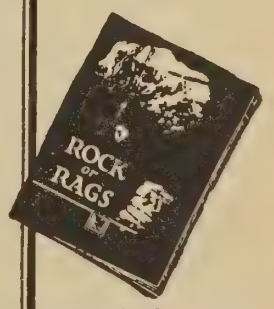
He used Asbestos Shingles

You may prefer some other form of Asbestos Roofing—but see that it is Asbestos.

NO matter which of the many types of Asbestos Roofing you choose the result will be a roof that is both economical and fire safe.

You will have a roof that will free you from the worry and expense of patching or painting, a big point when farm labor is so scarce.



This is because an Asbestos Roof is a permanent roof—a roof of stone. In Asbestos Roofings the fibres of Asbestos rock are felted together and water-proofed with natural asphalt*—making a roof that from its very nature, cannot decay or disintegrate.

Moreover, asbestos cannot burn. That is why the Underwriters' Laboratories, Inc., give to Asbestos Roofing the highest rating, equalled only by metal, slate or tile.

Johns-Manville Asbestos Roofings have never wavered in quality and never will. The ownership of our own asbestos mines gives us the high grade material needed to insure the quality of a finished product worthy of the name Johns-Manville.

All Johns-Manville Asbestos Roofing is backed by Johns-Manville Service and Responsibility. Through our Roofing Registration Service we are able to keep in touch with Johns-Manville Roofing in Service. This is your assurance that it will give the service claimed for it.

**Asbestos Shingles are made of Asbestos Fibres and Portland Cement. Asbestos Shingles improve with age, as they take on a harder set year after year.*

This book tells very plainly about all types of roofing

It is an unbiased explanation as to what goes into each kind of roofing from the standpoint of a manufacturer who makes all kinds. Sent promptly on request.

EDITORIAL COMMENT

A PERSON who thinks that no other business than farming experiences losses or sells its commodities below the cost of production is mistaken. If all other business enterprises made a profit all the time, there would be no failures. However, there are hundreds of failures each year among merchants and manufacturers. It is a common trait of men to feel that they are engaged in the only industry that is experiencing hardships and that the work of others is easier, more inviting and yields greater profit.

MINNESOTA'S DAIRY PRODUCTS

It has been estimated by Chris. Heen, Dairy and Food Commissioner of Minnesota, that the increased production of dairy products in his state for the year 1920 will amount to $22,000,000. Minnesota's income from dairy products in 1919 amounted to $133,708,555 and it is anticipated that this year it will be $155,000,000. The big gain has come through the increased production of butter. Minnesota is the leading butter producing state in the Union and in 1919 her butter brought $80,875,676. The total value of cheese was but $2,909,655. She produced a good quality of butter but it has been estimated that owing to poor quality of butter one county last year lost $22,000 and another county over $100,000. Farmers who desire to get the most out of their milk should appreciate that quality plays a big part in getting the best market price. The buttermaker must have a good quality of milk and cream if he is to turn out a grade of butter that will sell at the best price.

We presume every county in Minnesota last year lost money because of the low quality of butter produced, but so far as we know attempt was made in only two counties to estimate the loss. What a fuss these patrons would have made if they had been cheated out of this amount of money through failure to pay for some of their butter or by some other scheme! A loss inflicted upon themselves never seems so bad, especially when it is by the indirect route.

THE CONTAGION WAS BURIED

"The heifer is disposed of and the contagion buried."

Such was a part of the comment we made six months ago concerning the first reactor found in the Hoard's Dairyman herd in twenty years of testing for tuberculosis. Many of our friends were concerned over this and they were led to question whether tuberculin testing was desirable, therefore the sequel to this is now presented.

Last week our herd was retested, including every animal from littlest calf to matronly cow. To make doubly certain, the three tests were applied—the opthalmic, the intradermal, and the subcutaneous. The result was no surprise, but it is most satisfactory to know that no reactor was found and the herd is now back on the accredited list.

We give these results, personal as they are, in order to emphasize again the value of continuous and regular testing for tuberculosis. We had good reason to feel safe years ago, for the only animals introduced into the herd were tuberculin tested bulls from tuberculosis free herds. We had tested long enough to feel certain we had none of this insidious disease in our herd, yet year after year we continued to test against the chance infection that might come in unaware and without notice. Last May the test showed that tuberculosis had gained admittance, how, we do not know—possibly with purchased feed, possibly it was brought by a tramp dog, possibly by some chance visitor, or in any one of many other undiscoverable ways.

But, continuous testing year after year discovered tuberculosis before it had opportunity to spread, and the contagion was buried at once. What might have happened if we had not tested we do not like to think. Instead of the one heifer, we might have lost several, and the herd that has been built up through trial and tribulation might have been wrecked. The annual test has not cost much, but failure to test might well have cost us thousands of dollars and in addition might have wiped out a life-time endeavor to improve quality in our herd.

All these things are so personal that it was with hesitation that we made the first announcement and that we now recount the sequel. What has been said is offered to the readers of Hoard's Dairyman that they may profit by our experience. Tuberculosis is insidious and it is costly. Only by eternal vigilance will its ravages be reduced to the minimum. Our best weapons are the tuberculin test, the accredited herd plan, good light and ventilation, and sincerity in care and attention to health standards.

MARKETING FARM PRODUCTS

Complaining of conditions and of bad practices in the selling of agricultural products and of the wrong methods of arriving at the prices of farm products does not lead to their solution. Enough has been said to show the necessity of farmers having a larger part in the marketing of their products and arriving at their prices.

It is no small task for the farmer to provide storage and secure credit so that his products will not have to be marketed at the time of their harvest. It requires a business organization in the hands of capable men if the farmer expects to establish the practice of placing his products on the market as they are needed for consumption.

In many dairy sections there is opportunity to establish a cheese federation so that fifty, one hundred, or more cheese factories can unite and build a large storage where the cheese can be cured under proper conditions and marketed direct to the wholesalers and retailers of cheese. The creameries have an opportunity to federate for the purpose of standardizing their butter and marketing it under a brand. In sections where market milk is largely produced there is opportunity to develop cheese factories for the making of special kinds of cheese, like Roquefort and Swiss, and to manufacture various products from whey and skimmilk. There is opportunity to turn a considerable amount of the so-called market milk into a high grade of butter and sell it at a special price. It would not be expecting too much to get, at least, 10c more than the highest quotations for the best quality of butter now produced. We were recently advised of a large creamery company whose entire production of butter is selling for 10c a pound more than some of the large creameries are receiving. Then there is also the opportunity of building storage for the various kinds of farm products; this will place the farmer in position to market everything he produces when it will pay him the most money. But this will require organization on his part. It would not be necessary that all farm products are sold co-operatively, but the farmer will never be satisfied with our present system of marketing unless he places himself in position to sell his products to the best advantage and knows what they are worth in the market.

PRICES OF FARM PRODUCTS DECLINE

For some time there has been concerted action to reduce the prices of all commodities, and it would seem that the drive has been especially aimed at farm products. At any rate, they have declined faster than other commodities. We do not see the logic of those engaged in this endeavor, for we have not an over-supply of farm products. We are comfortably well supplied with the necessities of life, and it is highly desirable that our food supply be maintained. The farmers have worked hard to produce the present crop and our larders are again well supplied. To attempt to drive down the prices of farm products is to lessen production in the future and we fear this is not desirable. Strange as it may seem, it was only last spring that many of the leading men of our country thought famine was ahead of us. The prices of farm products were sufficiently high to stimulate the farmer doing his best and he did. Now we have an adequate supply of farm products. It is not wise for our future nor just to those who have put forth the effort to get this supply to attempt to so reduce prices that they will not return the cost of production.

Last spring the farmers planted potatoes, and the seed was worth $5.00 a bushel. It required about 12 bushels of seed per acre, so the seed cost amounted to $60. The present price of potatoes is about 75c a bushel. No farmer can afford, with the present price of land and labor and with seed costing $5 a bushel, to plant potatoes and risk getting a crop when they only return him 75c a bushel. The consumer should understand this. The next year's acreage of potatoes is not likely to be so large and the prices may be far too high, which is also bad. It is unfortunate that the prices of farm products cannot be stabilized, for we believe it would be an advantage to both the producer and the consumer. We must be ready to abide by the law of supply and demand. It is the most satisfactory way of regulating prices, but we do object when there is concerted action upon the part of the government or men to drive down the prices as it jeopardizes the future supply of our food and causes heavy losses to the producer.

THE PRICE OF MILK

"The Price of Milk" is the title of a new book by Professor Clyde L. King, who has gained an enviable reputation among both producers and consumers as arbitrator of milk prices in Philadelphia. It has already established its place beside "Feeds and Feeding", "Dairy Cattle and Milk Production", and the few other books that are a constant source of help for the seeker after reliable information on dairy questions. The discussion of the subject is sane and reasonable. The author has gathered together much of the investigational work that has been done, discusses it in an intelligent manner, and makes a direct and concrete application that will be of immediate and direct service to producers, distributors, and consumers of milk everywhere.

Robert W. Balderston, the efficient secretary of the Interstate (Philadelphia) Milk Producers' Association, says: "As a milk producer myself and secretary of an organization of milk producers I want to commend this volume to all milk producers everywhere as a book that will help them in making the decisions they must make in marketing their milk." We also commend this new volume to every person interested in the milk problem. It discusses the economics underlying and affecting the price of milk, as also the costs of production, distribution, and manufacture. It is an unusual book in that it discusses a technical subject thoroughly and in such manner as to be valuable to the student, but at the same time the data is so well selected and so clearly presented that the lay reader can not only understand but his interest and attention is immediately aroused. The book is both reliable and readable.

If producers are to protect themselves in the markets and understand their problems so they can apply the right principles of marketing, they must know why the general public is interested in milk, what forces fix prices and their relationship, what are the various systems of arriving at costs of production and distribution, and the different forms of producer-marketing organizations. These subjects are discussed in "The Price of Milk", as well as other related subjects, such as the value of milk in the diet, collective bargaining, dairy statistics, fair price policies, etc.

Germinating Hard Seed

Referring to the article by A. L. Stone in your issue of July 30, "Hard Seeds in Legumes", permit me to suggest that here on Cherokee Farms we find that clover and other leguminous seeds that are gathered after they are all thoroughly ripe are practically all hard, but gathered when the seed pods are still partly green nearly all are soft and will germinate quickly. We have also found that by sowing hard Bur clover seed in June or July it will make a good stand in November, but if not sown until September or October it frequently fails to germinate at all.

We also find that beggar-weed seed does not germinate until it has laid in the ground at least a year. Because of this long period of germination of beggar-weed seed we sow it every year at the last cultivation of the corn and when the corn is off we turn the seed and stubble under. By plowing again in the spring at about the same depth or a little more the beggar-weed seed germinates and makes a fine crop of hay after the corn is laid by. About every third year we turn the whole crop of beggar-weed seed under so that by this simple rotation we are able to raise corn every year on the same land.

Would it be possible to sow alfalfa and red clover late in the fall and plow it under and by plowing again at a little greater depth in the spring bring the seed to the surface and get a good stand?

Monticello, Fla. C. F. L.

This question may be answered in the affirmative provided the process is properly carried out. This must be taken into consideration, however, that in plowing this seed under it will be distributed at various depths in the furrow, some of it being thrown to the bottom of the furrow, a portion of it on the surface or very close to it, and another portion at varying depths between the bottom of the furrow and the surface of the soil. This means that when the field is plowed there will be at least a portion of the seed buried so deeply that it cannot reach the surface. In order to obtain a good stand by this process it would probably be necessary to use considerably more seed than if it were sown under normal conditions. Except for the fact that the seed would be moistened to some extent and perhaps be in better condition to start a rapid growth in the spring there would seem to be no particular advantage in this program. Under conditions where the temperature is high and the moisture sufficient it would probably be fully as satisfactory to seed the clover and alfalfa in the spring. The only argument for the proposed method would be a possible improvement of the soil condition by the double plowing.

Wis. College of Agriculture. A. L. STONE.

Ration With Alfalfa—Silo For Four Cows

In figuring dairy rations nowadays I suppose the Wolff-Lehman standards are almost completely ignored. Would you say that the Haecker standard is a reliable guide at present or would you suggest working with some other standard mentioned in "Feeds and Feeding"? Alfalfa hay is the only feed I have and no silo. Could you suggest a grain ration for these cows without any silage or beet pulp or mangels?

I have only 15 acres with a small pond at one end. Do you think this would keep 4 cows if I put up a small silo?

I have just put a cement floor in the barn. Would you suggest covering the cow stalls with boards or would it be safe without?

Waukesha, Wis. H. F. S.

In our own computation of dairy rations, we use the Haecker standard and have found it very satisfactory. The old Wolff-Lehman standards are not now in use, but the modification of this standard as suggested by the authors of "Feeds and Feeding", is very satisfactory in computing rations. There are others who use the Armsby energy standard which they consider somewhat superior. This latter method, however, is used more largely in the East.

There are various combinations of grain which will go very well with alfalfa hay as the sole roughage. Among these we list the following:

400 lbs. corn meal, 100 lbs. cottonseed meal, 100 lbs. gluten feed, and 100 lbs. wheat bran.

400 lbs. corn meal, 200 lbs. gluten feed, 200 lbs. old process linseed meal, 100 lbs. ground oats.

300 lbs. corn and cob meal, 200 lbs. gluten feed, 100 lbs. cottonseed meal, and 100 lbs. wheat bran.

100 lbs. corn meal, 100 lbs. old process linseed meal, 100 lbs. ground oats.

Cows will not eat ordinarily to exceed 30 lbs. of alfalfa hay when this is the sole feed which they secure. This method of feeding is followed to a considerable extent in California where alfalfa is relatively cheap in price and in very large supply. Dairymen in the Middlewest states find it more profitable to supplement alfalfa hay with grain and reduce the quantity of alfalfa. It is said that where alfalfa costs more than 40 per cent of the average cost of a grain mixture, it is not profitable to make it the exclusive feed. We would not feed to exceed 10 to 15 lbs. of alfalfa, supplementing this with one of the grain mixtures mentioned at the rate of, say, 4 lbs. of grain per day to cows producing less than 20 lbs. of milk and increasing the grain fed by one pound for each 3½ to 4 lbs. of milk produced over 20 lbs. This amount of feed should be varied according to the use which the cow is making of it. If she tends to become overly fat and fails to increase in milk flow consistently, then we would cut down the amount of grain, and vice-versa.

We do not advise the erection of a silo for herds of less than 10 animals. This is because of the difficulty of removing enough silage each day to keep the silage from excessive spoilage. It would be more profitable to raise rutabagas or mangles as the succulent feed. This entails somewhat more labor but we believe in the long run it will prove more profitable. The fifteen acres should easily support four cows and their young stock.

While it is preferable to cover the cement platform upon which the cows stand, yet this is not at all necessary and is not done by the majority of farmers. The best covering is either cork brick or creosoted wood block, but there is no reason why planks may not prove fairly satisfactory.

Small Pits for Storing Root Crops

HOARD'S DAIRYMAN:—There is more occasion this fall for the construction of root pits to help out in taking care of surplus crops raised this year than in several years past. If the pit is constructed and taken care of right, there need be no fear of the danger of the crop freezing or rotting. Likewise there is no evident depreciation in quality. We have seen, in several cases where pits have been opened during March and April, the crops stored therein were as fresh and as sweet as on the day when the crop was put in.

The size of the pit, of course, depends on the quantity of crop to be stored. One can best judge the size of pit by the heap of the crop to be "pitted". A pit to store 60 bushels of potatoes or roots can be made in the following manner: Measure off, preferably, a circle of five feet in diameter and excavate five feet, leaving the bottom flat. Place a layer of dry straw about six inches deep at the bottom. Then fill with potatoes or roots up to within a foot of the top.

Next, cover the top with about ten inches of dry straw well packed. Place inch board cover over this leaving air space from one to two inches. The cover to rest on supports close in to the wall of the pit. It is best to have air space between the crop and the board cover. Quite frequently no allowance is made for air space in pits. Cover with dirt to about two feet deep overlapping about two feet outside of the pit and round up at center to conical shaped body. As the days lengthen and the cold weather strengthens, gradually heap up a little more dirt until about three feet depth is reached. Always select a high, well drained spot, easily accessible to the home.

In April or May when the pit is opened, the crop appears fresh and as vigorous as when "pitted" in the fall. There is little or no loss in moisture. It is stored under even temperature practically and the intermittent freezes and thaws in no way affect the contents of the pit. A pit requires no particular skill in planning it. It requires no outlay of money for materials and construction. It is the best thing to save potatoes or root crops, where no better means for storage are available.

Wisconsin. J. F. WOJTA.

Registering Grades—Inbreeding

Can a grade cow be bred to a registered bull and her calf be bred to the same kind of a bull and so on for enough crosses to make the resulting cross entitled to registration? What is the general opinion among good breeders of the practice of inbreeding? How far is it safe to follow?

Red Lake, N. M. R. B. S.

In order to be eligible to registry an animal must have both parents already entered in the registry books of the particular breed to which it belongs. The offspring of a grade cow mated to a pure-bred and registered bull can never be registered in any of our dairy breed associations, no matter how many crosses of pure-bred sires are used. After a certain number of crosses the Shorthorn herd book of England will admit animals after examination. In America, however, this is not accepted.

Inbreeding is one of the most efficient measures of improving dairy stock, but in like manner it is a most dangerous thing to be handled by the average breeder who is not fully informed. Inbreeding not only emphasizes the good qualities of the animals mated but it will in like measure emphasize the weaknesses and the bad qualities of these animals. There is also danger of producing less vigorous offspring unless care is exercised.

There is some less danger of inbreeding where a pure-bred bull is used upon grade cattle, for there is less likelihood of the same blood strains predominating. We would hesitate to advise even this except in the case where the sire has proven himself potent in passing on dairy qualities to his offspring and is himself an excellent individual. In these cases, we would not hesitate to breed a daughter to her sire or to a half brother, or other close relation. As a choice between a nearly related sire of good quality and an unrelated sire of inferior quality, we would choose the former.

Sorghum Fodder for Cows

I have been told by some milk men here that sorghum fodder with the seed on will dry up milk cows. As I have sorghum that has about four bushels of seed to the ton, will you tell me if it is safe to feed?

Meno, Okla. A. B. M.

Sorghum fodder with the seed on will make a good feed for cows and we know of no reason why it should cause them to dry up. It is more than likely that the drying up of the cows is due to insufficient feeding rather than to the sorghum seed itself. If not fed with legume hay and a good grain mixture, we would expect sorghum fodder to dry up cows. This is not because eating the seed dries up the cows, but merely because the cows are not getting enough milk making feed.

If this fodder is properly supplemented with good legume hay and a sufficient grain allowance, there is no reason why the cows should not do very well. It is understood, of course, that sorghum fodder, like corn fodder, is not the best feed for dairy cattle. It does not provide the succulence in the ration as does silage and we would not expect quite as good results from its feeding as from feeding silage.

The sorghum seed itself is very hard and somewhat indigestible unless ground. Indeed, grinding nearly doubles the value of this seed as feed, and when ground it is considered to have four-fifths the value of ground corn.

Relative Production of Heifers and Cows

When one is breeding up Holstein grade cows for production with 8,000 lbs. per year as the minimum below which no mature cows are to be kept, what would you consider the minimum yearly production for heifers freshening first time at from 24 to 30 months?

Morrisville, N. Y. A. L. B.

It is generally estimated that a two-year-old heifer will produce during her first period of lactation about 70 per cent of her mature production. As a three-year-old her production will be 80 per cent of her mature record and at four years, 90 per cent. These figures, of course, are merely averages and may not apply to individuals. There is also the consideration that must always be taken into account as to whether the first record made was made under fairly satisfactory conditions. We would hesitate to eliminate a heifer of good breeding and fair promise upon the basis of just one year's performance.

Johnson Grass for Illinois

Is Johnson grass good pasture? Will stock do well on it and do they like it? Will it stand Illinois freezing and frequent overflows?

Fairfield, Ill. T. J. H.

Johnson grass is not thought to be a very good pasture grass even in the South where it flourishes. It is more often made into hay and is considered a fair hay crop and fairly satisfactory as a dry roughage for cows. We question whether it would be suitable to conditions existing in Illinois, as it is essentially a southern plant. In the South, it is one of the most persistent weeds they have in their cotton fields. We have not heard of its adaptation to northern or semi-northern conditions.

What Does Your Feed Cost Per COW?

What does it cost you to feed your cows? It depends entirely on **how** and **what** you feed them. The only way you can figure feed costs is to deduct the cost of feed from the value of milk production.

If you feed your cows sparingly and try to economize on feed, your feed costs will be high because the first use made of the feed your cows consume goes to provide bodily maintenance and leaves little for milk production.

But if you feed the **right kind** of feed liberally—give your cows sufficient to provide them with both bodily maintenance and milk producing nutrients, your feed cost will be low. That's why

SCHUMACHER FEED AND BIG "Q" DAIRY RATION

fed according to the Schumacher Feeding Plan have become so universally popular with dairymen and farmers everywhere.

Schumacher Feed, the world's greatest carbohydrate feed is composed of the **right** kind and variety of grains to supply bodily maintenance—to keep cows in tip top shape physically—provide them with energy—stamina, etc. while Big "Q" Dairy Ration, the renowned high quality protein ration, supplies the needed food nutrients to be converted into milk.

This combination fed liberally **reduces feeding costs** because it **increases health condition and milk** production. You can prove it to your own satisfaction and profit by making a test with any cow. The results will be gratifying and make you a strong advocate of the Schumacher Feeding Plan—the plan that costs less because it produces more. Ask your feed dealer

Empire Oil-Burning Tank Heater

Greatest improvement ever made in tank heaters. Fits any tank. Burns from 14 to 16 hours on one gallon of kerosene. Any child can operate it with safety; no sparks, ashes or smoke. The heating chamber is entirely under water; no heat wasted. Guaranteed. Saves feed—pays for itself repeatedly.

Empire Non-FreezableHogWaterer

Made of heavy galvanized iron—large capacity (70 gal.); drinking trough on outside where hogs can reach it; oil burner directly under trough—guaranteed not to freeze. Keepe water warm at a small cost. An abundance of fresh, clean water at right temperature. Keeps hogs healthy—fatten faster on the same feed.

FARMER AGENTS

Special offer to farmers willing to show our Heater and Waterer to prospective buyers. Write at once for price and special offer. Buy direct from factory.

Practical Community Dairy Work in Arkansas

The schools of vocational agriculture in Arkansas are preaching the doctrine of "Better farm practice, better farm business, and better farm living." This, of course, means more dairying, better dairy cows, and better dairy practice. W. L. Hall, agricultural instructor at Rogers, Ark., has not only been preaching the above doctrine, but he is able to report a number of converts to the faith.

Something over a year ago Mr. Hall was employed to teach vocational agriculture in the Rogers school and, according to the Arkansas plan, he made a thorough community survey and from this survey formulated a problem to be solved by the adult farmers in a part-time and evening school. The problem that Mr. Hall proposed and which he offered to assist in solving was the improvement of the dairy herds in and around Rogers. This section of Arkansas is known far and wide as one of the choice fruit sections of the United States. Much attention has been given to this phase of farming and the farmers are well versed in pruning, spraying, and marketing of fruit, but they had neglected, in their zeal for apple culture, another industry that in Mr. Hall's judgment would be equally as profitable and that would fit in most admirably with fruit growing. Community meetings were held. The advantages of dairying for Northwest Arkansas were explained. Dairy specialists from the agricultural extension department of the University gave their testimony and advice with the result that a cow testing association and a co-operative sire club were organized. To make this co-operative association the most effective possible, Mr. Hall spent a part of the past summer in the state of Wisconsin studying the methods of the cow testing associations in that state, and from the knowledge gained there he formulated a workable plan for his community. This plan contemplates the keeping of dairy records the same as any cow testing association makes keep, but instead of a regular cow tester employed by the farmers, the tests will be made and the records kept by Mr. Hall and his students in vocational agriculture. This work in testing the cows and keeping the records by the students will receive credit in the regular agricultural course in the Rogers school, and the regular meeting of the association will constitute an evening school for adult farmers. Along with the cow testing association the farmers are studying the marketing problem and a movement is under way for a co-operative marketing association that will save money to the farmers in both the purchase of concentrates and dairy supplies and the selling of the cream.

"It is the duty of the agricultural teacher, as I see it," said Mr. Hall, "to make a thorough study of his community, discover the agricultural needs, then, through co-operation with the farmers and all other available agencies, to satisfy this need." Mr. Hall is doing this in the Rogers community.

Arkansas. E. B. MATTHEW.

THESE PURE-BRED JERSEYS ARE PROVING THEIR WORTH TO THE MEMBERS OF THE COW TESTING ASSOCIATION OF ROGERS, ARK.

The Milking Machine Operator

HOARD'S DAIRYMAN:—One of our largest dairy farmers observed the other day that as soon as labor becomes available on the farm there will be milking machines of the second hand variety for sale at any old price. This farmer has been having some trouble with his machine, as one would expect from the remark. It rather looks as though a half or more than half of the owners of milkers might say, "that's so", when they hear that remark, yet a fair proportion of those who say it would keep the machines.

When you come to study this machine question it comes down to the point of the operator. It is about as necessary for the farmer to take charge of the machine as it is for him to do most of the milking when that is done by hand. Even then there is a good big difference in men. Some farmers of the best type are not particularly good at handling machinery. Indeed, it seldom happens that a man excels in all lines and possibly the greater talent he displays in some one line the less we may expect in some others. True, the farmer is an all round man, but superiority in all lines is not to be expected.

The hired man of today is, commonly speaking, inferior to the one of ten years ago. There are some good ones and a few who will handle the milker as well as the employer, but these are not the rule. If I were a milker manufacturer I would wish my machines placed with a farmer who would operate his own outfit. Even then it would fall into the hands of an inefficient operator now and then.

We have found that two double units are about as many as one man can use with real profit. In a twenty cow dairy one can be used with real advantage, but after a somewhat extended experience we believe that two such units fill the bill better, even with sixteen cows.

Then you want to know your cows. There is more difference in cows than in machines and just as much as in men. Some cows are nervous and fidgety and can't help it. Some milk hard and some easy. Some are uneven, many have quarters that need set-

cial attention. All this is up to the operator. Not every Tom, Dick, and Harry can handle the situation.

New York. H. H. LYON.

Are Concrete Stave Silos Durable?

HOARD'S DAIRYMAN:—The proverbial "lightning against black-gum" has found a more modern equivalent in the substitution of "concrete silo" for the obdurate tree. Here is a photograph of two of a battery of four 110-ton concrete stave silos on the Cox-

LIGHTNING STRUCK THESE CONCRETE STAVE SILOS

Alexander plantation, near Pine Bluff, Arkansas. Do they look as though lightnin' had struck 'em?

They don't.

Three years ago a bolt of lightning made a drastic test of their stamina by striking them both fairly and squarely. Some chunks of concrete were knocked from each, most of the damage being done about the door openings.

No trace of cracks can be found in either silo, and Mr. Cox, who repaired the damage, had great difficulty in pointing out the scars. Less than one sack of cement was used in making needed repairs.

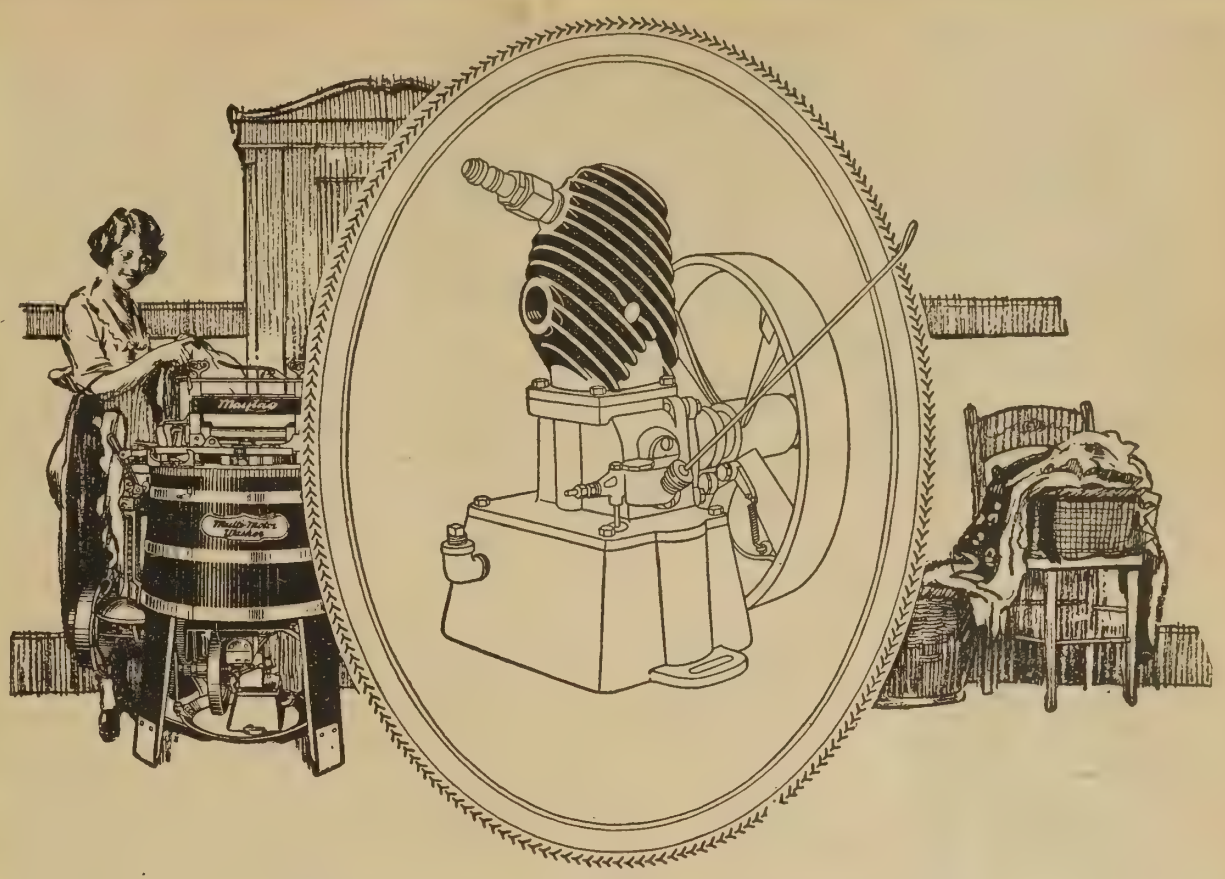
Arkansas. DAVID THIBAULT.

Talking in Cow Stable

HOARD'S DAIRYMAN:—"Should the milkers talk in the stable while the herd is being milked?" That is one of the questions I have heard asked rather often as I've been making my rounds as an official tester. I have been in barns where 40 cows stood and not a word was said above a whisper during the milking time. And I've been in dozens of them where the milkers and feeders sang and whistled just as they pleased. I've also been in the stables where the workers talked quietly to each other and to the cows.

As to the effect—and that is what governed all of them—I can see no difference particularly but it looks to me as though anything is the right plan that is not strange to the cows. Entire quiet is not natural. While outside the men talk to each other and laugh and whistle. In the barn they are absolutely quiet. What does the cow think?—if she thinks. If she is inclined to be a bit nervous I believe she will have her ears all set for something to turn up unexpectedly. If it does not, all is fairly well except that she is on edge—nervously—and can't do her very best in the pail.

On the other hand, I think it is an extreme just as bad to have a barn filled with shouting and swearing at milking time. This strikes a nervous cow just as hard as the extreme quiet, I believe. I've been in such barns sometimes and very good cows have been there with very satisfactory records but yet I always felt that they could have been better.



One of the things that I don't like to see and I know the cows object to, is the presence of small children with wagons, tricycles, or other playthings in the barn. It is annoying to the milkers and also to the cows. The noise made by the youngsters and their playthings is unexpected and at times startles a cow until there can be nothing less than an effect on her milk production. Large dogs can and do have the same effect on the nervous cow. If these things have to be tolerated let them be at some other time than milking time.

The ideal condition at the barn during milking, it seems to me, is a natural noise caused by talking by the men and talking to the cows. A milker surely doesn't lose anything at the pail if he speaks a word or two to the cow he is milking. No matter what he says, even if no more than her name, but say something. The chances are that the cow will see the milker when he approaches but she might not and in that case there is a little startled feeling that does more or less harm. Surely, our cows are not so touchy, however, that one milker may not talk to another in a normal tone of voice without causing any injury to the production.

Everything about the barn and everything in the usual order has always seemed to me to get the best results. Some herdsmen are so particular that they have a certain time to milk a cow. If they were at the barn two minutes before time they would stand idle for two minutes before starting to milk. Regular milking hours are expected by the cow and she appreciates them seemingly. Yet, two minutes for a cow's clock is getting it down rather fine. I believe it is far more important to not vary the order of milking than not to vary the time a few minutes. Cows notice that readily and will be upset nervously if their turn is missed. I have seen this done as a test and there is every evidence that the missed cow knows there is something wrong. She sometimes will partly leave her feeding and wait for the milker to get at her when he should.

Ohio. EARL ROGERS.

The Power Behind The Multi-Motor Washer

This is an illustration of the wonderful little air-cooled gasoline engine which operates the Maytag Multi-Motor Washer. It has brought convenience and relief to thousands of women whose homes are not equipped with electricity.

Because this little power plant is built right into the washer, the Maytag Multi-Motor is really a portable machine. It is all-sufficient — dependent upon no outside source for power. It will do your washing wherever you move it — in the cellar or kitchen, in the shed — on the porch or out under a tree. Thus it has an advantage over even the finest electric machine.

Merely fill the tub with water, soap and soiled clothes. Flip the starting wheel with your foot. When the clothes are finished, feed them through the power wringer — hang up and — wash day is over. The Maytag Multi-Motor costs little to buy and to operate. Why be without? See the local Maytag dealer. If you do not know him, write us.

Heredity and Prodnction

(Continued from first page.)

ed will not nick well, and consequently good results will not be secured.

"Such terms as 'blood harmonizing', 'cold blood', 'warm blood', and so on, are terms that are commonly used in connection with the term 'nick', giving the impression that the inheritable characters are carried in the blood. Such is not the case.

"When two animals are mated and good offspring are secured, it is said that these two animals, or the families they represent, 'nick' well. If the result of the mating is undesirable, the animals do not 'nick' well. We frequently see the statement that the bulls of a certain line of breeding have been found to nick well with all families, or with certain families. The real question which underlies nicking, as I understand it, is this: Are the factors governing milk and butterfat production that enable Fauvic's Prince to sire daughters with great producing ability, the same factors or combination of factors that enable Golden Glow's Chief to sire great producing daughters?

"It has been demonstrated that one pair of Guinea pigs of certain colors may be mated and get offspring of a certain color. Another pair of Guinea pigs, of different colors than the first pair, may be mated and get offspring of the same color as the offspring of the first pair. The color factors in the first pair were undoutedly different from the color factors in the second pair, but the result of the combination of these different sets of factors is the same. If the combination of factors governing production that makes one bull a sire of great producing cows is different from the factors that make another bull a sire of great producing cows, then it is not difficult to conceive of failure resulting from the mating of the first sire with the second sire's daughters. If the factors that enable one bull to be a great sire of dairy production are entirely different from the factors that enable the second bull to be a great sire, and the two sets of factors are brought together, the reaction of the two sets may result unfavorably and therefore the animals may not nick. If, however, the factors that enable one bull to be a great sire of producing ability daughters are the same as those which enable any great sire to be such, then any great sire may be mated with the daughters of another great sire of the same breed, with the expectation of securing good results.

"Let us suppose that those two great Jersey sires, Fauvic's Prince and Golden Glow's Chief, have equally great ability as sires of production and type, but are unrelated. The question is, will an animal of the following breeding:

No. 1. { Fauvic's Prince / (Dam) / Fauvic's Prince }

be likely to have greater ability as a sire than an animal of the following breeding:

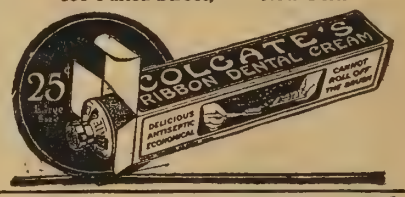
No. 2. { Fauvic's Prince / (Dam) / Golden Glow's Chief }

"Aside from the questions of the effect of inbreeding on constitutional vigor and fertility, no reason is known why the animal of No. 2 breeding should not be as desirable as the animal of No. 1 breeding, unless it be that the factors which cause Fauvic's Prince to be a sire of great producing animals are different from the factors that enable Golden Glow's Chief to be a sire of great producing animals. If the breeding ability of Golden Glow's

COLGATE'S RIBBON DENTAL CREAM

At Bedtime

WHEN you go to bed with teeth unbrushed, you give germs an eight-hour start on their work of destruction.



Those teeth enemies are most active while you sleep, because they can work undisturbed between the teeth where particles of food may remain.

So clean your teeth with Colgate's Ribbon Dental Cream every night. Use Colgate's every morning, too—safe, sane, and deliciously flavored.

Chief was unknown, then the animal of No. 1 breeding would be preferable, because we know that Fauvic's Prince is a great breeding sire, and his second appearance in the pedigree as sire of the dam eliminates the possibility of some undesirable breeding animal appearing there and representing 25 per cent of No. 1's ancestry.

"If the factors that enable these two bulls to be sires of great producing animals are different, it is very important that we should know to what degree of relationship they are different—or, let us say, how distantly related the animals that are mated may be, and still have like factors relative to producing ability.

"If the factors that enable these two bulls to be sires of great production are the same, then it is a question of mating animals within a breed, all of whose sires and dams for three or four generations have proved by their breeding records that they have the combination of factors that enable them to be great producers and transmitters of production, and also the factors that enable them to have and to transmit desirable type. When we mate animals with ancestry that comes up to these requireback to sires of the same kind of breeding, we will be securing animals which will not revert back to low production and undesirable type, and we will secure a large percentage of sires who will be prepotent in impressing these desirable characters on their offspring, even though the dams they are mated with are not so well bred.

"The question of whether or not the factors that enable one bull to be a great sire are the same as those that enable another bull of the same breed to be a great sire, is an extremely important one. We hope that our researches of dairy cattle breeding problems will throw some light on this point.

"I believe that the man who will make the greatest progress in breeding dairy cattle is the man who has complete knowledge of the ability of the ancestry of the animals he is working with to transmit great production and to transmit desirable type, and who will mate only such animals as have ancestry that comes up to these requirements—or if he can not mate animals, both of which have proven ancestry, he will use for generation after generation only such sires as have proved by their breeding records that they have the combination of factors that will enable them to transmit high production and also desirable type."

The more farm products sold near home the less demands on an overburdened transportation system.

The "Meierei"

(Continued from page 788)

ford to pay for comfort, courting discomfort.

Those Tinkling Bells

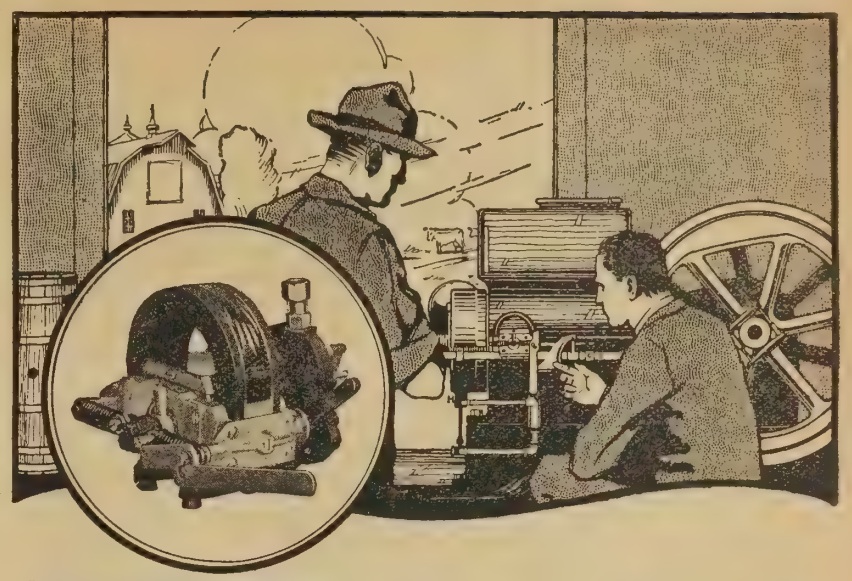
Half the pleasure in being at the meierei is centered in the surroundings. Instead of a small orchestra, which would be entirely out of place, appropriate music is provided by the tinkling bells of the animals which browse contentedly in the neighboring meadows. The picturesque whitewashed, slate-roofed building is more or less surrounded by thick woods, where Hansel and Gretel might have lost themselves, and which are full of ever-changing light and shade. The fields surrounding the meierei are gay with all the wonderful flowers which flourish six thousand feet above the sea-level, and the intense blue of the lake, a blue which sometimes turns to an unforgettable green, reflects the Alpine glow. Nearby are the mountains, eternally snow-capped, and towering in lordly magnificence.

From time to time you may hear a merry peasant yodelling his way home. The yodeller, however, does not cultivate this strange art with the zest of former days. Some yodellers, in fact, are so lost to all sense of the fitness of things that they prefer the mouth-organ to the yodel. That they should be allowed near the meierei is a blot upon Switzerland's escutcheon.

Creamery Bookkeeping

The Bureau of Markets has just issued Bulletin No. 865, entitled "A Classification of Ledger Accounts for Creameries."

This publication sets forth the ledger accounts which should be kept by the average creamery and describes in detail the manner in which each account should be kept. It also explains a number of the business and accounting practices incident to creamery operation, concerning which there now exists considerable confusion and misunderstanding.



The bulletin is arranged to serve as a handbook for the creamery bookkeeper or manager, and will be a valuable guide in assisting him correctly to open and to keep an adequate set of books. It will be especially valuable as a guide in closing the books and preparing the Income and Expense Statement and Balance Sheet, forms of each being shown in the bulletin.

Bulletin No. 865 will be sent free on request to the Bureau of Markets, Washington, D. C.

MONOBELLE, A SEVEN-YEAR-OLD GUERNSEY OWNED BY F. L. HOWES OF MASSACHUSETTS

She has recently completed a splendid official record of 16,724.5 pounds milk, 847.64 pounds fat. This production exceeds her requirements for entering the Advanced Register by 135 per cent. She has a previous record completed in Class B of 11,209.6 pounds milk, 546.61 pounds fat. She was bred by Joseph A. Blake, Connecticut, and dropped June 3, 1912. Her sire is Bell-founder, a bull whose daughters have been making outstanding records in Falcon's Flight Herd, Connecticut.

WEBSTER MAGNETO *Service is Not a Repair Service*

A *Webster* Magneto seldom needs repairs. But, like many other well-built products, it renders fault-free service only in proportion to the way it is handled.

Therefore, *Webster* service is primarily an educational service—*not a repair service.* The industry of 46 *Webster* service stations and a corps of *Webster* service men is constantly and solely devoted to this three-fold purpose:

—confirming to the manufacturer, by actual performance, the claim that Webster interest in Webster Magnetos never ceases:

—demonstrating to the farm engine dealer the value of the Webster Magneto as a selling asset:

—helping users of Webster-equipped engines to get the highest possible ignition efficiency from their engines.

The 600,000 *Webster* Magnetos now in daily use and the fact that they are now supplied as standard equipment by 85% of the manufacturers of farm engines using make-and-break ignition, proves beyond all doubt the correctness of *Webster* theory and the thoroughness of *Webster* construction.

When you buy your next farm engine *insist* that it be *Webster*-equipped for no other ignition will serve you as dependably or as long.

WEBSTER ELECTRIC COMPANY
RACINE, WISCONSIN. U. S. A.

"Kant-Kom-Off" COW BLANKET

This is the original and only Kant-Kom-Off blanket endorsed and used by the most successful live stock breeders. It brings your animals into the show or sales ring in glossy condition. That means more prize ribbons and higher bids. Has no equal as a protection against flies. Milch cows give more milk, stock thrives better when thus protected. An investment that will pay dividends to you.

New Fits-All Show Halter with brass trimmings, adjustable to fit small calf or large bull.

Exclusive Features

The only blanket with hip strap support of leg stay. Cannot lose off or be kicked off. Stays on day and night. Made of best and most durable material and will give you excellent satisfaction. We also manufacture stack and hay cock covers. *Write today for circular and prices.*

R. LAACKE MFG., CO.
Dept. 96 Milwaukee, Wis.

America's Best Show Animals Wear this Blanket.

FRESH WATER FOR EVERY DRINK

The more clean, fresh water a cow consumes the more milk she gives. Make it easy for her to get fresh water.

The ACORN Drinking Bowl

permits her to obtain fresh water by simply poking her nose into the bowl—valve opens automatically giving fresh flow of water. Write for circular.

New York Butter Market

NEW YORK CITY, NOVEMBER 9:—The tone of the butter market is far better than it has been for some time. That is due principally to a quickened demand for medium quality butter and also to the fact that reports do not indicate that large quantities of foreign butter are being exported to this country. Receivers, however, are still inclined to be nervous as they fear that the advances in prices of butter will serve to draw butter to this country. It seems highly improbable that Denmark will ship much butter in the near future, in view of the fact that it has contracted with England for the greater part of its surplus and also that it has been developing markets in Germany, France, and other European countries. It would seem that shippers of Argentine butter must be discouraged regarding the demand for that butter in this country as it is selling at very unsatisfactory prices. The butter is of very inferior quality and has the further disadvantage of being packed in boxes. While the box, or cube, is used successfully on our West Coast, that package meets with no approval in eastern butter markets. Some New Zealand butter has arrived on the Pacific Coast but in small quantities. Rumors regarding shipments of large quantities of that butter seem to have been false.

Hope is expressed by some receivers of butter that with the change of federal administration, a higher tariff may be placed on butter and other dairy products. The duty at the present time is 2½c per pound, whereas before the change of tariff schedules in 1914 it was 6c. There is considerable doubt on the part of some that a higher tariff would have any influence on the quantity of butter being imported. The present value of European exchange seems to favor the shipment of butter to this country. However, very little butter is arriving from foreign sources at present which seems to indicate that an active effort is being made to market the butter where it is more badly needed. It is realized by foreign shippers that our butter market is easily upset and that they are taking considerable risk in shipping the butter in large quantities as that would undoubtedly cause a break which would force them to take a comparatively low price for their butter.

There has been an upward trend to butter prices for fully two weeks. The principal advances have been on fancy butter but medium quality butter has also shown considerable improvement. Low firsts and seconds continue to be a drag on the market. However, there has been more inquiry for the low grades of late than has been known for some time. Receivers are very anxious to dispose of their holdings of such butter as they feel that a break may come at any time which might result in heavy losses. The fact that a high percentage of the Argentine butter which has been received in the last two months remain unsold and is being offered at prices ranging from 40 to 46c is a barrier in the way of disposing of the accumulations of low grade butter which are in the various stores.

On last week Monday, extras were quoted at 61½@62c. Tuesday was a general holiday, but on Wednesday the active demand caused an advance of 1c. On Thursday, there was a similar advance and since that time prices have remained stationary. For the last day or two, there has been less activity but the market remains very firm. Established quotations are: Extras (92 score), 64c; higher scoring than extras, 64½@65c; firsts (90—91 score), 56@62½c; firsts (88—89 score), 48@54c; and seconds (83—87 score), 40@46c.

W. B. LIVERANCE.

Current Feed and Hay Prices

[Report by U. S. Bureau of Markets]

Inquiry for feeds from the country trade during week ending Nov. 6 was even lighter than during the preceding week. The principal demand for wheat feeds for the last few weeks has been from jobbers. It is reported that the output of several of the largest flour mills has been contracted for until the end of December by the jobbing trade, among whom the belief appears general that stocks in the hands of country merchants are low and that prices will be materially higher as soon as a substantial demand from the country develops.

Quotations on bran are: $32 in Minneapolis, $35 in Chicago, $31 in Kansas City, $42 in Atlanta and Philadelphia, $41 in New York, $42 in Boston, and $40 in Seattle. Middlings range from $30 in Minneapolis to $46 in Seattle.

Cottonseed meal seems in ample supply, with prices holding firm without export demand. Hulls and Little Rock are offered at $5 in bulk. Around $38 is asked for 36% meal in the principal southern markets, with $3 to $4 extra for 41% meal. The 41% meal is quoted at $43 in Kansas City, $46 in Minneapolis, $49 in Chicago, and $51.50 in New York.

No improved demand for linseed oil meal is reported at prices $5 to $7 lower than last week in northwestern territory. The northeastern trade is well stocked, with offerings at $49 f. o. b. mill going begging. Quotations are: $52 in Minneapolis, $57.50 in Chicago, $60 in St. Louis, $55 in Philadelphia and New York, $66 in Seattle.

Importers are offering Dutch beet pulp in even weight sacks at $49.50, which shipments which left Europe during October are quoted at $49 f. o. b. New York. Samples of the New Dutch crop expected to arrive in increasing quantities are of excellent quality, light in color, coarse and very absorbent. The prices quoted for domestic pulp are $44 f. o. b. Chicago. Sugar company factories in Minnesota and Iowa are asking $41 demand draft. Domestic production of dried beet pulp is estimated by sugar factories 35% larger than last year. The demand is not so good as it was at this time last year.

Hominy feed advanced $2 over the low prices and is quoted at $33 in Minneapolis, $36 in Chicago and St. Louis, and $45 in Boston. Gluten feed demand is below normal, but prices held steady at around $43.

The hay market continues dull, with producers unwilling to ship at the prices offered. No. 1 timothy is quoted at $23 in Minneapolis, $24 in Kansas City, $32 in Chicago, $36 in Boston, and $43.50 in New York. Mixed hay continues to rule $2 to $4 under these prices, with clover hay at the same or lower price than mixed.

Alfalfa advanced from 50 cents to a dollar under light receipts and small demand. Quotations on No. 1 alfalfa are: $22.50 in Omaha, $27 in Kansas City, $28 in Minneapolis, $30 in Chicago, $31 in Los Angeles, and $33 in Atlanta and Memphis.

Higher Cheese Prices

[Report by U. S Bureau of Markets]

Cheese trading during the week ending Nov. 6 was stimulated by an active demand and markets are now recovering gradually after practically a month of dullness, during a part of which time business became stagnant and prices reached the lowest level for the year. While the reaction has not been so marked as that occurring in butter markets which also suffered a severe slump in October, the improvement seems to be more substantial and is not attended by the unsettled undertone which has kept butter operators rather nervous as prices again approach a high point.

Some dealers, of course, have no faith in the market and are sparing no effort to keep stocks moving in order to avoid any accumulation, but the general report from Wisconsin primary markets is that orders have been readily forthcoming without the necessity of price concessions and, in fact, that prices have been advanced in some instances in order to shut off buying. In view of this condition, the general feeling is that further advances will be in order, especially on some styles for which the demand has been unusually heavy of late. Closing prices for the week rule on the average about ½ to ¾c higher than the previous week.

The average wholesale prices on American cheese (style Twins) for the week ending November 6, 1920, and for the corresponding week last year, were as follows:

	Week ending November 6 1920	1919
New York	27.5	31.8
Chicago	24.2	31.6
Boston	26.0	33.0
San Francisco	26.3	31.3
Wisconsin Boards	23.2	30.9

The total receipts of American cheese at the first four markets were: 2,983,306 lbs., as compared with 3,932,231 lbs. for the corresponding week last year and 2,579,001 lbs. for last week.

Lighter Receipts Hold Butter Markets

[Report by U. S. Bureau of Markets]

Probably the most striking feature of the butter situation this past week has been the sharp decrease in production. This decrease is evident in reports from producing sections, from the shrinkage in total receipts on the markets, and from the smaller number of tubs making up individual shipments. The general development of the market was much the same as that reported for last week, in fact the upward trend was simply a continuation of the recovery previously mentioned. Prices advanced, but for the most part the advances were limited to top scores, although toward the latter part of the week undergrades also began to move. Chicago appeared to be in the best shape of all markets, as not only fine butter but medium grades, including short-field offerings, were cleared early.

In spite of the firmness of the market on fine butter, the very evident falling off in the make and the more active movement of storage butter, the market is still unsettled and nervous in character. Prices are high again, but the sentiment persists that consumption will surely fall off unless prices stay lower. Advances on the various markets were frequently contested. Free offerings of Danish butter at a price under 48½c delivered New York did not help to instill market confidence. Samples of New Zealand butter were also seen on eastern markets, and future arrivals, it is said, will be shipped east for distribution.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending November 6, 1920, and the corresponding week last year, were as follows:

	Week ending November 6 1920	1919
	cents	cents
New York	63.4	69.5
Chicago	61.6	66.3
Philadelphia	63.3	69.0
Boston	59.7	67.0
San Francisco	52.0	63.7

The receipts of butter at these markets were 6,572,023 lbs. as compared with 8,131,694 lbs. for the corresponding week last year and 7,062,005 lbs. for last week.

St. Louis Milk Marketing Company

The Southern Illinois Milk Producers' Association will form a co-operative milk marketing company through which all milk will be sold direct to distributors and through other wholesale methods. The Illinois Agricultural Association having a membership of 11,000 in the nine dairy counties surrounding St. Louis offered to assist the producers in forming their marketing organization by supplying ten solicitors for thirty days to sell stock, by getting in experts of other co-operative marketing associations to help outline the organization, and by the use of their legal department.

The only requirements were that the Illinois Agricultural Association must know that the form of organization outlined is one which will be a forward step in solving the problem of milk producers. The Agricultural Association is a promotion and service organization composed of farmers of all lines in all parts of the state and will not take an active part in the company when organized.

Over half of the delegation in attendance at the meeting of milk producers were members of the local farm bureaus and I. A. A. The meeting unanimously accepted the services of the state association. The agricultural association has set aside a fund of $7,500 to assist in this work, and if necessary will contribute more. A meeting will be held in two weeks at which time leaders from Chicago and Minneapolis milk marketing companies and legal advisors will be present to assist in forming this organization. Milk producers have been on strike since Sept. 17 and have just come to a settlement with the dealers. —D. I. A. A. News Service.

NATIONAL JERSEY SHOW AND SALE

Week at Shreveport Great Success. Sixty Jerseys Average $707. Show Goes to Dallas in 1921

THE first National Jersey Show, held in connection with the Louisiana State Fair October 28 to November 7, more than met expectations. The exhibit was the best seen in the country this year, the facilities for displaying the animals were excellent, and the attendance of interested dairymen exceeded that of all previous shows of the year. The week's success may be guaged by the plans already under way for staging the second national show at Dallas in 1921 and offering twice the Shreveport premium total of $6,000.

In the second National Jersey Sale held with the show, sixty animals brought an average of $707. The quality of this selected offering was high and some prices were well below values. When the financial situation of southern agriculture is considered, however, the auction must be rated as highly satisfactory.

The Show

Two hundred head of Jerseys put across the proposition in the minds of those who took this show to Louisiana. The South is ready for better dairy cattle—so Jersey breeders changed the words of "Dixie" to "Now the Jersey's queen in Dixie" and put on an exhibition to liven up the interest in the breed. Undoubtedly much was accomplished. Besides a goodly ringside attendance, thousands of southern farmers were acquainted daily with the events of the show by very liberal newspaper publicity.

The exhibit was made up from seventeen herds in ten states. The premium list of $6,000 permitted offering eight prizes in each class, ranging from $45 down, in most classes, and from $100 down for exhibitor's herd, young herd, and calf herd. This constituted the largest money awards ever made in a Jersey show. Eight herds succeeded in winning second place ribbons but the blues all went to three with the purples evenly divided between two. Longview Farm of Missouri won thirteen firsts and four seconds and showed senior and grand champion bull and junior champion female; Ed. C. Lasater of Texas won six firsts and eight seconds; and Ayer & McKinney of New York won four firsts and four seconds and senior and grand champion cow and junior champion bull.

M. D. Munn of Minnesota, president of the American Jersey Cattle Club, officiated in the ring with Hugh G. Van Pelt of Iowa as associate judge.

The bull classes, particularly, were much better than at Chicago, from the aged sires to calves. Raleigh's Oxford Prince, Lasater's 1918 National Dairy Show grand champion, was an easy winner among the mature bulls. He shows his eight years a trifle but measures up in size, type, and Jersey masculinity. Chief Raleigh, Longview's three-year-old, found a close competitor in Dahlia's Noble Fern, owned by A. H. Henderson of Louisiana, but won the class. Fashionable Fern Lad, Longview's 1920 National Dairy Show grand champion two-year-old, took the blue in his class and later won highest honors by defeating the other aged winners and Ayer & McKinney's junior champion, Brampton Patricia's Prince. The grand champion won on his lines, his neatness, and his finish. He lacks the depth and spring of rib of the Lasater bull and of his three-year-old stablemate. The junior champion, the grand champion at Toronto this year, fought his hardest battle in the class where he met Wolff's Chieftain and, Longview's Dairy Cattle Congress and National junior champion. The New York calf is larger and perhaps a little stronger but was heavy over the top and lacked the finish and clean cut form of his contendor.

Lasater won in a class of 18 aged cows with Grove Bell Queen, second place going, after some debate, to Imp. Lady Gilbert, exhibited by Ayer & McKinney. The larger, stronger Texas cow suited the ringside better than the refined type of her New York rival. Both cows were a bit faulty in udder but either would have been a worthy winner. Two Longview four-year-olds led their class, Raleigh's Star of Peace and Fontaine's Nema, respectively. Longview's Rochette's Noble Nina was the best three-year-old, defeating Meridale Fern's Jess.

The feature of the entire show was Imp. Fern's Oxford Triumph, Ayer & McKinney's two-year-old, widely advertised as "the $15,000 cow". She was made grand champion, but not without two very close decisions. In her class, You'll Do's Fairy owned by the Thomasville Livestock Company of Georgia, was a strong contendor. The Georgia heifer is larger and has the substance which pleased onlookers. She was shown dry but gave evidence of a superior udder. The winner was showier and of the small finished type. Again in the senior championship competition, there was no clear decision for the winner—the aged cow and the three-year-old both excelling her in points. The latter had the best udder of the three. The aged cow lacked the flash of the two-year-old but was her equal in type and excelled in size, capacity, and strength of top. A reversed decision would have pleased many. The two-year-old had no difficulty in defeating Longview's junior champion, Raleigh's Blue Feather, a senior yearling.

The following gives the awards by classes for the first five places:

Bull 4 years old and over:—1, Ed. C. Lasater, Texas, on Raleigh's Oxford Prince; 2, Smith Farm, Louisiana on Campanile's Golden Fern; 3, C. E. Shuptrine, Alabama, on Peerless Jolly Fern; 4, Ayer & McKinney, New York, on Val Darkie's Ajax. Bull 3 years old and under 4:—1, Longview Farm, Missouri, on Chief Raleigh; 2, A. H. Henderson, Louisiana, on Dahlia's Noble Fern; 3, White City Jersey Farm, Oklahoma, on Tulsa Chief; 4, Lasater on Madam's Oxford Noble. Bull 2 years and under 3—1, Longview Farm on Fashionable Fern Lad; 2, Lasater on Ester's Falfurrias Oxford; 3, White City Jersey Farm on Eventide Bell Boy; 4, Thomasville Live Stock Co., Georgia, on Reception Stockwell; 5, Estate H. C. Minor, Louisiana, on Lucinda's Pansy's Fontaine. Bull 18 months and under 2 years—1, Lasater on Falfurrias Nobleman; 2, Island Home Farm, Tennessee, on Fern's Noble Dictator. Bull 1 year and under 18 months—1, Lasater on Tormentor's June Prince; 2, White City Jersey Farm on Distinction's Golden Lad; 3, Longview Farm on Manora's Fairy Lad; 4, Estate H. C. Minor on Oxford Financial Noble; 5, J. K. Dering, Illinois, on Oxford Chieftain. Bull calf 6 months and under 12 months—1, Ayer & McKinney on Brampton Patricia's Prince; 2, Longview Farm on Wolff's Chieftain 2nd; 3, Lasater on Golden Lily's Nobleman; 4, Longview Farm on Blue Feather's Raleigh; 5, A. H. Henderson on Viola's Campanile. Bull calves under 6 months—1, Longview Farm on Star's Fairy Lad; 2, Longview Farm on Buttercup Butter Lad; 3, Lasater on Great Scott's Nobleman II; 4, White City Jersey Farm on Isabelle's Champion; 5, Smith Farm on Lilac's Golden Fern.

Cow 5 years old or over—1, Lasater on Grove Bell Queen; 2, Ayer & McKinney on Imp. Lady Gilbert; 3, J. E. Jones, Missouri, on Financial Lad's Lovely Sweet; 4, A. H. Henderson on Fern's Oxford Ever; 5, Smith Farm on Jolly's Bayleaf of Falfurrias. Cow 4 years old and under 5—1, Longview Farm on Raleigh's Star of Peace; 2, Longview Farm on Fontaine's Nema; 3, Thomasville Live Stock Co. on Fern's Oxford Duchess; 4, Lasater on Village Knight's Jessie; 5, Lasater on Eminent Lad's Edith You'll Do. Cow 3 years and under 4—1, Longview Farm on Rochett's Noble Nina; 2, Ayer & McKinney on Meridale Fern's Jess; 3, Longview Farm on Raleigh's Lily White; 4, Lasater on Raleigh's Alice of Falfurrias; 5, C. F. Stevehaln, Connecticut, on Oxford You'll Do's Pet 2nd. Cow 2 years and under 3—1, Ayer & McKinney on Imp. Fern's Oxford Triumph; 2, Thomasville Live Stock Company on You'll Do's Fairy; 3, Henderson on Beauty's Victoria K. Mt. F.; 4, Longview Farm on Chieftain's Manora; 5, Island Home Farm, Tennessee, on Sultan's Foxy Cowslip. Heifer 18 months and under 2 years—1, Longview Farm on Raleigh's Blue Feather; 2, Ayer & McKinney on Brampton Annette; 3, Lasater on Great Scot's Constance; 4, Lasater on Fancy Falfurrias Carnation; 5, Longview Farm on Raleigh's Queen o' the Night. Heifer 1 year and under 18 months—1, Longview Farm on Raleigh's Royal Fairy; 2, Lasater on Great Scot's Lady Westgate; 3, Lasater on Knight's Favorite Fern; 4, Ayer & McKinney on Hauteville Virginia; 5, Henderson on Double Majesty's Julia. Heifer calf 6 months and under 12—1, Ayer & McKinney on Brampton Golden Wanted; 2, Longview Farm on Raleigh's Miriam; 3, Longview Farm on Raleigh's Pretty Maiden; 4, Lasater on Great Scott's Silver; 5, Henderson on Golden Fern's Dainty Miss. Heifer calf under 6 months—1, Lasater on You'll Do's Royal Sensation; 2, Ayer & McKinney on Meridale Cowslip; 3, Longview Farm on Raleigh's Royal Maid; 4, Dering on Raleigh's Bright Maid; 5, Lasater on Constance's Michaelmas Royal Sensation.

Senior and grand champion bull—Fashionable Fern Lad, owned by Longview Farm, Missouri. Junior champion bull—Brampton Patricia's Prince, owned by Ayer & McKinney, New York. Senior and grand champion cow—Imp. Fern's Triumph, owned by Ayer & McKinney. Junior champion cow—Raleigh's Blue Feather, owned by Longview Farm.

Cows having Register of Merit record of 600 lbs. fat at 5 years and over—1, Lasater on Majesty's Flo of F. Cows having Register of Merit record of 400 lbs. fat made under 5 years—1, Longview Farm on Raleigh's Star of Peace; 2, Lasater on Village Knight's Jessie; 3, Henderson on Fern's Oxford Ever; 4 and 5, Lasater on Eminent Lad's Edith You'll Do and Majesty's Flo of Falfurrias.

Exhibitor's herd—1 and 3, Longview Farm; 2, Lasater; 4, Henderson; 5, Thomasville Live Stock Company. Breeder's young herd—1 and 4, Longview Farm; 2 and 5, Ed. C. Lasater; 3, White City Jersey Farm. Calf herd—1, Longview Farm; 2, Lasater; 3, White City Jersey Farm; 4, Cedar Crest Farm; 5, Henderson. Get of sire—1 and 5, Longview Farm; 2, Henderson; 3, Lasater; 4, Shuptrine. Produce of 1 cow—1 and 4, Longview Farm; 2 and 3, Lasater; 5, Henderson. Dairy herd—1, Ayer & McKinney; 2, Lasater; 3, Longview Farm; 4, Henderson; 5, Shuptrine.

The Sale

Twenty-one consignors from thirteen states sold cattle in the Second National Jersey Sale to breeders in eleven states and Canada. Louisiana and Texas were the heaviest buyers, taking twenty and eighteen head respectively. S. A. Guy of Louisiana took the largest number, paying $4,600 for six head.

R. J. Fleming of Ontario bought the two highest priced animals of the sale. You'll Do's Fairy, the two-year-old second prize heifer consigned by the Thomasville Live Stock Company of Georgia, was the top cow, going for $4,000. This animal in the show the preceding day was a very close contendor for honors over the grand champion female. The leading bull in price was Buttercup's Butter Lad, a February, 1920, calf from Longview Farm. He sold for $3,200. He is by Flora's Queen's Raleigh and out of Raleigh's Eminent Buttercup whose production of 85.9 lbs. of milk in a day is a world's record. This calf is a strongly line bred Raleigh.

The opening bid of the sale was $1,000 offered for Fern's Oxford Duchess, a four-year-old daughter of Fern's Oxford Noble, consigned from the Georgia herd. She was struck off to W. P. B. Frelinghuysen of New Jersey for $2,350.

The center of interest of the auction was Gamboge's Vellum Majesty, M. D. Munn's seven-year-old herd sire. There was much speculation concerning the price he would bring. He was grand champion at the National Dairy Show in 1917 and has sired the greater part of Mr. Munn's present herd. Bidding was slow. Mr. Lasater's offer of $2,000 was finally raised by T. C. Barrett, Jr., of Louisiana who became owner of the champion for $2,100.

The only other animal of the sale to reach $1,500 was the senior calf, Raleigh's Miriam, grand champion of the 1920 Dairy Cattle Congress. She was consigned by Longview and purchased by C. M. Gouch of Tennessee.

The following lists the animals selling for $500 or more and gives their buyers:

S. A. Guy, Louisiana	
Aldan's Surprise	$800
Raleigh's Golden Brightness	850
Imported You'll Do's Pet 2nd	1,225
Fancy Falfurrias Carnation	1,025
R. J. Fleming, Ontario, Canada	
You'll Do's Fairy	$4,000
Buttercup's Butter Lad	3,200
T. C. Barrett, Jr., Louisiana	
Gamboge's Vellum Majesty	$2,100
B. R. Parrish, Kentucky	
Majesty's Morn Merline	$575
Ed. Lasater, Texas	
Majesty's Vellum Girl	$825
Fern's May Dolly	550
China Bell's Jolly Maid	750
A. H. Henderson, Louisiana	
Majesty's Elm Maid	$500
C. M. Gouch, Tennessee	
Raleigh's Miriam	$1,500
L. P. Townsend, Iowa	
Financial Fern Lady	$500
P. H. B. Frelinghuysen, New Jersey	
Daisy's Fern Maid	$1,050
Fern's Oxford Duchess	2,350
W. R. Spann, New Jersey	
Floss of Oaklands	$500
Knight's Favorite Fern	600
B. T. Sumner, Texas	
Eminent's Foxy Cactus	$500
Goddington's Cowslip	650
Mrs. C. Ellingsworth, Pennsylvania	
Minette's Sultana	$1,050
C. M. Hutton, Louisiana	
You'll Do's Gold Lock	$1,050
E. K. Smith, Louisiana	
Golden Lily's Nobleman	$700
Longview Farm, Missouri	
Financial Lad's Lovely Sweet	$1,400
Albert Seple, Louisiana	
Regina's Fern of Fitch Farm	$525
A. N. Hoopes, Pennsylvania	
Financial Plymouth Anna	$1,000
D. T. McCarty, Missouri	
Mary You'll Do	$700
W. H. Webb, Texas	
Hauteville Buttercup	$500

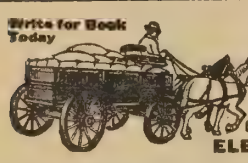
The Banquet

On Friday evening breeders crowded a banquet hall, in a Jersey get-together. Many instructive and entertaining remarks were heard from southern cattle men and from visitors from the North. The occasion furnished opportunity for expressions of appreciation from Dixie dairymen for the inspiration of a show made possible through the co-operation of northern breeders. It gave opportunity also for public acknowledgement of the many courtesies extended exhibitors in the show management. Special mention was given the work of C. H. Staples and W. R. Hirsch.

James Pierce Dead

James Pierce, editor and owner of the Pierce Farm Weeklies, died at his home in Des Moines on November 1st.

Mr. Pierce was born on a farm in Ohio on May 9, 1848, and, though nearly 73 years old, at the time of his death was in active charge of his various publications, The Iowa Homstead, The Wisconsin Farmer, and The Farmer and Stockman. While a boy he was employed as a printer's apprentice, but at the close of the Civil War he engaged in farming in Northern Missouri, and somewhat later established himself as a printer and publisher of various county papers.



Mr. Pierce has been a vigorous champion of farming and farmers. He was a good fighter and employed a trenchent pen. He will perhaps be best known for these qualities, but many of his editorials were filled with sentiment and kindness that endeared him to his great host of readers.

"13,965 Miles —and Still Going Strong"

Not phenomenal mileage, to be sure. But how many truck owners are getting even so much from their tires? By the time this tire is past its usefulness it will probably have given from twenty to thirty thousand miles. Even this is not unusual — for a Kelly Caterpillar.

First Bull Association Sale

"I'll show 'em a real bull next year."

The time was Oct. 22nd, 1920.

The place was the cattle shed of the Piedmont Fair Association at Greenwood, S. C.

The occasion was the Inter-association Bull Show—the first of its kind in the United States.

The remark quoted above came from one of the bull keepers as he led his charge back into the cattle shed and tied him in his stall. The bull had won second place in his class where eleven bulls had been entered. The bull keeper was dissatisfied with winning second place and the explanation is the story.

In the Piedmont section of South Carolina, the boll weevil appeared this year for the first time, and the damage done upset the calculations of some of the died-in-the-wool cotton growers.

To encourage diversification of agriculture and to increase interest in the bull association work with Jersey cattle, some of the Clemson College and U. S. Department of Agriculture Extension workers, being of a prudent nature and foreseeing, conceived the idea of staging an Inter-association bull show. Greenwood is the center of a progressive section of the Piedmont and in the counties adjacent to Greenwood there are at present seven Jersey bull associations. The Piedmont Fair officials were glad to encourage this new feature and agreed to finance the entire cost of bringing the bulls to the fair including the expenses of each bull keeper.

In the show held, the seven bull associations of McCormick, Greenwood, Laurens, Greenville, and Abbeville counties were represented by twenty-three Jersey bulls, carrying in their veins some of the best Jersey blood in America.

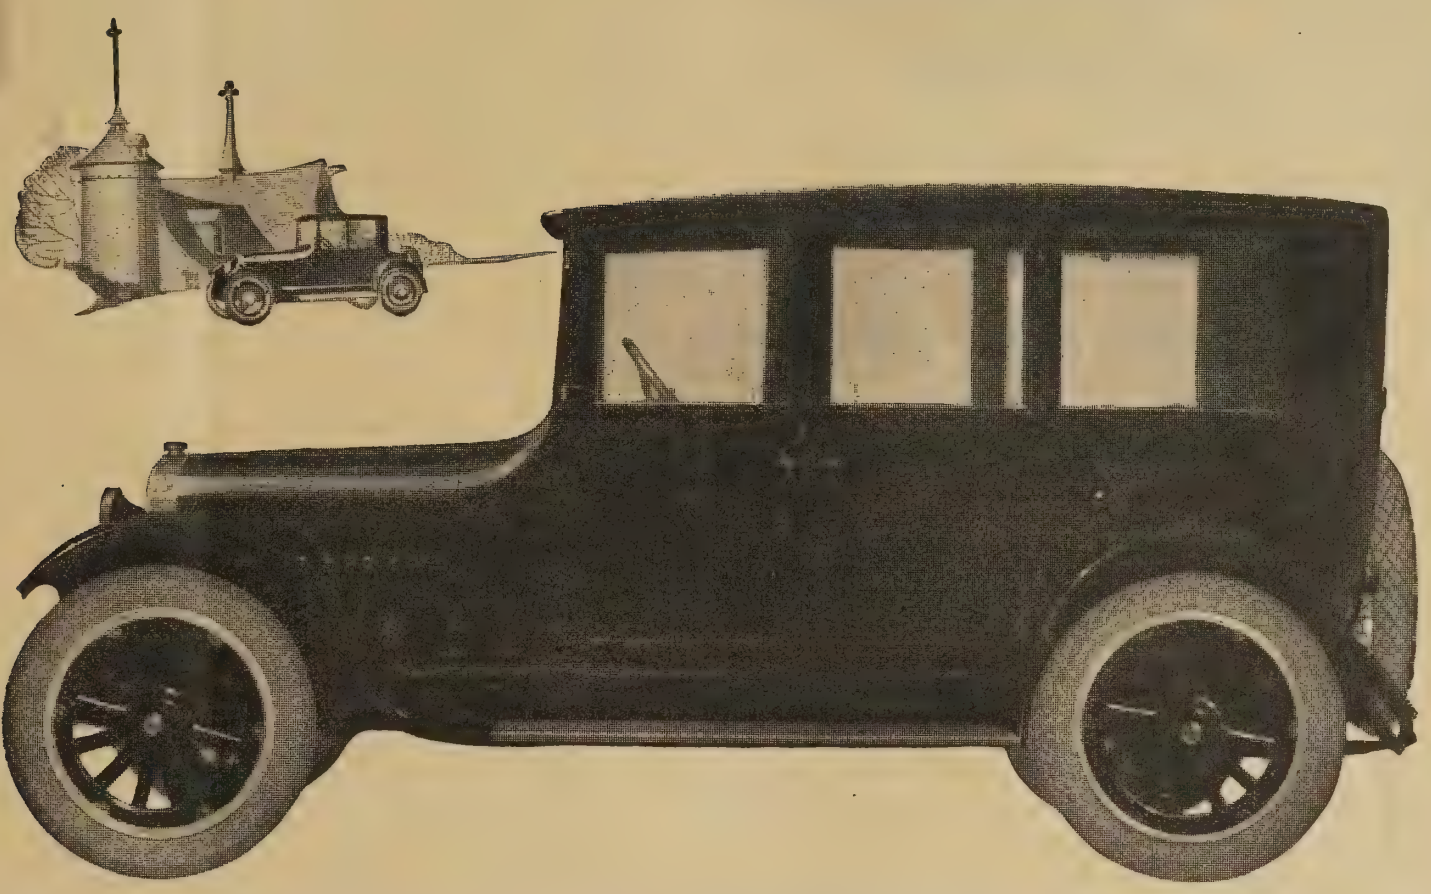
The classes and winners are as follows:

Three years old and over—1, McCormick Bull Association on Golden Jollys Killiarn; 2, Simpsonville Bull Association on Bonnie Jesup Lad; 3, Fountain Inn Bull Association on Blue Fox of Fountain Inn. Two years and under three:—1, 1st Abbeville Bull Association on Lieutenant Pogis; 2 and 3, 3rd Abbeville Bull Association on Lime Ridge Rosalyn's Torono and Lime Ridge Lass Tor. One year and under two—1 and 3, Greenwood Bull Association on Gamboge Prince of Nutwood and Bossie's Gamboge of Nutwood; 2, Simpsonville Bull Association on Captain's Financial Victor. Best kept and handled bull, any age—1, Simpsonville Bull Association on Bonnie Jesup Lad; 2, 1st Abbeville Bull Association on Lieut. Pogis; 3, Fountain Inn Bull Association on Blue Fox of Fountain Inn. Best Jersey bull association exhibit—1, Greenwood Jersey Bull Association; 2, First Abbeville Jersey Bull Association; 3, Laurens Jersey Bull Association; 4, Second Abbeville Jersey Bull Association; 5, McCormick Jersey Bull Association. Grand champion Jersey bull—McCormick Bull Association on Golden Jolly's Killiarn.

The value of the show cannot be estimated because there are so many angles to be considered. Without a doubt, a new pride has been developed among the five hundred or more South Carolina farmers who have money invested in the bulls shown. Farmers from all over the Piedmont were present to inspect the bulls and to witness the judging.

The show was also a great demonstration in the proper care and handling of bulls and the proper fitting of them for the show ring. Many of the bull associations organized in the United States have gone on the rocks because the proper man could not be secured as bull keeper. That has always been the real problem in the organizing of bull associations. As these animals came to the fair, they were not trimmed and clipped and polished after the manner of regular show animals; but before a single animal went into the show ring, they were all put in excellent show condition by the bull keepers under the direction of the dairy specialists and county agents present.

The judging was done by Professor W. W. Fitzpatrick of Clemson College and every decision was carefully explained to a large and highly interested audience. This was one of the educational features of the show. Many farmers who saw the show had never been to college or paid any attention to the fine points of cattle. Professor Fitzpatrick explained the placing of each bull and answered questions from those present. The excellent material afforded a real opportunity to give a demonstration in the proper judging of cattle.



Under the direction of the Greenwood Jersey Bull Association, a sale of 26 Jersey cows and heifers was held on the fair grounds. Mr. D. D. Elliott of Wisacky was manager of the sale. The offerings were excellent and farmers wanted cattle but the low price of cotton acted as a damper. However, the cattle with a few exceptions went to the five counties mentioned above. With bulls of breeding shown above and cows of successful and popular blood lines, the future of the Jerseys in the Piedmont is assured.

The show was an experiment but the results are already manifest in the new interest and enthusiasm among Piedmont farmers. It passed the acid test when the fair officials, who had financed the show and arranged for the prizes, expressed themselves as having received their money's worth. The farmers have a new and intelligent interest in Jersey cattle. The stockholders of the bull associations have seen their bulls bring home the prize money. The bull keepers are alive with the lure of the show ring. They have a new pride and a new interest in their charges and are working hard for the show next year, and for the year after when the bulls and their get will probably be shown under the auspices of the Piedmont Jersey Cattle Club which will shortly be organized.

So. Carolina. HENRY JOHNSON.

Uncle Ab says: When you feel that you've got to say just what you think, it's sometimes best to stop—and just think.

OAKLAND OWNERS REPORT RETURNS OF FROM
18 TO 25 MILES PER GALLON OF GASOLINE
AND FROM 8,000 TO 12,000 MILES ON TIRES

THIS NEW OAKLAND SENSIBLE SIX FOUR DOOR SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

LET your new car be an Oakland Sensible Six Sedan. For the farmer, as for every other class of citizen, this is the thoroughly practical automobile. It is the most useful car, providing homelike comfort and security in any weather. It is the most sensible car, linking its many advantages to the minimum of operating cost. The present Oakland Sensible Six Sedan retains the proved high-power and light-weight principle of construction in an even stronger chassis of longer wheelbase. However you judge it, whether by performance, reliability or economy, it affords a value not to be duplicated in any other type of automobile.

OPEN CAR, $1395; ROADSTER, $1395; FOUR DOOR SEDAN, $2065; COUPE, $2065

Clipping a Jersey from Natoma Farm, near Hinsdale, Ill.

Five Minutes a Month

with the Stewart Clipping Machine on a dairy cow keeps the hair short on udder, flanks and underline, making cleaning before milking a quick, easy job. Long hair gathers dirt and filth, that can't be prevented from dropping into the milk. Regular clipping is a big help toward keeping the cow clean. Only a clean cow produces clean milk. Clip with a Stewart —no progressive dairy farm can afford to be without it. Let Stewart users tell you their experience:

Stewart No. 1 Cow Clipping Machine

For Certified Milk

EDGEMOOR FARM
Santee, Calif., Feb. 9, 1920.
We find that keeping the tail, udder and hindquarters of all of our cows in milk clipped helps greatly in keeping down the bacteria count, which is absolutely necessary in certified milk.
Edgemoor Farm.

Low Bacterial Count

HADDON FARMS
Haddonfield, N. J., Nov. 20, 1919.
We clip the udders and flanks of our cows, and have the lowest bacterial count of any milk going to Philadelphia and Atlantic City.
E. F. Gill.

Equal With Barn Cleaning

Rockton, Ill.,
Dec. 2, 1919.
I have used a Stewart Clipping Machine for several years. Believe that anyone trying to produce clean milk will find that clipping is as necessary as barn cleaning.
F. E. Zahm.

Cows Give More Milk

HILLSIDE DAIRY FARMS
Westby, Wis., Apr. 3, 1920.
The clipper is doing excellent work, and cows gain from four to ten pounds of milk a day. It makes milking a nice clean job.
Thos. Sebion.

Clip your cows with the Stewart No. 1 every thirty days during the stabling season. Complete, ready for a lifetime of service, only $14 at your dealer's, or send $2 and pay balance on arrival.

Electric Clipping Machine, 110 Volts, A. C., $80

Washington, D. C., Weekly News

[Special to Hoard's Dairyman]

Washington, Nov. 10—Reports received at the headquarters of the Maryland-Virginia Milk Producers' Federation indicate that this organization is growing and increasing in efficiency every day. The reaction from the election of officers which took place three weeks ago is a very satisfactory one, and has been followed by numerous voluntary applications for membership, and a number of instances where members have gone out and signed up their neighbors. The association voted at its annual meeting to apply for affiliation with the National Milk Producers' Association. The full list of officers elected includes Dallas Berry, president; J. G. Thompson, vice-president; T. E. McLaughlin, secretary and general manager; and Y. E. Booker, Jr., treasurer. Two field agents were named, C. T. Rice of Oakton, Va., and H. H. Fraley of Derwood, Md. President Berry has been a member of the old executive committee since 1916 and was chosen president without opposition. He succeeds Daniel A. Slaughter, whose death but a short time before the annual meeting was a great loss, and a severe blow to the organization. J. G. Thompson, the new vice-president, was also for some years a member of the old executive committee. Thirty directors were elected, ten to serve one year, ten for two years, and ten for three years. The executive committee consists of the president and vice-president, and Messrs. Frank S. Walker, J. Clifford Miller, and Maurice Stabler.

An attack on the insufficiency of the tuberculin test as a means of preventing tuberculosis infection in the milk supply in this city appears in the Washington papers this week, signed by President Berliner of the Anti-Tuberculosis society. He calls attention to the possibility of "doping" to prevent a real test, and of the intervals between tests when infected animals are likely to get into milk production herds, and thus infect all the milk. He urges pasteurization of all milk used. In answer to this representatives of the milk producers call attention to the vital statistics of the District of Columbia, proving a decrease in number of tuberculosis cases, and a material decrease in deaths from tuberculosis and in infant mortality in the past three years, which Health Officer Fowler broadly intimates is traceable in large part to the excellent milk inspection regulations, including the requirement that all cows whose milk is permitted to be sold here shall be tuberculin tested.

Dr. C. W. Larson of the Dairy Division in discussing this called attention to another aspect of the case which is often lost sight of. Eradication of tuberculosis, he said, is doubly important, first as a health measure, for no none wants to use milk from unhealthy cows, no matter what the trouble, and second as an economic matter. "I was in Massachusetts recently," he said, "talking with one of the biggest milk producers there. He does not raise his own cows but buys them. He told me that he could not get profitable results from a cow which had tuberculosis. They were unprofitable animals. We too often lose sight of this end of the tuberculosis question. Cows diseased ought to be removed from the herds because they do not and can not produce milk as cheaply and as efficiently as healthy cows."

R. R. Graves of the Dairy Division made an address at Montgomery County (Md.) Pomona Grange, last week, describing the work in pure-bred animal investigations being carried on at the Beltsville Experiment Station. He explained the plans of the Dairy Division to make an effort covering several years to fix prepotent characteristics of certain great producing strains, if this can be done, and if possible to discover how it can be done. To carry this out, experiments in line breeding, and in cross breeding are to be carried out, and large numbers of both male and female progeny tested carefully. The number of bulls is already exceeding the capacity of the station, and numbers are being loaned to experiment stations, to carry on the testing and tabulation of results. He said that the supply was larger even than the experiment stations could use and offered to loan bulls to dairymen in the territory near Beltsville upon agreements to continue the testing and keeping of records.

Hopkins Resigns

HOARD'S DAIRYMAN:—"The producer of both meat and milk producing animals is confronted with serious marketing difficulties which must be satisfactorily handled if these industries, the state, and the nation are to prosper."

This was the key-note struck by A. W. Hopkins in his letter of resignation of the secretaryship of the Wisconsin Live Stock Breeders' Association—that the association was in a position of opportunity to render a distinct service to Wisconsin stockmen by setting itself seriously to the task of helping to answer this and other large questions.

The Wisconsin Live Stock Breeders' Association was organized in 1901 by leading Wisconsin stockmen. Since that time it has had seven secretaries, although Mr. Hopkins, who has just retired, was actively associated with the work almost from the very beginning. The other secretaries are: Frank W. Harding of Waukesha, W. L. Carlyle of Madison, L. F. Martiny of Chippewa Falls, F. H. Scribner of Rosendale, Eben E. Jones of Rockland, R. W. Rowlands of Waukesha, and A. W. Hopkins of Madison.

In 1911 the association received an appropriation of $4,000, which was soon increased to $7,000. At the present time it is granted $9,000 a year.

The appointment of George W. Davies, the assistant secretary, is significant of another phase of the work now being carried on. It has been generally admitted that the organization of the farmers has been pretty completely performed, and that the education campaigns, such as the pure-bred sire drive, has mainly accomplished its purpose. For Wisconsin to continue her progress, or even to exceed what has already been accomplished, the younger generations must be aroused. For this reason boys' and girls' club work is being emphasized at the present time almost to the exclusion of the other work. Mr. Davies is a trained teacher and educator, and thoroughly familiar with the boys' and girls' club work program.

The Wisconsin Live Stock Breeders' Association is not the work of one man, or the result of one idea. Back of it has been the co-operation of the leading stockmen of Wisconsin but co-ordinating their efforts, inspiring their imagination, and tireless his activities has been Mr. Hopkins. In his brief letter of resignation he scarcely touches upon the personal side of his work, but those who have been more or less closely associated with him can testify to the interest he took in Wisconsin live stock affairs.

Wisconsin. W. A. FREEHOFF.

Cessation of work with crops should give time to fix up around the farm.

More Milk Right Down the Line

CHAS. P. WERRY has had some interesting and typical experiences in getting more milk with Purina Cow Chow. Read what he says:

"I have used Purina Cow Chow for four or five years. Last year I contracted for 30 tons and a car of gluten, and fed in the proportion of two bags of Cow Chow to one of gluten. I got out of gluten in February and after that fed Cow Chow alone. *The cows did better on your feed alone* than with the gluten mixed in. This was my experience on my home farm."

"On my other farm I *got out of Cow Chow* and could get no more from the dealer and the cows *went down a can of milk*. This year I have contracted for 60 tons and will feed it entirely alone, having bought no gluten at all."

"I have been entirely free from bag trouble which I cannot say as to other feeds I have used. The cows not only *milked better than with my own mixtures* and other feeds but they *remained in good condition* during the season."

Chas. P. Werry, Westtown, N. Y.

Such experiences don't just "happen so." There are reasons back of them that you should know. Let us send you some interesting facts about Purina Cow Chow. Order Cow Chow from your nearest Purina dealer.

"BALL BAND" TRADE Red Ball MARK

What the Red Ball Stands For

Satisfying fit.

Real comfort for your feet.

More Days Wear, at the lowest cost per day's wear.

These are the things the Red Ball Trade Mark stands for—these are the reasons why ten million people wear "Ball-Band" Rubber Footwear.

Look for this Red Ball when you buy Rubber Boots, Arctics, or Light-Weight Rubbers.

Ask your dealer for our free illustrated booklet, "More Days Wear." It will show you many of the different styles of Rubber and Woolen Footwear which we manufacture.

MISHAWAKA WOOLEN MANUFACTURING COMPANY
313 Water Street Mishawaka, Ind.
"The House That Pays Millions for Quality"

Dairying Thirty Years Ago

Taken From the Issue of Hoard's Dairyman of Nov. 14, 1890.

There ought to be added to the curriculum of our Universities and Colleges a special department for teaching the "Science of Common Things", familiarly known as "gumption".

Edward Atkinson, the great statistician, is reported as having said that the greatest invention of which he can conceive would be to perfect a scheme that would transfer atmospheric nitrogen into available plant food.

The United States of Columbia, S. A., imported during the last fiscal year, from the United States, 60,710 pounds of oleomargarine and other butter importations at about 12 cents per pound. In the same time was imported from the United States 279,943 pounds of butter valued at $51,151, or 19 cents per pound. The amount of cheese exported to that country was 228,229 pounds valued at $29,593, or 13 cents per pound. Venezuela took over twice the amount of butter at the average price of 17 cents per pound and but one-twelfth the amount of butter imitations. Fraud butter sold on its merits does not find favor with the South American states.

An Enlightened Agriculture

In Volume One of the Conquest of Mexico, the historian, Prescott, devotes several pages to a description of the agriculture of the Aztecs and makes use of the following words:

"The same enlightened spirit applied to agriculture raises it from a mere mechanical drudgery or the barren formula of traditional precepts to the dignity of a science."

The foregoing sentence contains the whole philosophy of agricultural progress. Every farmer can apply it as a tape line for his measurement. Is he applying an "enlightened spirit" to his farming operations? Is he following the "barren formula of traditional precepts" in his judgment and work on the farm? Is he trying to be a man of science, or an automaton?

He does not need a college education to "apply enlightened spirit" or become a scientific farmer. All he needs is to exercise brains enough to have a reason for what he does, and how to do it. That is all.

Mothers, Use Milk

"Can you have all the milk you want to drink?" asked one boy of another. "Why, of course, can't you? My mother tells me to drink all I want. She thinks it's good for me." "I wish my mother would say that," replied the first speaker. "She will never let me have but the least little bit. She says she can't afford it." This conversation is of interest because it shows the mistaken ideas of economy which some women have. In the village where these two boys lived, milk was 5 cents a quart. Their mothers had nearly the same amount of money yearly to spend on food; one bought three or four quarts of milk every day and encouraged the children to drink all they wished; the other never bought more than a quart, yet, while she scrimped her family in regard to milk, she supplied pies, cakes, and other less wholesome food lavishly. It is a fact that few housekeepers are as generous with milk as with other food.

Even in farmers' families it is not unusual to find milk used sparingly on the table, while cream never appears except in honor of company. Such housekeepers evidently do not understand the value of pure milk as food. It is now extensively given in illness, many patients being kept alive by its use, as they can digest it when unable to retain anything else. Nearly all children like milk and there is nothing better for them. In a family where milk is constantly and freely used by the children, their supper always consisting of bread and milk, irregularities of digestion are almost unknown. Of course it is of utmost importance that the milk be pure. When it is impossible to satisfy one's self on this point, it is a wise precaution to heat the milk to a boiling point before using. There are also methods of sterilizing milk which render it harmless even when it contains poisonous germs. A true student of economy will deprive her children of pastry and doughnuts, but not of this wholesome food.—Orchard and Garden.

Twenty-second Lake Mills Sale

Lake Mills, Wis., Holstein breeders held their twenty-second semi-annual consignment sale at the Lake Mills sale pavilion October 27, when they sold 75 animals for $15,905, a fair price considering the inclement weather, present unfavorable market conditions, and the fact that no very high record animals were offered.

C. M. Beveridge topped the sale with Aaggie Segis Denver, a springing 2-year-old daughter of a 36-lb. sire and a 31-lb. dam. She was purchased by Andrew Frank of Wisconsin for $700.

Mack, Kelly, and Krause did the selling with Sale Manager F. H. Everson in the box.

Following is a list of all animals selling for $300 or more and buyers of same:

Milford Meadows Stock Farm, Wisconsin	
Primrose Jessie Johanna Inka 2d	$310
S. E. Jones, Wisconsin	
Mutual Fobes of Junction View	$400
Johanna Bessie Homestead Twisk	305
J. A. Craig, Wisconsin	
Mutual Pride Bessie Homestead	$505
Pearl Korndyke Wayne	500
Aaggie Baker Pell De Kol	350
Fred Gurr, Wisconsin	
Eagle Pontiac	$420
John Piper, Wisconsin	
Catalog No. 25½	$355
Geo. Hetts, Wisconsin	
Leon Johanna Piebe	$400
Halsey Sedgwick, Wisconsin	
Pansy Nell Senator Pontiac	$310
A. J. McFarlane, Wisconsin	
Sedgeland Hengerveld Inka Polkadot	$430
Sedgeland Mercedes Homestead	310
Ben F. Berg, Wisconsin	
Sedgeland Hengerveld Mercedes	$655
Roy Bues, Wisconsin	
Pearl Johanna Pontiac 2d	$500
Andrew Frank, Wisconsin	
Aaggie Segis Denver	$700
Daisy Homestead Inka	440
Marion Vale De Kol	325
Owen Mullen, Wisconsin	
King Veeman Oak De Kol	$300
Kilpatrick Bros., Wisconsin	
Princess Lily	$300
H. H. Bridge, Wisconsin	
Matina Colantha Maid	$325

There are only fourteen counties in the state of Illinois which do not have farm bureaus. At a meeting of the Extension Department of the University and the I. A. A. organization department, it was decided that both paries will assist any of these counties which show any amount of interest in organization. It was thought best not to invade these counties and establish farm bureaus without considerable interest shown by the home folks.

AN INDUSTRY IS NO STRONGER THAN ITS SERVICE TO THE PEOPLE

YOU have heard men say that good lumber is scarce. They say that lumber isn't what it used to be, and that we must soon come to use substitute materials.

Do you know how much good lumber there is in this country today? With the possible exception of the hardwoods there is as much good lumber available for construction purposes as there ever was at any time since America became a nation.

There is more standing timber today in the United States than ever was made into lumber since the Pilgrims landed on Plymouth Rock.

An industry is no stronger than its service to the people.

As substantial factors in the lumber business the Weyerhaeuser people wish to render real service to you and to everyone who uses lumber.

Whether you are a home-builder planning a beautiful residence; a workman who wants a couple of boards or a bunch of lath; a farmer building a cow-barn or a corn-crib; or a great industrial corporation specifying 10,000,000 feet in one order—we want you to know the facts about lumber.

To this end we will supply to lumber dealers and to the public any desired information as to the qualities of different species and the best wood for a given purpose.

This service will be as broad and impartial as we know how to make it. We are not partisans of any particular species of wood. We advise the best lumber for the purpose, whether it is a kind we handle or not.

What we advocate is conservation and economy through the use of the right wood in its proper place.

If we could insure your getting the wood you ought to have, it might mean a difference of years in the life and service of the lumber—fifty years perhaps as against a few months. So important is the selection of the right wood or grade of wood for a given use.

From now on the Weyerhaeuser Forest Products trade-mark will be plainly stamped on their product. You can see it for yourself at the lumber yard or on the job after it is delivered.

When you buy lumber for any purpose, no matter how much or how little, you can look at the mark and know that you are getting a standard article of known merit.

WAUPACA COUNTY

HOLSTEIN SALE

More Federal Accredited Herds than any other County in Wisconsin

Fair Grounds, Weyauwega, Wis.

Wednesday, Nov. 24th

(The Day Before Thanksgiving)

50 Choice Pure-breds

42 Females — 8 Bulls

Creditable Records
Superb Quality
Excellent Type

It will pay you well to consider the following: ¶ For instance there are 27 cows and heifers many with A. R. O. records, bred to 26-, 27-, and 29-lb. sons of Sir Pietertje Ormsby Mercedes 37th, the $100,000 bull recently sold from this county. Also some bred to 32-lb. and 41-lb. sires. A large proportion of these cows are due to freshen soon. ¶ There are six nice, large typy cows that will be fresh at sale time. They are real producers as indicated by their records. ¶ There are three dandy young heifers from good cows and sired by valuable bulls. Also there are three mighty good yearling heifers that will look good in your herd. One is a granddaughter of 37th. ¶ If you need a good bull be with us on the 24th and buy a grandson of 37th or one of the other good ones. Practically all are ready for service. Among them you will find a fine, light colored 24-lb. maternal brother to Ponderosa Grace Pietertje Ormsby, Wisconsin State Champion Junior 4-year-old with a record of 35.02 in 7 days. He is sired by a 29-lb. son of 37th. Some bull. ¶ Remember that 14 of the cows are bred to choice high record sons of Sir Pietertje Ormsby Mercedes 37th. ¶ **All animals over 6 months or age sold with the 60 - 90 day retest privilege.**

This sale is the day following the Waukesha and Watertown Sales — *complete the circuit*

Wisconsin
Ayrshire Breeders' Auction

(First Semi-Annual Sales Event)

Sale held at the
Madison, Wis., Live Stock Sales Pavilion
Tuesday, November 30th, 1920

***50 HEAD*— A Carefully Chosen Offering of High Class Ayrshire Breeding Cattle from Wisconsin's Foremost Herds — Cows in Calf, Bred Heifers, Open Heifers, 1920 Heifers, and a Few Bulls.**

Note the following consignors:

Aldebaran Farms, Stephen Bull, Prop., Racine, Wisconsin, include four head of choice young heifers of the right kind of breeding that should prove attractive to buyers.

Edelweiss Farms, Fred Tschudy & Sons, Monroe, Wisconsin, include a few choice young heifers of popular breeding and choice individuality.

J. W. McNab, Black River Falls, Wisconsin, contributes nine head of choice young cows and heifers, all popular in color, extra well bred individuals.

Adam Seitz, Prop., Spring City Herd, Waukesha, Wisconsin, contributes some extra choice quality females that will be an attraction in any herd they go into. Seitz cattle need no introduction. They have spoken for themselves for years. See them at the sale.

A. J. McNab, Black River Falls, Wisconsin, includes five head of good young females due to freshen this winter and spring. He breeds the big boned, good colored sort of popular blood lines.

Mrs. Sever Stavedahl, Brodhead, Wisconsin, includes two choice 1920 heifers and four head of splendid two-year-olds. These heifers are sired by the noted Wisconsin Dairy King, a grandson of Bargenoch Gay Cavalier Imp.

L. C. Streator, Ladysmith, Wisconsin, recently came into possession of the well-known Ferndell herd of Ayrshires. He is contributing twenty females and a few good young bulls, all of which have been inspected by the sale manager and pronounced O. K. in color, blood lines and individuality.

This offering is strictly composed of good, sound, clean cattle sold subject to the severest test and guaranteed to please or no sale.

Wisconsin breeders have repeatedly asked the sale manager to start Ayrshire auctions rolling in this state. A large number of breeders have promised their support.

The sale will be held in the Department of Animal Husbandry's Live Stock Sales Pavilion on the University Farm at Madison, Wisconsin. Remember the date — Tuesday, November 30th.

CATALOGS NOW READY

Write direct to the sale manager at once. Use a post card. Send your own and the names of other Ayrshire breeders you know. Plenty of catalogs for everyone.

Remember this is the first semi-annual Wisconsin Ayrshire consignment sale. Attend the sale, pick out what you want, get acquainted with the breeders and plan to enter some of your own cattle in the spring sale which will be talked over and decided upon at this event.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Broadening Out

Upon Their Arrival in Thomasville, Ga., Jimmy Writes to the Home Folks

THOMASVILLE, GA.,
AUGUST 29TH, 1920.

DEAR FOLKS AT HOME:—Well, here is your Jimmy, miles and miles away from you all, in the land of cotton, niggers, and mules and, as far as I am able to determine, in the land where people are just beginning to wake to better farming. We have been here nearly a week now, and of course I should have written you before this, but if I had I wouldn't be able to tell you one-half of what I can now. We have been travelling some since getting here, seeing the country and going to places of interest and, believe me, folks, when I say your little red-headed Jimmy will be quite content to stay in Wisconsin, for awhile at least, if he ever gets there again. It never used to mean much to me when as kids in the district school we sang Home Sweet Home. But say, "Be it ever so humble, there's no place like home," 'sgot some meaning to it now. That makes me think, Jerry, and I'm laughing right now about it, too, how we used to, and all the rest of the kids, also, say "womble" for humble when we sang that line. Poor little idiots,

A LITTER OF HAMPSHIRES ON THE RODENBERRY FARMS

we didn't know any better then, but I guess "womble" meant just as much then to us for all we cared, eh, Jerry? But, by jinks, humble's the word for me tonight as I sit here writing this letter.

Now I'm going to keep the experiences about the trip down here until I get home; so this letter will only contain news about our stay in Thomasville, and I guess by the time you get through reading this much you'll be glad to wait to hear the rest. Bob's out tonight. He thinks he's in pretty strong with a little southern dame that we both met at a party we got invited to the other evening. Guess she's interesting enough, but I get awful tired of listening to her drawling talk. And she's so languid, too. (My college dictionary's up in our room, Jerry, in the left hand corner of the second drawer in the dresser. I'll try not to use words that I think you do not all understand, but probably one will creep in once in awhile. So, if any words sound kind of big to you, just get the dictionary. But as I said, I'll try to write so that you will understand everything.)

There was a woman at that party who seemed to take quite a liking to yours truly, but of course as is always my luck with the women, she was married. Anyway, I could see that she was quite interested in me, and before the evening was over she made it a point to corner me, and the first thing she said was this: "You're from the North; I knew it as soon as I met you and heard you talk!" Then she whispered, kind of confidential like you know, "Oh, it does seem so good to hear some one talk who sounds his r's and speaks with some snap. I get so tired of listening to the way these people speak." Of course I guessed she must have come from the North, too, and so I asked her and I found out that she came from Buffalo, N. Y. She spent as much of the evening as she dared to with me (jealous hubby was there, too) and I felt kind of uncomfortable at times because you know these southerners are hot headed. Guess if I had wanted to do my part, there might be a divorce scandal in the southern courts! But thanks to you, dad, and the old willow tree that furnished the backing for you, I know my place when I'm out in society. She was mighty nice, though, and I felt just a bit sorry for her, because I really believe she is lonesome for the North. If she feels like I do tonight, I wouldn't blame her if she packed up and left on the next train.

But, Bob, he's different than I am. He seems to fit in better and he acts perfectly at ease no matter where he is. Must be his home training and his good looks that make him get away so strong. Well, as I said in the beginning, we are stopping in Thomasville. This is a pretty progressive little town of about 8,000 people. It is the county seat of Thomas County, one of the best agricultural counties in the state, according to the people here, and, of course, you'll have to take their word for it. This used to be a great winter resort for the northerners who have enough money to come south for at least a part of the winter. The spacious hotel accommodations are still here, but they have been turned into business blocks and offices. Northern people do not stop here so much now, but go right on through into Florida, where I presume there are greater attractions for this class of people.

We were surprised to find a Wisconsin man, secretary of the chamber of commerce here. And he attended the University of Wisconsin, too. He has made it interesting for us and has taken quite a bit of his time to show us around the country. The one thing that Thomasville boasts about at the present time is a big cow which they all talk about. When I first heard of it, I thought they probably had some kind of a monstrosity. But I soon learned that they meant just a plain, ordinary bull which is owned here by one of the best farmers. Well, he is not so ordinary, either, because he was the winner of the grand championship at the last International Stock Show. His owner is Mr. E. E. Mack of this place. He took us out to see his herd of Herefords one day, and incidentally we saw Bonnie J., the championship bull. Although I am not so interested in beef cattle, I'll have to admit that Bonnie J. is a wonderful animal. So this is what the people mean when they talk about the big cow; too modest to say bull, I guess. Mack's herd of fine Herefords goes to prove that the South can raise cattle successfully. This man Mack is an interesting fellow. We learned a great deal from him about conditions here in general. He has his buildings painted and things fixed up in good shape, and that is a lot more than can be said for the most of them here. He has a silo, too, and he showed us a field of sorghum that was yielding 20 tons of ensilage per acre. His corn was the best I have seen down here, too. When I told him that he said: "That's what manure will do for this soil!"

Mack seems to have solved the pasture problem for this section pretty well. You know that they can't have quite the same pasture crops down here that we have. They don't have our clovers, alfalfa, timothy, and blue grass to work with. Just imagine dad trying to get along without these. You'd say, "It can't be done". Yes it can, and Mack is doing it with great success. He makes a mixture of lespedeza, carpet grass, and Dallas grass. We saw a herd of about twenty Herefords pasturing on, well, I would say anywhere from thirteen to fifteen acres of this kind of pasture. Mack told us that they had been there without any other kind of feed since the latter part of February. It is August now and the pasture is in good condition and the cattle are sleek and fat. Some of them use Bermuda grass but Mack says that this mixture gives him better results. And you should see his lespedeza pasture in the pecan orchard. Just like a carpet, it's so thick and smooth. Speaking of pecans, this is a great pecan section. There are acres and acres of pecan orchards here, and I judge that some of the farmers are making this their main business.

Mack had a lot of calves and yearlings that he is fitting for the International again this year, so I suppose when that is over the natives will have something else to talk about. He has a hog farm, also, which he is just starting. We visited that, too. He had about a dozen breeding sows, Poland Chinas, that he had shipped in from Ohio. It did seem good to see a real hog again after seeing the razorbacks that run wild around here. This place was not as interesting as the other because it is just being started. By the way, Mack is a Wisconsin man. He was born up around Waupaca and he moved down here when a boy. He must have made good because he seems to be interested in the leading banks of the city. He's doing a big thing for the South in the way of better farming and I guess he's opening their eyes some to what can be done down here. They have one big advantage here and that is the weather. You don't have to have buildings that cost a fortune to start with. Mack says that if you work it right there is only a period of about sixty days that you have to feed in the barn. All the rest of the time the cattle can be pastured. And that makes me say right

'TWAS PAT THIS AND PAT THAT

here that the weather is quite delightful. It gets a little hot in the daytime, about noon, but the evenings are nice and cool. It's a lot different than I thought it would be.

Suppose you will be thinking that Mack is the only pebble down here. Well, that's not so for there are quite a few others who seem to be getting away pretty strong. For example, there is the Holman Dairy Farm. This is really a more modernly equipped place than Mack's. Of course, it has to be for he is in the dairy business and that makes some difference. We spent nearly half a day with Mr. Holman. He has a very fine herd of registered Jerseys. They surely were pretty. I asked him why there were not many of the big black and whites down here, and he answered with a twinkle in his eye: "They'd starve down here, boy, it takes too much to fill them up." Holman's a real fellow. We liked him so much that we found it hard to get away. His was the first farm that really made me think of our northern farms. His pastures were fine, too, but he was using quite a little of Bermuda in his.

The Neal Dairy Farm was also interesting in many respects. Mr. Neal has his buildings located right in a pine grove. The only objection I had to that was that it seems too shady for a dairy. He was filling his silo the day we were there, and it was funny enough to watch those niggers working. To begin with, they don't haul the corn from the field the way we do. They just pile all they can get in a three-deep wagon box, call it a load, and start for the silo. I asked Mr. Neal why they didn't really haul loads, and he said: "You can't get a

WE LEFT THEM CUSSING EACH OTHER

nigger to do that." Then he said, as if to turn the subject: "If you want to see something funny, climb up the ladder and take a peep into that silo; it's only about half full." I went first and Bob followed. What do you suppose, Jerry, I saw that was so funny? And it was funny, I assure you all. Eight nigger women lined up 'round the sides of the silo, dancing up and down to the tune of a song they were humming. Think of it, eight people in a silo to pack it. We are lucky if we can get two. Mr. Neal says that it takes that many, because a nigger will do just so much and no more. I'll tell you, dad, this section needs more white men engaged in farming before it will develop very fast. Niggers are too ignorant and irresponsible and too satisfied with what is.

I haven't mentioned Pat Ward yet, have I? Well, I mustn't forget Pat because I want you all to get acquainted with him. Pat is the county agent of Thomas County, and to me he was the most interesting man we met. He is well versed about southern conditions in general and especially about Thomas County, and he doesn't hesitate to tell you what he thinks. I am enclosing a picture of him which Bob took one day when we were out with him. That will give you some idea how he looks but it won't tell you the interesting side of him. Everyone knows him, and it's Pat this and Pat that. You'd think that he was expected to be all there is to know about agriculture, and he is just about that, too, as far as these people are concerned. They keep him busy and I guess they are getting their money's worth out of Pat. He's one of those kind that just takes things as they come, and does what he can with the job that's liable to turn up.

I didn't ask him, but I should judge that he stands a little better than six feet in his stocking feet. He doesn't stand exactly what the military department would call straight, but throws his head forward as if he didn't care when the rest of his body got there. But he can pull himself together about as quickly as anyone when there is work to be done. I don't know why he wears glasses, but I do know that he never looks through them when he is talking to you. His mouth opens and shuts with a determination that makes his listeners feel that when he has spoken he has said all there is to be said about that particular question. He fits in well and I have come to the conclusion that he is just about the ideal type for this kind of work here in the South.

Pat took us out yesterday to a big hog farm located up at Cairo, about twenty miles from Thomasville. This farm is owned by a man named Rodenberry, a kind of banker farmer. Although the farm is not up in good shape, I think that there are wonderful possibilities in it. It must be one of those old cotton plantations. We saw 350 hogs in one feeding lot. It was quite a sight; 350 black hogs with a white band running entirely around the body of each. Can you guess the breed, Jerry? Well, they are Hampshires, and quite attractive, too. The manager says that they have tried several breeds and this one seems to do the best. I am glad that we came out here because again it proves that the South can do things in stockraising.

You will note the picture of the mule and boy driving him that I am enclosing. I thought Bob would laugh his head off at that outfit. The poor little devil was trying to plow out the peanuts growing in between the rows of corn. I don't think that either one had any interest in the job except that each seemed to be trying to outdo the other in being about as ornery as he could. The old mule seemed to walk just where it suited his fancy the best, and the boy followed, paying more attention to swearing and cussing than he did to the kind of job he was doing. We stopped the outfit long enough to get this snapshot, and I don't know whether they ever got started again. We left them cussing each other about what we didn't regard any of our business.

On the way home, we stopped in to see a tobacco farm. I learned some things here I never knew before. This fellow had about 15 acres covered over like the picture I am sending shows. This is to furnish a partial shade for the tobacco while it is growing so that the leaves will be of better quality. It keeps them from getting too thick. I don't mean that this is to stop the leaves developing, but just to keep their tissues thin. The slats you see are only laths strung on the wires that are stretched from pole to pole. It must be quite a job to cover a field like this. The crop you see there now is the second one this year, but it is not a crop of tobacco. Cowpeas have been planted in rows. These will be cut and spread out, then plowed under for green manure. That's another advantage they have down here. Much of the land can be cropped twice a season. We saw a big field of sugar cane growing on this farm, also, in fact that picture of Pat Ward was taken in a field of sugar cane.

TO MAKE THE TOBACCO LEAVES THIN

Oh, yes, and I mustn't forget to tell you that we drove down into Florida to fish in the Gulf of Mexico. We didn't have any luck, though, but it was piles of fun just the same. You should see some of the old timers hanging around those fishing stations. I'll just bet they have never been more than ten yards away from those places all their lives. I'll tell you more about that trip when I see you again. We will be leaving here now in a couple of days. I think we will head for Ashville, S. C. That is a resort town about which we are hearing a great deal, so we think that it will be a good place to make the next stop.

This is the longest letter that I have ever written and I'm getting tired and since you will be just as tired by the time you all get through reading it, I'll just call it quits right here. We both stood the trip well, and we have had a mighty pleasant and instructive week here, but I am sure we will both be glad to see old Wisconsin again. Bob just stepped in and tells me to offer his best to you all, and also that you needn't worry about me wanting to locate down here. He says that I am cured of that wild idea. So here's trusting that you are all in good health and enjoying the new house. With much love to you all, I am

Your son,
JIMMY.

Junior Letters

Hoard's Dairyman Juniors:—I live on a 150-acre farm. We have five horses, twenty-nine cows, eight head of young stock, and two bulls. I have twenty-three chickens, three old ducks and two young ones, and seven pigeons.

We sell all our milk to an old soldiers' home—about 300 quarts a day.

I like to read the stories about Bob Ramsay and Jimmy Green. I wish some of the juniors would write to me and tell me about their ducks or pigeons. My address is Noraton Hts., Conn.
Stanton Wilson.

Hoard's Dairyman Juniors:—I live on a farm of 178 acres. I have a Holstein heifer. She is not a pure-bred but is just as nice. She is now over 9½ years old. We are now milking 28 cows. We have a pure-bred Jersey calf I feed twice a day.

I am going to have some pure-bred White Leghorn pullets. I expect to have about 12 in all.

If any of the juniors want to write to me my address is R. D. No. 1, Homer, N. Y.
Leland J. Baldwin.

Hoard's Dairyman Juniors:—We are milking 11 cows now. Two of them freshened a short time ago and we have a few more to freshen yet.

We have about 70 spring pigs and are going to have three litters of fall pigs.

We filled our silo about a week ago and are cutting the rest of our corn to shred.

I help with the chores each morning and night and milk about 3 cows. My brother and I received a bull calf for helping with the work. He is about three weeks old.

All of our cattle are registered Holsteins and our hogs are pure-bred Chester Whites.
Wisconsin. Orville Martin.

Hoard's Dairyman Juniors:—I live down in the Ozark region on a 208-acre farm. My father is a cattle and strawberry raiser. We have about 35 head of cattle. All of them are thoroughbred Shorthorns except 11 Holsteins and a couple grades. I have interest in the berries of a 12-acre berry patch next spring and then I am going to buy me a calf. I am 13 years old and I am in the 8th grade in school. I wish some of the juniors would write to me. My address is R. R. 1, Goodman, Mo.
J. E. Martin.

Hoard's Dairyman Juniors:—I am twelve years old and am in the eighth grade at school. I have a calf and a pig. My calf is a grade Guernsey; her name is Buttercup. I entered her in the calf club last year. We own 70 acres of land and rent 40 from a neighbor. We have a pure-bred Guernsey bull and fifteen Guernsey cows. We are milking fourteen of them just now. Five of them are grades and the rest pure-breds.

We have about ten acres of orchard in which we grow apples, plums, and cherries, also a few pears; two acres of raspberries, four acres of strawberries, fifteen acres in truck garden, and the rest in general farming. We have two auto trucks and a touring car. I have been reading the junior letters and was very much interested in them. I wish some of the juniors would write to me. My address is R. F. D. No. 5, Oshkosh, Wis.
Ward A. Rasmussen.

Hoard's Dairyman Juniors:—I have been wanting to write but have been very busy helping on the farm.

In your last letter you asked me about my goats and sow. My old goat had twins again but they were both billies so I sold them.

My sow had eight pigs last spring which I expect to sell about Xmas time. My sow got rheumatism so I sold her. I got $17 for her.

We are milking six cows at present.

We have got around 60 pigs and two more sows will have pigs soon.

I would like to hear from some juniors. My address is R. 2, Juda, Wis.
Andrew Mussehl.

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

FARMS WANTED

Farm Lands Wanted—Many Iowans will buy land in other states during the next few weeks. Why not sell your land to one of these buyers? Not long ago the Stoutenberg Land Company, Butterfield, Minnesota, sold three farms in a single day by our plan. Send us a complete description of the land you have for sale, the number of acres, its distance from town and school, what improvements it has, if any; how it is divided into fields; your price, terms, etc., and we will tell you, without obligation on your part, how little it would cost to get in touch with these Iowa buyers. At the same time we will send you our free booklet, "Farm Buyers and Where to Find Them". It will open your eyes. Write today, for the land buying season is on. THE DES MOINES REGISTER AND TRIBUNE, Dept. 47, Des Moines, Iowa. 16-spl

Farms wanted—Must be over 240 acres, productive soil, good buildings and fully stocked. Can handle at once. WALTER MILLER, 320 Brumder Bldg., Milwaukee, Wisconsin.

Buy Farms in New York State through the Farm Brokers' Association, Inc., an old established organization which will give you thoroughly reliable information and service. Offices throughout the state. Write the CENTRAL OFFICE at Oneida, N. Y., for a brief list and state your requirements. 8-spl

Where dairy farming is profitable—There are localities in the South where, on account of the rapid development of industrial cities and towns, supplies of dairy products are short and prices are high. In these same localities long grazing seasons and winter cover crops cut down feeding costs and all conditions are exceptionally favorable for profitable dairy farming. Good improved farms can be bought at prices much lower than are asked for similar lands in other parts of the United States. Buy a Southern dairy farm now while prices are still low, make money and build up a valuable property. Forr full infromation write to J. C. WILLIAMS, Manager, Southern Railway Development Service, 1302 Pennsylvania Avenue, Washington, D. C. 14-spl.

300-acre stock farm on main highway. Eastern Pennsylvania, 20 miles from Philadelphia. R. R. Station on corner of farm, 28 trains a day. Mansion house and four fine tenement houses. Crawford & Co., Waukegan, Illinois.

Many Separators in Kansas

HOARD'S DAIRYMAN:—A good indication of the hold which dairying is obtaining in the agriculture of Kansas is contained in the fact that cream separators are in use on three out of every five farms in the state. This was determined by a recent study by the state board of agriculture of the assessors' returns for the present year.

On March 1, there were 94,556 separators in the state, which is an increase of 35 per cent in the number in the last five years. An average of about 5,000 separators a year have been purchased by Kansas farmers during this period. Reno county leads the others in the number of separators with 2,124. Eleven other counties reported more than 1,500 of these machines.

J. C. Mohler, secretary of the Kansas State Board of Agriculture, ascribes the large number of separators in use both to the rapid development of dairying and to the constantly increasing tendency of farmers to employ more machinery in their work.

Kansas. F. M. CHASE.

Coming Events

Dec. 9-11, 1920—International Farm Congress meets at Kansas City, Mo.

Jan. 4—6, 1921, Wisconsin Cheesemakers' Association meets in Milwaukee. Secretary, J. L. Sammis, Madison, Wis.

Exchange Pennies for Dollars

It pays to invest in cow health. The cost of a package of Kow-Kare, the great cow medicine, is measured in cents; the increased milk income from a healthy cow is reckoned in dollars.

Kow-Kare enjoys a quarter-century record of leadership in the prevention and successful treatment of all cow ailments due to weakened digestive or genital organs, such as Barrenness, Retained Afterbirth, Lost Appetite, Scouring, Bunches and Abortion. The Kow-Kare treatment is inexpensive but produces prompt and visable results. One trial will convince you.

Buy Kow-Kare from feed dealers, general stores or druggists.

KOW-KARE

ABORTION IN CATTLE

CAN BE TREATED SUCCESSFULLY AND YOUR COWS MADE PROMPT REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY, Dept. A, 398-408 Columbus Ave., New York City. Reference—Colonial Bank.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Removing the Afterbirth

When a cow does not promptly expel her afterbirth the owner usually resorts to one or the other of several popular remedies, none of which can be considered reliable. The old Irish treatment is to give the cow her own first milk or colostrum, a practice that does not quite meet with the approval of those who like to make and eat biest cheese or bestyn pudding, which is a product of such milk. Another plan is to hang a weight on the protruding afterbirth, a practice that must be considered highly detrimental. Others let the cow eat six or eight quarts of whole oats at one meal when the afterbirth is retained and consider such treatment effectual; while a more sensible plan is to inject a mild antiseptic solution into the vagina at intervals of six hours until the afterbirth is expelled. To the latter plan we have no objection, but the other treatments mentioned do not seem to have any certain effect. Neither do internal remedies cause expulsion of the afterbirth.

Understanding from what has been said in a previous article that the villi of the chorion have not loosened in the crypts of the cotyledons of the womb, the necessity of manual removal of the afterbirth becomes apparent. If expulsion does not occur inside of 48 hours, after two gallons or so of bloodwarm water containing a heaping teaspoonful of table salt have been injected into the vagina at intervals of six hours, a trained veterinarian should be employed to remove the membranes. On no account should a non-expert do the work, for it is dangerous and if improperly done may ruin the cow for future usefulness.

The operation is performed as follows: After injecting into the womb a mild antiseptic solution the veterinarian puts on a thin rubber glove on his cleansed and disinfected hand, introduces it and squeezes gently each cotyledon in turn to rid it of some of its blood and so loosen the villi. Simultaneously a finger is inserted between the afterbirth and cotyledon and used to strip away the membrane. If the operation has been long delayed some of the cotyledons may come off during the work. This is inadvisable and to be prevented so far as possible. After the cotyledons of the main chamber of the womb (fundas) have been stripped clean the afterbirth running down into a horn of the womb is pulled upon to bring up more cotyledons which are stripped in turn. When as many as possible have been freed of afterbirth the veterinarian then flushes out the womb with a mild antiseptic solution, such as a 2 per cent mixture of Lugol's solution and water introduced by means of a return flow catheter. This is done until the fluid comes away clear. We also believe in swabbing the womb with absorbent cotton saturated with the antiseptic solution. The final step is to insert and leave in the womb a gelatine capsule containing iodoform and boric acid.

The old fashioned plan was to insert all the fresh, unsalted lard the hand could carry into the womb and this treatment had its good effects. Afterward the vagina should be flushed out daily with antiseptic solution and if the cow is a fine animal it will pay to have the veterinarian treat the womb a few times until found healthy. If the work is not well done, or done in such fashion that infection occurs, pyometra and sterility will result.

Barrenness

We have a heifer that freshened with her first calf last November. We delayed breeding, thinking it would give her a chance to grow. She came in heat regularly until the last two months. I have not seen her show any signs. We have not had any bull around the herd so I am certain that she is not with calf.

Nye, Wis. B. H. W.

As soon as possible have a trained veterinarian treat her womb and ovaries. That will be most likely to bring on a period of heat. Meanwhile syringe out her vagina daily with lukewarm water containing a heaping teaspoonful of salt to the quart and feed her generously on oats.

Blood in Milk

We are having trouble with a herd of 18 head of dairy cows. All of them gave bloody milk but 3. The only place we can find it is in bowl of separator. Every cow seems in perfect health giving a good flow of milk and eats everything you give them.

Orlando, Fla. W. A. S.

One cow may be to blame for the entire trouble. Set a sample of milk from each cow in separate sterilized vessels. By this means you may be able to detect the affected cow. It may be a heifer that recently has had her first calf, or a cow suffering from chronic mammitis, or one that has growths in a teat which bleed from irritation at milking time. Red color of milk may also be due to the bacillus prodigiosus, a germ existing in milk utensils.

Pining Cow

I have a fine cow which last year gave five gallons of milk a day. Last April she freshened again before grass came and gave four gallons a day. Two months later she started falling off in milk. Every few days she would have a spell of staggering as though she were drunk. She appeared very nervous during these spells. She kept falling off in milk until now she only gives about 3 quarts of milk daily. Does not have any more spells now but is still very thin in flesh.

Mattoax, Va. L. A. L.

Both cow and calf probably are afflicted with tuberculosis. You might as well kill the calf at once and make a careful examination and report findings to us, if you cannot have a qualified veterinarian present at time of examination. You should also have the cow tested with tuberculin and dispose of her according to state law, if she reacts. Meanwhile keep her isolated and do not use the milk. If she proves to be tuberculous you should cleanse, disinfect, and whitewash the stable. If she is not tuberculous she may be afflicted with traumatic pericarditis caused by swallowing a sharp object such as a wire, nail, or pin. Infection of the womb would be another possible cause.

The Corn Song

Heap high the farmer's wintry hoard!
Heap high the golden corn!
No richer gift has autumn poured
From out her lavish horn!
So let the good old crop adorn
The hills our fathers trod;
Still let us, for His golden corn,
Send up our thanks to God!

Let other lands, exulting, glean
The apple from the pine,
The orange from its glossy green,
The cluster from the vine;
We better love the hardy gift
Our rugged vales bestow,
To cheer us when the storm shall drift
Our harvest fields with snow.

Thro' vales of grass and meads of flow'rs
Our ploughs their furrows made,
While on the hills the sun and showers
Of changeful April played.
We dropp'd the seed o'er hill and plain,
Beneath the sun of May,
And frightened from our sprouting grain
The robber crows away.

All thro' the long bright days of June
Its leaves grew green and fair,
And wav'd in hot mid-summer's noon
Its soft and yellow hair.
And now, with autumn's moon-lit eves,
Its harvest time has come,
We pluck away the frosted leaves,
And bear the treasure home.

Let vapid idlers loll in silk
Around their costly board;
Give us the bowl of samp and milk,
By home-spun beauty poured!
Where'er the wide old kitchen hearth
Sends up its smoky curls,
Who will not thank the kindly earth,
And bless our farmer girls!

(From the notebook of student at the Wisconsin Short Course of 1897, Author Unknown.)

Corn Cannery Refuse

HOARD'S DAIRYMAN:—The canning of sweet corn is now an important industry and it leaves a large quantity of refuse, consisting of shucks, cobs, and other portions of the corn plant, as well as imm-ture and overripe ears or ears that have been spoiled from any cause. Large amounts of this material have been fed in the past but in some districts a considerable proportion of it has been allowed to go to waste. Recently the interest in this material has been increasing and many questions are now asked regarding its value. In view of the lack of information regarding its use as a feed for live stock a digestion trial was undertaken in the Dairy Husbandry Section of the Iowa Agricultural Experiment Station. Such a test does not give all of the information necessary regarding a feed but the results obtained show the need of giving greater attention than is at present devoted to the utilization of this product which is too often wasted.

The digestion trial was conducted with two cows which were fed for a time on corn cannery refuse as the sole ration. The refuse was obtained from a local factory and was about two days old when used. It had generally fermented to some extent, had an offensive odor, and was not in first class feeding condition. It consisted largely of shucks of the sweet corn as the spoiled ears and cobs went into separate piles.

Table I—Composition, Digestibility, and Digestible Nutrients of Corn Cannery Refuse

Nutrients	Composition %	Digestibility %
Moisture	83.28	
Dry matter	16.72	31.9
Crude protein	1.32	7.7
Nitrogen-free extract	9.17	39.9
Crude fiber	5.02	24.4
Crude fat	.34	42.5
Ash	.87	

The amount of dry matter present in the corn cannery refuse was small, only 16.72%, and but 31.9% of this was digestible. The nitrogen-free extract was the most abundant constituent of the dry matter, constituting more than one-half of it.

A better appreciation of the value of the corn cannery refuse can perhaps be obtained by comparing it with corn silage. For this purpose the values for corn silage and corn are taken from Feeds and Feeding, by W. A. Henry and F. B. Morrison.

Table II—A Comparison of Corn Silage and Corn Cannery Refuse

Nutrients	Digestible nutrients in 1 ton Corn silage Lbs.	Cannery refuse Lbs.	Cannery refuse and 5 bus. corn Lbs.
Dry matter	348	106	357
Crude protein	22	2	23
Carbohydrates	300	98	291
Fat	14	2	15
Total	354	104	348

If the corn cannery refuse is compared directly with corn silage, it does not appear to be of much value as it contains about one-third as much total digestible nutrients and only one-tenth as much digestible crude protein as does the corn silage. If, however, five bushels of corn, which is the average amount contained in one ton of silage, be added to a ton of cannery refuse, it is found that its feeding value is then practically the same as that of a ton of silage.

This gives a good indication of the relative value of the corn cannery refuse and shows that it should not be wasted. Dairymen who are located near corn canneries will find the refuse a valuable source of succulence. Many are using it at the present time though it is frequently handled in a haphazard manner. Some allow it to lie in dumps as it comes from the cannery but this is wasteful as a large amount of the material spoils; others put it up in more regular piles and this reduces the surface waste to a considerable extent; still others put it in the silo and this is undoubtedly the most satisfactory method of saving it.

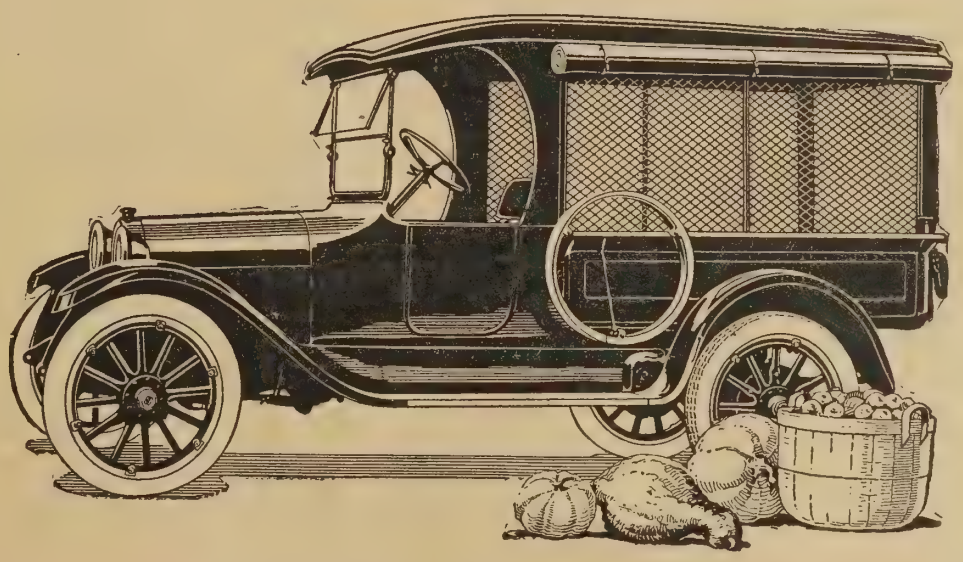
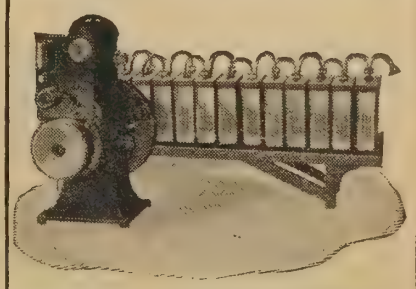
DODGE BROTHERS
BUSINESS CAR



During the war the shell-torn roads of France advertised to the world for all time the wonderful strength and powers of resistance in Dodge Brothers construction.

The Business Car embodies this same splendid sturdiness and ability to stand up under continued hard use, on and about the farm, and to and from town.



It has a universal good name for infrequency of repair and unusually low cost of operation.

Every inquiry you make will convince you that it is ideal for farm use in point of size, weight, capacity, low cost of haulage and long life.

Next Summer—You'll want to wear Hanes Nainsook Union Suits!

Dairy Herd Management

In a previous issue we published the report of the trip certain Oklahoma farmers took to Wisconsin, and below we give their story of three of the farms visited:

"Mr. W. M. Nelson's herd is mostly Guernseys. He owns 80 acres and rents 100 acres. In 1919 milked 19 cows, grade Holsteins and Guernseys. Is turning to the Guernseys because he expects to sell whole milk to the town trade. Now sells cream to ice cream factory. Ten years ago had a herd of milking Shorthorns. They proved unprofitable. He changed to grade Holsteins. Three years ago he began changing from Holsteins to Guernseys, and expects soon to work into the pure-bred Guernseys exclusively. Just recently installed entire barn equipment, including modern stanchions, stalls, milking machine, Delco light system, steam boiler, etc. His stanchions and stalls cost about $1,100.00, installed. His herdsman is a boy 22 years old who has worked for him nine years. This young man spends his whole time taking care of the cows. Last year Mr. Nelson bought a registered heifer Guernsey calf and gave to this boy. He paid $165 for it. It will come fresh soon and is valued now at $250.

"Mr. Nelson practices growing sweet corn. In 1919 he had 12 acres of sweet corn, the large Golden Bantam variety. He picks about half the ears, selecting the best ones, and sells them at Oshkosh. His income for 1919 was about $1,400 from this source. He then harvests the entire crop and puts it into the silo. Thinks in this way he gets about two-thirds as much ensilage as though he sold no roasting ears. He plants this sweet corn very thick.

"His income from cream is now about $200 a month from 16 cows, part of which are dry. He has a separator which he runs by gasoline engine. He thinks skimmilk is worth about $1.00 per 100 pounds in feeding calves and pigs. He thinks there is no material difference in Guernseys or Holsteins, if one is going to sell whole milk to cheese factories, condenseries, or to the ordinary town trade. Thinks Holsteins are more rugged and will use profitably a greater proportion of roughage. He is going into the Guernseys because he wishes to cater to the better town trade.

"He keeps a few hogs rooting in the manure pile at the rear of the barn. Says hogs practically live from what they get from the manure pile.

"Mr. Nelson's stanchions are so arranged that cows face outward from the center aisle. As in practically all dairy barns in Wisconsin, the barn floor is of cement. The surface of the center aisle is corrugated, the corrugations being in imitation of cement blocks of 4x8 inches. This tends to prevent slipping on a smooth floor.

"Mr. Nelson, in addition to the herdsman, has a middle-aged man who has been with him eleven years. These men are up at 4:45 each morning and begin milking at 5:00 o'clock. They also begin milking in the afternoon at five o'clock. They are through with their chores at 7:30. The boy herdsman says Guernsey cows are easier to milk than Holsteins. Says they sell Guernsey calves to the butcher at 4 to 5 weeks old; Holstein calves at three weeks."

"Feeds heifer calves five pounds or over of whole milk at a feeding, twice a day for three weeks. They are then put on skimmilk for about seven months, giving about ten pounds as a feed for Guernsey calves and twelve pounds for Holsteins. The boy says one man can care for 20

"I bring Better Butter Prices – because I keep Butter Better"
Paterson Parchment

More Profit From Butter

No matter how good *you* consider your butter, your *customer's* opinion governs the price you get for it.

Butter is always fresher, sweeter, cleaner and more salable when it reaches your customer wrapped in

Paterson Pioneer Parchment Paper

cows and 10 heifers and do the milking by hand. With a machine, one man can take care of 30 cows. By this he meant that one man could take entire charge of the herd, including milking, separating the cream, feeding, currying and brushing the cows daily, cleaning the barns, and putting down fresh bedding, etc."

H. R. Mosley

"Mr. Mosley owns 120 acres, valued at $20,000.00, and is president of the County Guernsey Breeders' Association. In 1919 he milked about 16 cows, one-half being pure-breds. Has a very excellent 3-year-old bull with records back of him on both sides of from 500 to 800 lbs. butterfat. Sells cream to creamery. Feeds skimmilk to pigs and calves. Thinks skimmilk is worth 50c to 75c per 100 lbs. The cream he sells tests from 20 to 25% butterfat. He is now getting 76c a pound for butterfat. In November he got 71½c a pound. The average test of his herd is about 5% butterfat. He says when cows are shedding the butterfat test is apt to drop somewhat.

"In 1919 he milked 16 cows, about half of which were pure-breds. Prefers heifers to come fresh at about 28 months old. Likes cows to be dry about six weeks. If they are to be put on official test, they should be dry three months. Feeds his cows about 1 lb. daily for each 4 lbs. of milk produced, from the following ration:

"In a mixture of 100 lbs., there will be 20 lbs. gluten, 40 lbs. bran, 30 lbs. ground oats or barley, 10 lbs. oil meal. In addition, all the hay and ensilage the cows will clean up. Likes cows to come fresh in fall.

"Lets calves run with the cows freely for from one to three weeks. This gives them a good start, which is important in the producing of vigorous calves. Then gives about 3 lbs. of whole milk twice a day until calves are 4 to 5 weeks old. Would be still better to feed calves three times a day. Gradually change to skimmilk in a week, and increase the feed to 10 lbs. of skimmilk twice a day, and continue feeding skimmilk until the calves develop, but is better to continue feeding skimmilk until calf is 10 or 12 months old. Also, feed calves grain and hay. Usually keeps calves up through pasture season, but will permit early fall calves to go on pasture. He thinks grass and milk are an unbalanced ration for calves and cause scours. A variation in pasture through the summer is apt to stunt the calves.

"Mr. Mosley's crop rotation is: First year, meadow, (with coating of manure as topdressing); second year, corn; third year, grain (oats or barley).

"He puts about 15 loads of manure to the acre."

Lois Sorenson

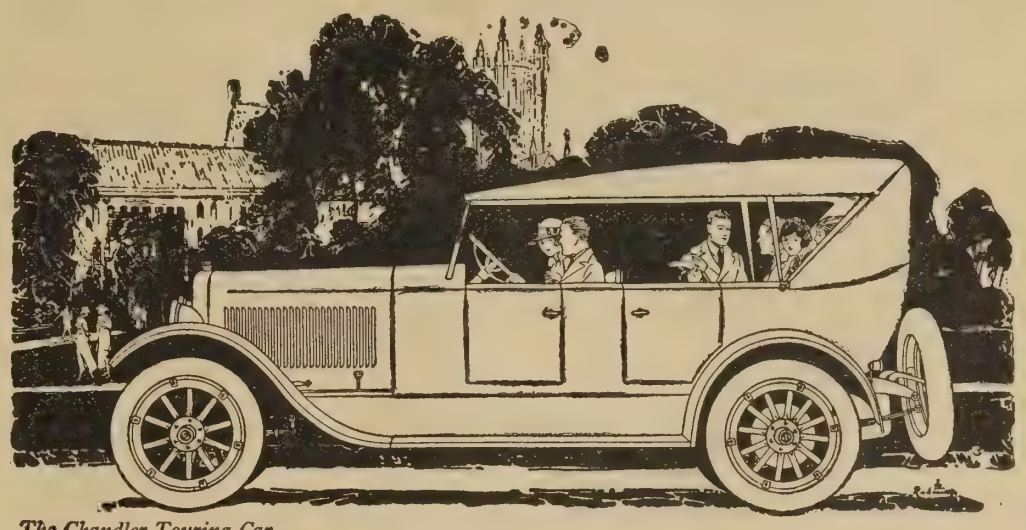
"Have lived here seven years, own 103 acres of land, bought seven years ago at $13,000. It is worth now $16,500; all under cultivation. Have been milking from ten to seventeen cows. Have had fully registered Holstein herd for only three months. Started three years ago to build a registered herd. Have now seventeen head of registered stock over eighteen months old. I do not recommend registered stock for a beginner in dairy work. I have belonged to the cow testing association for three years. This association is a great benefit to the farmer in keeping account of individual cows. I do not use machine because I have plenty of help to do hand milking. I have no objection to machine if handled right.

"Received in December $3.58 per hundred pounds for whole milk sold at the cheese factory, received nothing back. Average test 3.8%. I sell the whole milk to the cheese factory. I figure that I will make more on sale of stock on a registered herd than from the sale of milk. I have started to raise Duroc hogs.

"The following taken from the reports of cow testing association are for a period of nine months:

Month	No. cows	Income	Feed	Profit
March	10	$312.55	$112.00	$300.55
April	12	275.40	110.00	165.40
May	8	249.22	104.00	145.22
June	9	267.40	34.38	233.02
July	10	271.20	72.50	198.70
August	10	267.20	72.50	194.70
September	11	269.20	77.00	192.20
October	7	95.75	23.80	71.95
November	8	192.80	100.40	92.24

"Cows on pasture beginning June. October's small production indicates cows dry.



"Milk all cows twice a day. I measure grain to each cow, giving one pound of feed to four pounds of milk. A mixture for feed per five hundred pounds as follows: Bran, 200 lbs.; gluten, 100 lbs.; ground oats, 100 lbs.; oil meal, 50 lbs.; cottonseed meal, 50 lbs.; and 2½ lbs. salt to 200 lbs. feed.

"I usually feed thirty pounds silage daily. Prices of feed are: Hay, $20 to $25; marsh hay, $10; straw, $68 per ton; ground oats, $50; gluten, $52 to $55; oil meal, $72; bran, $42.

"The following is a report taken from the cow testing association records for the year April, 1917, to April, 1918, inclusive. Record shows average of twelve cows for the year: Milk, 6,600 lbs.; butterfat, $248; average test, 3.75; value of product, $147.00; cost of feed, $70.00; profit, $77.00. Returns for each one dollar spent for feed, $2.16. Average price of butterfat during this year was from 50c to 66c."

CHANDLER SIX

Famous For Its Marvelous Motor

The Chandler Touring Car

It Offers So Much More For So Much Less

The Chandler price has always, regardless of the demand, been based on cost of production plus a fair profit and nothing else. An oversold condition of the trade has never moved the price up. And today, the Chandler is, by long odds, the most closely-priced fine car in the American market.

Chandler holds its leadership among Sixes so distinctly because it offers so much more for so much less.

It leads because of its endurance and great motor, unsurpassed for flexibility of power.

It leads because of its sturdy construction throughout and the character of service it renders to more than eighty thousand owners.

Chandler bodies are of handsome design, roomy and comfortable. The open cars are upholstered in genuine hand-buffed leather, the closed cars in silk plush.

There is a Chandler dealer somewhere near you. See him or write us for catalog

Damage By Breachy Bull

HOARD'S DAIRYMAN:—As to damages due owner of cow that has been bred by a trespassing bull, I will state that courts allow such damages. It is for the jury to decide, after considering the breeding of the cow and bull, value of calf as bred, and value of calf if cow had been bred to the bull used by owner of cow. If you write Professor of Damages at your state University Law Department he will give you an interesting review of the decisions.

FAIRBANKS-MORSE "Z" FARM ENGINES

As Clean Cut as a Thoroughbred

The clean-cut business-like design of the "Z" Engine was not just accident. A farm engine, to be efficient, *must* be properly designed. The "Z" has graceful, natural lines—free from geegaws.

The parts are strong—weight where weight is needed. Strains foreseen—contact parts case hardened—*all* parts carefully, precisely made by accurate machine work.

Looks like a thoroughbred—*is* one. Delivers a steady flow of power—runs smoothly—operates economically. Correct design and precision methods give the "Z" its built-in quality. It is a mighty pleasing engine to look at.

Other "Z" features are: Runs on kerosene, as well as gasoline; Bosch magneto; more than rated power; parts interchangeable; long life.

Let your nearby dealer show you why you should have a "Z."

Inventions and Appliances of Interest to Agriculture

Vineyard Plow

Between the rows in a vineyard or hopfield, the soil is plowed toward the centre one year, and toward the rows the next and deeper at the center than at the sides. For this purpose the gangs on this plow are interchangeable, to plow toward the

center or the reverse, and are quickly adjustable as to depth and width. (Holt Manufacturing Co., Stockton, Cal. U. S. Patent, 1,333,811).

Hay Loader

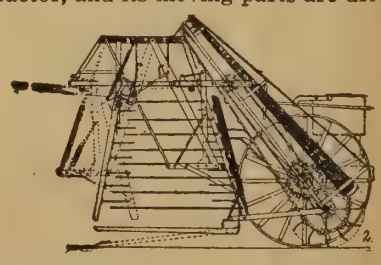
The "float" on a hay loader retains the hay on the carrier, but if the top is rigid the whole float rises over a bunch of hay and parts of it do not perform their function; to overcome this, the top bar here is flexible, and

permits the whole float to work properly, no matter how the hay is bunched.

(Thomas Mfg. Co., Springfield, Ohio, U. S. Patent, 1,319,724.)

Stack Ventilator

The ventilators here are sheet metal pipes perforated with many holes. The large central pipes are fixed rigidly in the ground; the stack is built up around them; and the smaller lateral pipes are inserted, at the proper



times, in slots in the central pipes which allow for the settling of the stack.

(R. A. Doles, Eddyville, Ky., U. S. Patent, 1,286,562.)

Hay Rake and Cocker

This machine rakes hay from a swath or windrow, elevates it into a conical cock forming cage, and discharges the finished cock from the bottom of the cage. It is hauled by a tractor, and its moving parts are driv-

en by power from the tractor. It and the tractor are operated by one man.

(International Harvester Co., Chicago, Ill., U. S. Patent, 1,331,482.)

Forage Poisoning

For a number of years the American veterinary practitioners have observed a disease in cattle which has not been definitely associated with a specific cause. Much conjecture and many theories have been advanced relative to the development of the disease yet the evidence seemed to point to the feeds affected animals consumed. Molds, chemicals, changes in the feed and even animal parasites have been mentioned as probable factors. In many instances where horses were fatally afflicted cattle consumed the same feed with impunity. Rusk's and Grindley's obserations in this connection have been repeatedly confirmed by the writer.

In 1916 the Kentucky Experiment Station demonstrated conclusively that one type of forage poisoning in horses was caused by germs resembling B. botulinus. Contaminated feeds were fed to horses and small laboratory animals with convincing results. Furthermore, the disease could be induced at will with artificial cultures isolated from the feed. These investigations threw the first true light on forage poisoning in horses, and it seems quite probable in the light of recent evidence that the same microorganism might be an etiologic factor in so called forage poisoning in cattle.

During the past twelve months feed and intestinal contents from nineteen affected herds located in twelve different counties in Illinois were received for examination. A disease resembling forage poisoning in cattle had occurred in each instance and the veterinarian requested verification of the diagnosis. Different feeds were submitted, including silage, oil meal, calf meal, and bovine stomach contents. Bacteriological examination of the specimens enumerated revealed the presence of a pathogenic organism culturally and microscopically characteristic of B. botulism in samples from eight of the nineteen outbreaks.

Bacteriological findings of suspicious feeds in outbreaks of food poisoning emphasize the prevalence of this organism and the probable extent of the disease in cattle. It is presumed from the evidence at hand that B. botulinus is widely distributed in nature and may be an important etiologic factor in causing one type of forage poisoning in cattle. If this conjecture is correct it is further believed that feeds may frequently become contaminated and if stored under suitable conditions development of the virulent toxin may follow. In the light of present knowledge it appears that one type of bovine forage poisoning is associated with B. botulinus. The symptoms of botulism in cattle often assume a chronic character and may not be readily recognized unless associated with acute cases. In two outbreaks botulism in cattle was incorrectly diagnosed as hemorrhagic septicemia. Botulinus antitoxin for the prophylactic treatment of exposed animals may be secured from the Laboratory of Animal Pathology, University of Illinois, Urbana, Illinois.—H. R. SCHWARZE, Associate in Animal Pathology.

"Mold spots all through the silo." This is probably due to the corn being so dry when ensiled that it did not ferment quickly and thoroughly enough to use up the air contained in the cut corn.

Worthless Farmers

(Continued from page 793)

hides is an economic condition that is so drastic that it will prove almost disastrous to everybody. To prevent this, thousands of live farmers have supported, and will support, granges, farm bureaus, the American Federation of Farm Bureaus (our chiefest and best hope), and countless local, co-operative associations.

In New York State, our greatest economic organization, the Dairymen's League, is facing a crisis. Its continuation depends on the loyalty of its members and the inclusion into its membership of the milk producers who are now parasites of the worst type. If these men could only realize how much good they could do by "coming in" and how dangerous they are to themselves outside, they would become members. Some day the goose will be killed. Possibly the loss will be the necessary lesson.

How we do sympathize with the milk producer who will not join the League because he does not believe in starving babies. How we honor the fellow who says, "Yes, it's a good thing, but I'll wait and see how it works out." How we love the man who is legally a member, yet actually an assassin of his association. But, how much we do think of the man who is there with the good word, the truehearted support, the desire, courage, and nerve to do what must be done to insure success. This last is the kind that makes us try it again; the kind that in every way outweighs the other kinds.

New York. W. J. HAGAR.

Soil Experiments Point Way to Larger Profits

The University of Missouri College of Agriculture has established methods of treatment whereby larger profits may be gleaned from Missouri's cultivated soils. Since 1905, thirty soil experiment fields have been operated for varying periods on a number of the important soil formations in the state. Data from all these fields operated three or more years, and covering fourteen cropping seasons, show:

1. Finely ground limestone brought an average gross return of $10.08 for each ton applied in a rotation of corn, oats, wheat, and clover or a net return of $6.08 a ton.

2. An application of 300 pounds of steamed bonemeal divided between corn and wheat in a corn, oats, wheat, and clover rotation brought a gross return of $31.86, or a net return of $25.46 an acre.

3. An application of 400 pounds of acid phosphate divided between corn and wheat in a corn, soybean, wheat, and clover rotation brought a gross return of $25.70, or a net return of $20.30 an acre.

4. An application of 100 pounds of muriate of potash divided between corn and wheat in a rotation of corn, oats, wheat, and clover brought a gross return of $7.35, or a net return of $2.35 an acre.

5. Eight tons of average barnyard manure applied to corn in a corn, oats, wheat, and clover rotation brought an increased return of $32.04 or $4.00 a ton of manure. With the cost of applying estimated at $1.25 a ton, the net return was $2.75 a ton.

6. On the basis of per cent increase on the money invested, the treatments have averaged during a four-year rotation: Limestone, 152 per cent; bone meal, 397 per cent; acid phosphate, 362 per cent; potash, 46 per cent; manure, 220 per cent.—Missouri Agricultural College News.

AYREDALE STOCK FARM, Bangor, Maine

JERSEYS

More Udder—Less Cow!

YOU don't feed a hulk when you feed a Jersey! A 1000-pound Jersey will usually produce more butterfat than a 1400-pound cow of other breeds. More udder and less cow is a mighty important item in cow profit.

The butterfat production per year of a Jersey often exceeds her live weight!

Have you read the story of Plain Mary, the World's Champion Jersey? Her two farmer-owners kept her in an ordinary barn with the temperature at times over 40 degrees below zero. But Plain Mary made a world's record never-the-less.

Any man can make profits with Jerseys. They are the cows for the working farmer. Write today for the full story of Plain Mary and other valuable information which we will send you free.

Heifer Calves on the Hoard's Dairyman Farm

These young ladies are all the get of Anton's King Confidence 43517. They are not for sale at any price. Our object is to let you know the type and style of offspring this great bull is getting us.

MaChere Confidence, the dam of A. K. C., made 764.65 lbs. of fat as a junior 4-year-old. We are now offering bull calves, some ready for service, sired by him. We appreciate your inquiry.

Hoard's Dairyman Farm
Fort Atkinson - - Wisconsin

Attention —
Guernsey Breeders or Prospective Breeders!

We have for sale some very high class cows that would make a great foundation for prospective Breeders, or they would make a very valuable addition to any herd.

Most of the cows have splendid A. R. records, or records in the making.

If you are looking for something of the highest quality in Guernsey breeding you cannot do better than write us.

We also have several young bull calves sired by the great bull, "Cherub's Prince", whose progeny won all the highest honors at the 1920 National Dairy Show.

Address all inquiries to Percy Jones, Farm Superintendent, Iowa Dairy Separator Company.

W. W. Marsh - - Waterloo, Iowa

Do You Want A Guernsey Bull

Closely related to Pergue's Crescent A. R. with a record of 13,316.9 lbs. milk and over 582 lbs. fat in Class EE and dropping two calves within the year, entitling her to second place in her class? Some excellent young bulls closely related to Pergue's Crescent ready to head your herd. Write for descriptive circular, or come and see them.

Ernest W. Sass, Box H, Streator, La Salle County, Illinois.

Spare the Cultivator and Spoil the Crop

HOARD'S DAIRYMAN:—A man about to leave the business of farming remarked that farming was a gamble. I have seen instances where crop yields in proportion to the labor expended in producing them seemed to bear out the luck proposition. I have seen corn planted on sod about June first and given only three cultivations, yield thirty or forty bushels per acre. On the other hand, I have seen fields of corn tended carefully that yielded very little hard, mature corn. Yet neither of these cases were matters of chance. The factors that largely determined the above results were a good soil quite clean of weeds in the one case and an unusually hot and dry summer in the other instance.

It is surprising to see the small gulf that lies between success and failure. This was very forcibly and clearly demonstrated to me today when I was cutting corn and noted the difference in both yield and quality of corn in different parts of the field. On the north side of the field my daughter had part of eight rows as her plot of corn for the county club work. Beyond these rows to the south was the rest of the field. Of course the cultivator was kept going pretty steadily in those rows of which the corn plot formed a part; and besides that my daughter used a hoe and pulled any audacious weed that dared show its ugly form. The rows to the south of the plot got no hoeing but received the benefit of fair cultivation—except the half dozen rows on the extreme south side. For some reason or other—either the day was too short or it was left for a more convenient season—these rows were left twice as I recall it now, and consequently received two cultivations less than the middle portion or average rows of the field.

And now for the results: Ten ears selected from the corn club plot won second place at the county fair. They were sent in to the state fair held at Salem the next week, distancing their former competitors and winning second place at the state fair.

The middle rows of the field were just average; but no one need to be told which rows the cultivator had skipped twice. The half dozen or so rows, with their smaller ears, kept pointing reproving fingers at me saying: "You spared the cultivator and spoiled our chance in life."

Oregon. SUBSCRIBER.

Juneau Co. (Wis.) Holstein Sale

The Holstein Breeders' Association of Juneau County held their first annual sale at Mauston, Wis., October 26, selling 46 animals for an average of $266. Three of these sold for $1,000 or more, two tieing for top price honors at $1,250. H. A. Thompson, Wisconsin, purchased one of these, Diamond Gift Elgin 2d. The other, Mountain Ash Belle, a three-year-old now doing very well on year test went to R. Ritchart, also of Wisconsin.

J. E. Mack did the selling with F. H. Everson, sale manager, in the box.

Following is a list of all animals selling for $300 or more and buyers of same:

M. W. Riddlestine, Wisconsin	
Lady Johanna Senator Plebe	$500
Clothilde Pauline Beauty	625
L. O. Larson, Wisconsin	
Appoline Johanna 2d	$600
Guy Carter, Wisconsin

E. P Warme, Wisconsin	
Segis Cornucopia De Kol Spofford	$350
Kuff Bros., Wisconsin	
Daisy Michals De Kol 2d	$300

Profitable farming is a matter of business and farms can be most successfully operated only on a sound business basis.

Green Co. (Wis.) Holstein Sale

The Holstein breeders of Green County, Wis., held their semi-annual sale at Monroe, Wis., October 28—29, a most unfavorable time because of the present market milk slump in that section.

They sold 155 head for a total of $26,740 with $400 the top price. Truttschell Bros., Wis., paid this for a very good five-year-old cow consigned by Samuel Ulbert.

At the same sale 12 calf club calves were sold for an average of $229.

Hager, Eells, and Hellen did the selling with Wood in the box.

Following is a list of all animals selling for $250 or more and buyers:

H. A. Hugelshofer, Illinois	
Zur Fayne Hamilton 2d	$360
Grace Vineyard	375
J. P. Ames, Wisconsin

SWINE

Hitch Your Wagon to a Star

Tie Your Herd to the Proven Success of

Epochal Berkshires

Get a Herd Sire or a Foundation Trio

From the herd that has won more first prizes and more championships at the biggest shows this year than all its competitors put together.

Some statement, but it's true!

The Epochal Herd won 62 firsts out of a possible 106 and 23 championships out of a possible 42 at the 1920 Missouri, Illinois, Iowa, Indiana, and New York State Fairs, the Eastern States Exposition at Springfield, Mass., and the National Swine Show.

The Epochal herd won in 1919 and 1920, 429 prizes; 140 firsts, 44 championships, and 14 grand championships. This is more prizes, more firsts, more championships, and more grand championships than were ever before won in two consecutive years by any one Berkshire herd in the world.

Young boars that are herd sire prospects of the kind that lift strains to the top, $200 each and up. Trios of six months old pigs carefully and properly mated—a real foundation—$300 to $2,500.

The services of our experts will start your herd "right"; and will save you years of time in achieving success in your breeding operations. Write us. You will like the way we help you!

Epochal Berkshires are the deepest and smoothest big-type hogs.

Martinsville, Ind. Preston, Kans. Axial, Colo.

GOSSARD BREEDING ESTATES

Pure-bred Duroc Jersey Gilts and Boars

We are now offering for private sale some good young boars and gilts. These are priced to sell. All of our stock is immune from cholera.

H. W. and Wm. Watts, Leland, Illinois

Early to Market—Full Weight

51 per cent of all hogs marketed in the United States in 1918 were Duroc-Jerseys.

Duroc-Jersey hogs have proved themselves in championship shows as well as on the market.

Duroc-Jersey hogs raise large families and put on weight quickly. They are hardy, easy feeding animals that mature at an early age, and are uniformly red in color.

Box 253. Cortland, N. Y.

Holstein Bull For Sale

Born Feb. 11, 1920; nearly all white, fine individual, well grown. Sire—a 29.9-lb. proved son of King of the Pontiacs. Dam—a 22.6-lb cow of splendid dairy type that has produced 80 lbs. of milk a day. Price $200 F. O. B. Sherburne. Inspection invited.

Edwin P. Smith, Sherburne, N. Y.

Young Bulls Backed By Yearly and Seven Day Records

We have for sale a few young bulls, up to 11 months old that are sired by our senior herd sire Finderne Pride Johanna Korndyke. He is one of the best sons of King Segis De Kol Korndyke and from Finderne Pride Johanna Rue, former world record cow with 1470 lbs. butter in 1 year. These youngsters are well grown and are all from A. R. O. dams with records up to 30 lbs. Write us for full information. We will answer promptly.

ANTRIM FARMS, - - - SYRACUSE, NEW YORK

WE Want You in—

Watertown, Wisconsin

Next Tuesday, November 23

Because we know we can please you — satisfy you — make you money. We know we can do this because we have selected the sort of Cattle that you and all discriminating buyers seek.

We would call your attention to the following outstanding features of the sale.

1. Our cattle come from clean, long established herds — no jobber herds.
2. Our cattle have been inspected by competent men; the undesirable rejected.
3. Our cattle are bred by responsible men — men who have made our sales what they are. We select our men as well as our cattle.
4. A very attractive lot of bulls, with royal pedigrees, makes the sale especially interesting to those seeking herd sires.
5. We have a large percentage of springers and fresh cows.
6. A large portion of the cattle have been insured under the 60-day plan. This relieves you of worry after the sale.
7. In buying from the Watertown Sales Co. you are patronizing a tried, proven quantity as opposed to a sporadic sale venture, launched merely to unload, with no thought of the future. We are in the business to stay and appreciate that square dealing alone insures longevity in the sale business.

Send for a catalog and be convinced that we have a very attractively bred lot of cattle and then come to the sale and satisfy yourself that the cattle are individually square with their breeding.

Francis Darcey, Secretary, Watertown, Wis.

A Son of King Bess

from an A. R. O. granddaughter of Colantha Johanna Champion will suit you for a herd sire

Here's one from Johanna Rutena 3d, a 23-lb. junior 3-year-old that is one of the best long time prospects we have. Her dam, a daughter of Champion, has 30.37 lbs. as a 4-year-old and is now going at better than a 1,000-lb. rate on year test.

King Bess is from a 33-lb., 1,235-lb. daughter of S. P. O. M., so that in the 5 generation pedigree of this calf, every dam has over 22 lbs., 10 have over 30 lbs. in 7 days, 7 have year records, 4 above 1,200 lbs. and 5 over 1,000 lbs.

The calf is a dandy, straight, four-fifths white and well grown. He was born March 8.

Write or wire today about him.

Waukesha - - - Wisconsin

Harvest Farms Company

will sell at

Watertown, November 23

Harvest Sir Ormsby (114268)

The second best full aged individual bull in the state, being second to the wonderful Baird bull at Wisconsin State Fair 1920. We recalled this bull to use on a few of our own herd and to go with our herd to the State Fair. It may seem futile to offer a seven-year-old bull in a public sale but whatever price he may bring we shall feel that we have done the Holstein industry of the state a benefit if we can succeed in putting him at the head of some herd where individuality is desired. This bull has been used in a small herd of indifferent individuals and yet every calf he sired has the same individuality, the same dairy type as has this sire and they are remarkable producers at the pail. Not only is he himself a good producer of good individuals but he comes from a family of good individuals. His full brother, at the head of the Otto Brandt herd at Horicon, has gotten young stuff that win at shows and that sell excellently in the sales. This bull is not only a good individual but he is backed by some of the very best of the old time breeding. His dam, Harvest Pet Ormsby made 22 pounds at two years old, she freshened in the summer after that record and was never put on test but once when with twin calves, she made a record of 24 pounds. Her dam was Pet Douglas 4th Brightest, one of the really great transmitting dams of the breed. One of her daughters is now State Champion in the Junior 3-year-old class with over 32 pounds. Another daughter stood a three-year-old record of 27 pounds. We have five undeveloped females of this family still on the farm, they are all being developed.

The sire of Harvest Sir Ormsby is a 20-pound son of Paul Beets De Kol, whose dam, Sethje Golden 2d, made her record of 20 pounds at New York State Fair on the grounds at the age of twelve after she had been made champion of the Fair. She has one 30-pound daughter, Sethje Golden Nannette.

He is active, sure and is sold guaranteed to be a Breeder for one year. Our aim in recalling this bull was to put him in some herd where his splendid properties might be retained.

J. P. Riordan, Manager - Mayville, Wis.

Cedar Lawn Farms

Headed by

General Ormsby Colantha

Both grandams of this young bull made above 1,235 lbs. butter in 1 yr. 6 dams made above 30 lbs. butter in 7 days. 5 dams above 33 lbs. butter in 7 days. 7 nearest dams average 30.19 lbs. butter in 7 days. 15 nearest dams average 27.44 lbs. butter in 7 days. He is a direct descendant of Miss Korndyke Maid Ormsby, Bess Pietertje Ormsby Mercedes, Spring Brook Bess Burke, Colantha 4th's Johanna and Pietertje Maid Ormsby. Sons of this bull out of A. R. O. dams up to 30 lbs. for sale.

25 Holstein Cows For Sale

or exchange. 23 are high grades, 2 are registered. Also my herd bull, a grandson of K. S. P. A., the $50,000 bull. This bull is from a 27-lb. cow. Most of the cows are bred to him. All are young cows, well marked, heavy producers. Price, $200 per head if entire herd is purchased.

Will take 2 good teams of draft mares or mules as part payment or might consider a good used automobile as partial payment.

G. A. HIGGINBOTHAM, Rossville, Kas.

Illinois Holsteins—The Cattle to tie to—The best investment for your foundation

Stephenson County Association

HOLSTEIN SALE

Freeport, Illinois

Wednesday, Dec. 1

65 Hand Picked Holsteins

Guaranteed and subject to 60-90-day re-test

These Cattle were carefully selected from the choicest animals in the herds of Stephenson County's progressive breeders. The selections were made by Mr. Fred Morrison, Jr., proprietor of Harkland Farm, Bayle City, Ill., and a Committee from the Stephenson County Ass'n.

INDIVIDUALITY is the FEATURE of the SALE—but *Production* and *show ring records* will not be lacking. For instance, a bull that won FIRST at Wisconsin, Illinois and the National Dairy Show will be sold. A heifer that was Junior Champion at the Illinois State Fair in 1918. Two daughters of King Pieter 19th. A daughter of Walcowis Canary Pietje. A son of King Korndyke Sadie Vale. Three daughters of King Segis Pontiac. Two daughters of Canary Fobes Bessie Homestead. A bull that stood second in New York State Fair, in a ring of 56, and was First at the National Dairy Show, 1917. A daughter of Paul Calamo Korndyke, the only bull that took Grand Champion at the National Dairy Show three times, and also sixteen Grand Championships in one year. This heifer is also out of Haeger's great old show cow, Prilly Clothilde De Kol, that stood so often second to the unbeaten Champion, Minerva Beets, and she was Junior Champion at Illinois and is bred to a 37-lb. son of King Segis Pontiac. A two-year heifer out of a 23-lb. dam and granddaughter of a 36-lb. cow. A 19-lb. cow. A 26-lb. three-year-old. A cow with a two-year-old record of 26.87 lbs., which is the second highest in the state.

Note—This is absolutely the time to lay in some foundation breeding stock. There are not enough hand picked ones to go around and they are undoubtedly going higher. And the fellow who takes his nerve right with him and picks off all these selected cattle he can afford now, will be "sitting pretty" when you hear from him a few years from now. It takes some time to build a herd—but a good one is wonderfully well worth all the time and pains it takes to get it.—R. N. Thompson.

Everything Guaranteed and Subject To Re-Test

Sale under the Management of the

Illinois Holstein-Friesian Association

R. N. Thompson, Field Sec'y, 130 North Wells St., Chicago

Catalogues will be ready for mailing about November 15th

Complete Dispersion Sale

of D. V. Whiteleather Herd

50 Registered Holsteins

at Columbia City, Indiana

Tuesday, December 7th

Consisting of

1 5-year-old herd sire	1 6-year-old cow
1 11-year-old cow	5 5-year-old cows
1 10-year-old cow	2 4-year-old cows
2 9-year-old cows	8 3-year-old cows
7 7-year-old cows	7 2-year-old cows

12 heifers born in 1919, some bred and some not bred.

3 heifers born in 1920.

4 males from 6 weeks to 4 months of age.

Reference Sire No. 1 is a grandson of Aaggie Cornucopia Pauline, a daughter of De Kol 2d's Paul De Kol, and the first cow to go above 34 lbs. as a senior 4-year-old. She has two 30-lb. daughters and one of these has two 30-lb. daughters. His dam is a 22.39-lb. daughter of Rag Apple Korndyke (therefore a sister to Rag Apple Korndyke 8th) out of a 27.73-lb. sister of King Segis. One-half the families in this sale are daughters of Reference Sire No. 1 and those that are bred are bred to a son of King Segis Pontiac, out of a 26.61-lb. daughter of Paul Calamo, a grandson of Pontiac Korndyke.

For further information write for a catalog now ready and mailed on application.

Purebred Holstein Cows Return $1.54 for One dollar of Feed

Even though you may regard your farm as a diversion or your hobby, you would doubtless prefer to see it self-supporting, and perhaps take still greater pride in it for that very reason. Here are two or three facts! Holsteins are the largest, most vigorous, most even tempered, the easiest-cared-for breed, and the greatest yielders of milk in the world. Their milk is the most evenly balanced in fat, sugar and proteids, and for that reason easily digested. It is everywhere recognized by the medical profession as absolutely the best for infant and invalid feeding as well as for general use. A herd of Holsteins will give you on the average $1.54 for every dollar's worth of food they eat. Send for our free literature and look it over. Perhaps you will be interested in buying Holsteins.

The Holstein-Friesian Association
101 Hudson Street, Brattleboro, Vermont.

Your Choice of **50** Young Bulls

They Are Out of Yearly Record Dams And Sired By—

—King of the Ormsbys His dam, his dam's dam, and his full sister all have semi-official records above 1,000 lbs. His own dam has four records above 30 lbs. in 7 days and three above 1,000 lbs. in 365 days.

—King of the Sadie Vales His dam is a 38-lb. cow and both of his grandams are 41-lb. cows. His three, four, six, nine, and twelve nearest dams average over 31 lbs. in 7 days.

—Johanna King Segis His sire is a yearly record son of King Segis, and his dam is a 40-lb. cow — the first cow to produce over 500 lbs. butter in 120 days.

—Sir Inka Prilly Segis He is a 30-lb. son of King Segis. He has 20 daughters with semi-official records, and 15 are now on test.

If a saving of from $100 to $500 on a bull means anything to you, then write for our new price list which shows pedigrees of the bulls we have for sale.

Why Buy a Son of King Pietertje Ormsby Piebe?

Because he is one of the very best long distance bred sires in the country.
Because he not only is backed by show ring individuality but is himself siring show ring winners.
Because he will be given every chance as a sire and his daughters will all be given the best possible chance.
Because his sons are always in demand. If you have one he will actually increase in cash value during the next several years.
We have several good youngsters for sale by him from good 7-day and year-record dams.

is this bull we offer, and individually as good as his sire, Sir Walker Segis Homestead, first prize yearling bull at Chicago and Waterloo, 1919.

His dam just finished 305-day test with over 12,000 lbs. milk and 500 lbs. butter (2 milkings daily) as junior two-year-old and is a show heifer, first prize two-year-old and champion female at Minnesota's largest county fair and Holstein show (175 head).

Send for pedigree and photo.

A. J. Lashbrook, Northfield, Minn.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

6 Good Cows For Sale

THE MINNESOTA KIND

They are all by a 36-lb. sire, are bred to a son of King Korndyke Colantha Ormsby, and are due to freshen this fall and winter. They are from 3 to 5 years old and absolutely straight and right. Lack of barn room forces us to sell. Write or come and see them.

E. J. Brosious, - Stillwater, Minn.

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters. one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.

His dam has a record of 23.778 lbs. and now on yearly test.

Geo. H. Elwell, - Minneapolis, Minn

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams. For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

Grandsons of S. P. O. M. 41st and a Few Good Cows For Sale

The cows either have A. R. O. records or are from tested dams, and are in calf to my herd sire, a son of S. P. O. M. 41st. The young bulls are from A. R. O. dams.

Herd under state and federal supervision. Write for complete information to

V. R. HOLMES, - ANOKA, MINN

Grandsons of

Duchess Skylark Ormsby and of S. P. O. M. 38th.

for sale. These youngsters are from A. R. O. dams that are now making good yearly records. Write today for further information.

POPLAR HOLLOW STOCK FARM,
Bertram D. Scott, Prop., Hotel Hastings
Minneapolis, Minn.

Pine Row Holsteins

Bull calves from A. R. O. dams, sire a 31.42-lb. grandson of Sir Pietertje Ormsby Mercedes.

E. A. HEIFORT, - STILLWATER, MINN.

COME TO BISCAY

for your next purchase of pure-bred or grade Holstein cattle, mature or young stock. Large selection, also a few select male calves to offer. Located near station.

BISCAY SALES CO., BISCAY, MINN.

Mankato Holstein Farms

Our Herd Bulls

King Colantha Ormsby Bess, A Sir Pietertje-Bess Burke combination. Nine dams average over 1,000 lbs.

A son of Ormsby Korndyke Lad. Ten daughters over 1,000 lbs. butter, eleven over 22,000 lbs. of milk.

A son of Sir Pietertje Ormsby Mercedes 14th, that great transmitting show sire.

Both Males and Females For Sale

Marlow & Randall, Mankato, Minn.

(A Federal Accredited Herd)

BULLS—Two of Them.

Ready for service. One light and one medium in color. One sired by our DUTCHLAND CREAMELLE COLANTHA LAD, from a good daughter of SIR WINANA BEETS SEGIS. The other sired by SIR WINANA BEETS SEGIS from a daughter of SEGIS JOHANNA GRAHAMHOLM. Both cows are on yearly test now and are making good records. Don't buy a bull until you have seen and studied the pedigrees, pictures and prices on these youngsters. They are good ones. GRAHAMHOLM FARMS,

H. R. Searles, Mgr. Rochester, Minn.

For Sale

A Few Good Females

Several High Class Young Bulls

I have a few good ones left. Write me at once if you are in the market for a herd sire or a few foundation females.

CHAS. OBY, Maple Lake, Minn.

For Sale

Minnesota bred Ormsbys; Fresh Cows, Heifers and Young Bulls, by two of the best bred, year record Sires in Service. From A. R. O. dams.

M. L. Enright, East Grand Forks, Minn.

If You Went in to a Grocery Store

and laid the price of a dried up loaf of bread on the counter you would expect to get a dried up loaf of bread. Yet, a fellow came here the other day and laid down the price of a dried up bull. We haven't any dried up bulls for sale so he went home without one. If you want a good bull calf, any age, better write for the circular today.

Flecks Farms, Faribault, Minn.

The Farmer's Yearly Balance Sheet

National Interest demands that it show profits

IN 1830 ten hours of labor produced three bushels of grain. Today the same labor produces 60 bushels. The modern farmer more successfully combats insect blights, live stock diseases, soil conditions and in many cases even the elements.

This advance has been made at tremendous cost through research by the Department of Agriculture, Universities and other agencies supported by public funds because successful agriculture is vital to National prosperity. Only success can keep the best manhood on the farms.

In spite of improved methods, however, many farmers make only a "living" from their work. *In many cases criminal waste is the cause.* This waste is glaring in the case of farm machinery. Millions of dollars are lost yearly by farmers because machinery is not protected from the elements, and more important still, because it is inefficiently operated.

Prominent engineers agree that over 50% of all engine troubles on tractors, trucks and automobiles are due to incorrect lubrication. Incorrect lubrication not only means repair expense, but excessive oil and fuel consumption, frequent shutdowns and quick depreciation.

The Vacuum Oil Company has for years been recognized the world over as an authority on scientific lubrication. Gargoyle Mobiloils when used as specified in our Chart of Recommendation, have in hundreds of public and private tests shown a saving of oil from 50 to 70% and a fuel economy from 17 to 25%. Besides lower operating costs Gargoyle Mobiloils enable you to get engine results, which means more power, less trouble, less depreciation.

Farmers fully alive to this situation have increased their profits to an appreciable extent by the economies effected with scientific lubrication.

The Chart of Recommendations (shown in part on this page) specify exactly what grade of Gargoyle Mobiloils will give you best engine results from your auto, truck and tractor.

* * *

Gargoyle Mobiloils are put up in 1- and 5-gallon sealed cans, in 15-, 30- and 55-gallon steel drums, and in wood half-barrels and barrels.

Write for "Correct Lubrication," a booklet containing complete automobile and tractor charts and other valuable data.

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container.

VACUUM OIL COMPANY, New York, U. S. A.

Specialists in the manufacture of high-grade lubricants for every class of machinery. Obtainable everywhere in the world.

New York	Philadelphia	Detroit	Minneapolis	Kansas City, Kan.
Boston	Pittsburgh	Chicago	Indianapolis	Des Moines

Chart of Recommendations *for* TRACTORS

(Abbreviated Edition)

How to Read the Chart

THE correct grades of Gargoyle Mobiloils for tractor engine lubrication are specified in the Chart below.

A means Gargoyle Mobiloil "A"
B means Gargoyle Mobiloil "B"
BB means Gargoyle Mobiloil "BB"
Arc means Gargoyle Mobiloil Arctic

These recommendations cover all models of tractors unless otherwise specified.

Where different grades of Gargoyle Mobiloils are recommended for summer and winter use, the winter recommendations should be followed during the entire period when freezing temperatures may be experienced.

This Chart is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and constitutes a scientific guide to Correct Tractor Lubrication.

If your tractor is not listed in this partial chart, consult the Chart of Recommendations at your dealer's, or send for booklet, "Correct Lubrication for Tractors," which lists the Correct Grades for *all* Tractors.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LX | FORT ATKINSON, WIS., DECEMBER 3, 1920. | Number 20

ADVOCATING THE AD

HELEN S. K. WILLCOX, NEW YORK

"THEY'RE at it again," mournfully observed a friend of our American bossy the other day. "In all the principal and most popular magazines, men's or women's, the folks behind the cottonseed or cocoanut cow are right on the job as usual boosting oleo to the skies. For instance, in nearly every Saturday Evening Post one or more of the Big Five, the packers, come out with a double page spread about good old oleo."

"But the milk people probably are running similar ads telling about their products, aren't they?" mildly inquired an innocent bystander.

"They probably are —not!" retorted bossy's friend wrathfully, "unless you except the occasional one put out by the condensed milk people such as Carnation and Bordens. No, no. The American dairyman and his representatives all agree that advertising on a stupendous national scale would do wonders toward rightening present chaotic dairying conditions, securing the good will of almost every man and woman in the country who can read, and educating the public as to the honest qualifications of milk and its by-products for a sounder place in the American scheme of things; but so far, we have done a lot of shouting and mighty little constructive effort toward a panacea which we all more or less believe in. Strange, isn't it?"

"Well, I've always thought that a year in and year out advertising campaign would do a good deal for the milk industry," the innocent bystander remarked thoughtfully, "but I supposed the milk folks had arrived at the same conclusion long ago and by this time they would be in a position to talk back from the opposite page to those brassy oleo fellows."

"Not so you could notice it," returned the B. F. wearily, "even though 85,000 of them are organized in New York and surrounding states and are proposing to take their business into their own hands and run it to suit themselves instead of the dealers. And just think of the tiny deduction which would do the trick if taken from the combined dividends of those 85,000 for one year! Not to speak of all the other farmers in the United States who could be levied on, or asked to contribute voluntarily. Why, the advertising appropriation of the imitation butter makers would look like two cents beside that of the milk makers, if someone would only start the contribution ball rolling, and think of the results in multiplied dollars and cents which would roll back to the farms as sure as this country is almost dry."

"Yes, and they've got some live subjects to work on," said the I. B. speculatively. "Now there's a lot of romance and interest and life in a glass of milk or a pound of real butter or a piece of real cheese or even in a saucer of ice cream. You could get under the hide of a business man any day by cleverly picturing the goodness and tastiness and wholesomeness of his noon-day lunch when made up of a crusty roll spread with sweet country butter, a schooner of milk fresh from the clover fields, or a square of rich, tangy cheese to accompany a good old fashioned spicy apple pie."

"Sure, and it makes me homesick just to think of such appetizing stunts," confessed the B. F. reminiscently. "Such advertising would take the poor tired business man back to the old farm at the first crack out of the box. He would remember how ma used to set the milk every night in the long pantry and how she would skim the thick goodness off every few days, and how she would let him work the dasher to the old churn and what excitement there would be when the butter got ready to come. And he'd remember how delicious that sweet home-made butter used to taste on great fat slices of ma's bread hot from the oven, with maybe a little maple syrup spread on for fair measure. And the tall schooner of milk would take our great industrial leaders back in memory to the old barn away up state where they milked old Brindle by lantern light and fed her and watered her and brushed her and petted her—and left her at the first opportunity for fairer and more profitable fields. Why, those fellows would read a subtle advertisement written around the old farm and the milk therefrom, and they would order a lunch of it from that time forth, for the sake of the old folks and the farm and bygone days if nothing more. Isn't that the truth?"

"I'll say it is," answered the I. B. enthusiastically, "and believe me, I'd like to write those ads! Before I'd get through, I'd have every town and city Jack and Jill tumbling over themselves to double their usual milk allowance and wondering how on earth they had let the substitutes put it over on them so long. Why, the facts and figures that milk and butter and cheese alone could muster would prove the complete undoing of competing also-rans, and with the old farm as a background to furnish the charm and romance, we'd all see our dairy troubles disappear as the morning dew and the old cow would just naturally have to hump to keep up with the demand."

"Oh, yes, all that would happen without a doubt if our advertising had the punch and flavor and appeal," the B. F. replied, "but like all the rest, we're doing a lot of talking and that's all. But this I do know, if I were some of the big organizations taking care of the farmer and dairyman today, I wouldn't let another night go by without taking off my coat and going after permission to start this long-talked of advertising crusade. Some of the producers have tried it with most conspicuous success, such as the Sunkist people, and the walnut people, the peanut people, and the raisin people, and the apple people from Washington and Oregon, but the farm won't have been fittingly represented and made to take its proper place in the sun until the milk and butter and cheese folks have their advertising innings and then keep everlastingly at it. Now why don't we advertise instead of taking it out in advocating?"

"Well, don't pick on me as if I were to blame," said the I. B. as he moved officeward, "but gosh! if they ever begin to advertise the products of the old farm so that you can fairly taste 'em, if they tell by word and picture of the clover fields and contented cows, my digestion can go blooey! I never could resist good butter and rich cheese and fresh milk. No, sir! I never could resist 'em in a regular colored-up American ad!"

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

This Ration Makes Winter Eggs

The following ration for winter egg production recommended by the University of Missouri College of Agriculture satisfies the needs of the hens and is economical and practical for most sections of Missouri. During the past year it has been fed on a number of Missouri farms with good results.

Scratch Grain: 10 pounds shelled corn and 5 pounds dry threshed oats. Dry Mash: 3 pounds wheat bran, 3 pounds wheat shorts, and 1½ pounds commercial meat scrap.

Where milk is plentful three gallons of skimmed milk or buttermilk furnished each one hundred hens daily will take the place of meat scrap. Either milk or some form of lean meat must be supplied in every ration for successful winter egg production. Commercial meat scrap can be obtained from most feed dealers in one hundred-pound sacks. One sack will supply protein needed by one hundred hens for more than two months. Kaffir or feterita may be substituted for the corn. Barley or feed wheat may be used instead of oats. Corn meal or ground oats may be substituted for shorts in the mash. Alfalfa meal or clover leaves may take the place of the bran. A good grade of tankage may be used instead of the meat scrap. In feeding this ration all grain should be fed in deep straw to compel the birds to exercise. The mash should be fed in self-feeding hoppers or troughs and a supply kept before the birds. In addition to this ration, hens should have an abundance of water, a supply of green food, and free access to sharp grit and crushed oyster shells, or soft limestone grit. With early hatched pullets, housed comfortably, and fed this ration, winter eggs are assured.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

That Comfy Feeling

The holidays lie just ahead,
With promise of a Christmas tree,
And dreams come to a restful bed,
Of gifts the Yule will bring to me.
It is a time of gladsome cheer,
Of smiles, contentment, and repose.
My crops all in—the hour so near
When every Christmas candle glows.

A while, at least, my chores are light,
No worry, 'til the dawn of spring.
And prospects seem sublimely bright
For May and all the birds that sing.
The herd is better than of yore,
Each cow a ribbon-winning belle,
How could a fellow ask for more?
I think I'm doing mighty well.

And so, each evening, by the fire,
The cattle snug, the barn as prim
As any parlor, my desire
Is linked with prayer-thoughts and a hymn.
I'm thankful for this span of rest,
When, in my slippers, I can sit
And rock and figure how I'm blessed
By luck and sort o' hugged by it.

⚜

James J. Jeffries, former world's champion heavyweight, seems to have made a success of farming since his retirement from the prize ring. He has a fine herd and many of the cows have won prizes for him at the Los Angeles Stock Show. And Jim feels so happy over it that he has gone and had his photograph taken with King Segis Pontiac Jannek, a super-prize winning Holstein. Well, we somehow feel that Jim will get more out of the dairy business than the prize ring, in the long run.

⚜

The Old Dairyman's Philosophy

The cow that habitually holds back her milk is some kin to the employee who loafs when the boss is not looking.

There are a lot of clubs a boy might join but believe me none of them can equal the calf club.

It's a long lane that has no turning but trust a cow to find the turn, no matter how far it is.

⚜

The Way Not to Succeed

Fight good roads movements.

Refuse to admit that pedigreed stock is best.

Look on cream separators as "fake machines".

Get along without silos of the modern kind.

Discourage living near transportation facilities.

Knock the idea of motor trucks on dairy farms.

Be unprogressive in dairy barn appliances.

Laugh at the very idea of mechanical milkers.

Never give the boys cows of their own.

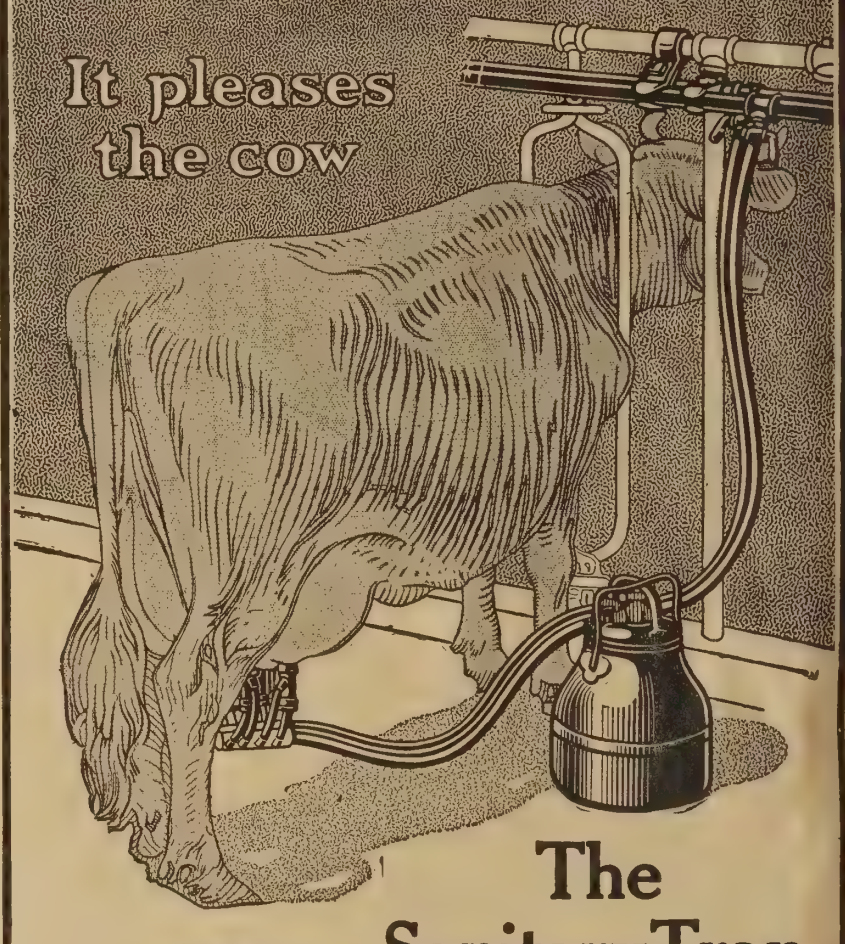
Tell mother she doesn't need a dish washing machine.

Or a clothes washer or electric lights.

Be brutal, unkind to your stock.

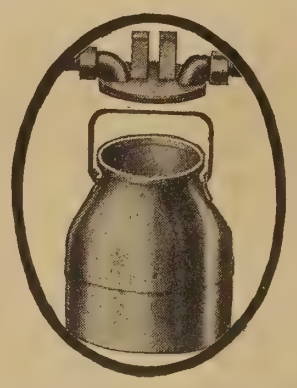
⚜

"I'm getting along famously with my new hired hand."



"How do you work it?"

"Oh, he only works when he feels like it and then on part time."



⚜

"Mother and the children are making out their Christmas lists already," remarked Dairyman Joe Perkis, "and while I haven't seen 'em yet, I'll bet a calf to a new cream separator that I'm down for the sort of woolen socks that make my feet feel as if I was walkin' in briars."

The De Laval Milker

The Sanitary Trap

(The Sanitary Trap is not shown in the part of the Milker installation pictured above. It is placed between the Pulso-Pump and the first line of stanchions)

The Sanitary Trap is one of the important features of the De Laval Milker. It is placed on the vacuum pipe-line, and catches any moisture which may be drawn into the vacuum line or form there by condensation. It also collects particles of scale or other foreign matter that may get into the system.

It can be conveniently and quickly removed, and may then be washed out as easily as an ordinary milk pail; and also permits cleansing the entire system.

The high efficiency of the Pulso-Pump (the rotary vacuum producing power unit of the De Laval Milker) makes the use of the old-fashioned bulky and unsanitary vacuum tank unnecessary.

The De Laval Milker is distinctly different, possessing many new and exclusive features that are of inestimable value to the careful dairyman and owner of valuable cows. Its action is positive and uniform from day to day, and it is faster, more reliable and more sanitary than any other method of milking.

Wherever cows are milked the world over, the name "De Laval" stands for quality and highest value to the user. The fact that it bears the name "De Laval" is a guarantee that it will give the service claimed for it.

Write to nearest De Laval Office for Milker Catalog, mentioning number of cows milked

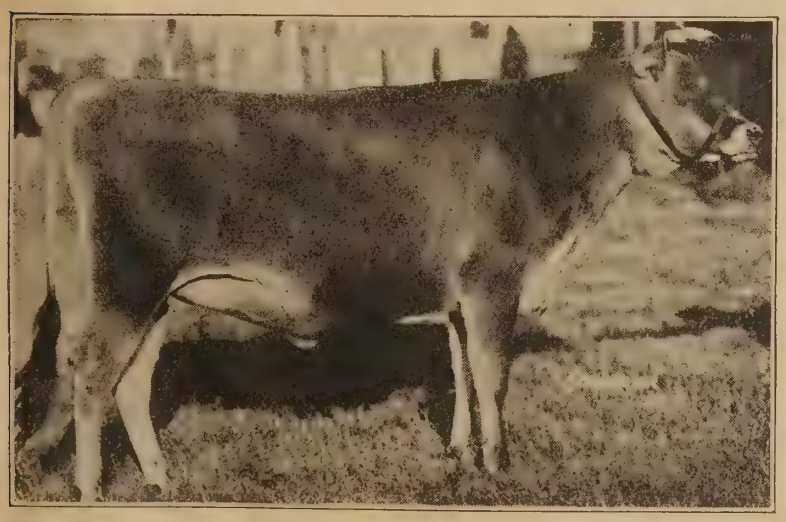
Season's Greatest Jersey Show

Photographs from Shreveport where highly successful exhibition was made and 60 animals averaged $707 at auction



Imp. Fern's Oxford Triumph, grand champion female and the sensation of the show. $15,000 two-year-old owned by Ayer & McKinney, New York.

Buttercup's Butter Lad, highest priced bull, consigned by Longview Farm, Missouri, and bought by R. J. Fleming, Ontario, for $3,200.

Boosters for the show: W. R. Hirsch, Secretary Louisiana State Fair; herdsmen and caretakers; C. H. Staples, promoter of the show.

Raleigh's Miriam, Longview's senior calf, second in class at Shreveport and sold to C. M. Gouch, Tennessee, for $1,500.

You'll Do's Fairy, highest priced female. Consigned by Thomasville Live Stock Company, Georgia, and bought by R. J. Fleming for $4,000.

Aged cow class in ring. At right is Grove Bell Queen, winner, owned by Ed. C. Lasater, Texas.

Breeders and dairy farmers in front of coliseum where show and sale were held.

California Co-operatives and the Mid-west

Report of Representatives of Mid-west Farm Bureau Federations Who Visited Pacific Coast Co-operative Marketing Associations

THE matters which this committee observed and which seem to offer helpful suggestions in connection with the mid-west farmers' plans for co-operative marketing of grain and live stock may be grouped under four heads:

1. Relation of growers and marketing agency.
2. Legal structure of marketing agency.
3. Commercial practices.
4. Economic and social outlook and purpose of the co-operative organizations.

Relation of Growers and Marketing Agency

In the first place, your committee was deeply impressed with the fact that successful western co-operatives have passed beyond the stage of local shipping-point co-operation to that centralized organization which is necessary if significant results are to be obtained in the market distribution of the crop. The individual growers no longer seek to retain personal control over the disposal of their crop, through the local co-operative association, if they see fit or through other channels if these seem to offer more at the moment. Instead, they delegate their power to a large-scale marketing company which, either through a centralized or a federated plan of organization, brings to a focus the administration of supplies sufficient in volume to give it an effective influence in the market centers and hence upon the price-making process. The first step toward the stabilization of market conditions is the organization of producers (the supply side of the market) into units commensurate in size and trading efficiency with the buying agencies (demand side of the market) with whom they must ultimately deal.

This is simply to say that, for the specialized and delicate process of market distribution, they regard their industry rather than the individual producer as the unit, and as many as possible of those who grow a given commodity organize to have this work performed jointly for the best interests of all the members. Ten thousand five hundred citrus growers over all the important producing territory in California turn their fruit into one great marketing organization. Nearly as many prune and apricot growers, scattered over a stretch of several hundred miles, organize the selling of their commodity on a similar basis.

The western people invariably counseled us that it was useless to launch such a co-operative agency unless a majority of producers turn their products over to it for distribution and unless the members of the organization are tied to it by contractual obligation covering a period long enough at least to get the new sales system established in the markets, say five years. Even after it is so established they regard it as necessary to sign up the growers annually for the whole of each year's business.

The other side of this exclusive relationship of the producer to the co-operative selling concern is that the sales agency handles only the product of its members. It is not a commercial company trading with the general public for the profit of its members as are many of our farmers' elevators. Rather is it a mutual association for service to its members on a cost basis. In the judgment of your committee this exclusive membership relation of the Pacific Coast co-operatives represents the true type of co-operative organization and should be followed by mid-west organizations.

While an effective degree of centralization is necessary for the control of actual operations, this can be kept on a democratic footing through a federated scheme of organization and the vesting of control in the hands of directors elected by the member bodies. The voting trust type of organization seems to the committee inappropriate to a co-operative organization.

California co-operative associations fall into two classes, those in which growers hold membership directly in the central association and those in which individuals join in a local association, and those district exchanges join in a central exchange to give service to the whole industry. In view of the existing development of our local farmers' elevators and state farmer grain dealers' associations, it seems that the federated plan based on these already established organizations would be the one best suited to our needs.

Legal Structure

The two-fold plan of a non-stock distributing company and a stock corporation for warehousing and the handling of supplies seems excellently suited to the needs of the grain business. Its service-ability in facilitating the financing of a stored product through the use of warehouse receipts is clear. However, its value as a means of securing immunity from legal control is at least doubtful. In a decision just handed down by an Oregon court the position is pretty clearly taken that even a non-profit co-operative association is as subject as any other to prosecution for acts which tend to create a monopoly or to restrain trade.

This same issue comes up in connection with the contracts which seek to tie the grower to his marketing association for a period of from one to seven years. Such contracts can be made effective only through the use of fines, penalites, liquidated damages, provision which will be upheld by the courts, or through suits in equity to restrain others from alienating members or to enforce specific performance by such members. It is true that liquidated damage clauses have been successfully employed by the California Fruit Growers' Exchange and several other California associations. But while these contracts have been upheld in the lower court, no such case has as yet been adjudicated by the Supreme Court and the California people themselves are somewhat dubious as to what the outcome would be. In view of the decision of the Iowa Supreme Court in the Deborah case (160 Iowa p. 194) that provision could not be enforced in the state of Iowa, and it seems quite likely that at least some of the neighboring states would take the same stand. As for specific performance, Judge Morrison of Los Angeles, counsel for several co-operative associations, informed members of the committee that he saw little hope of securing relief of that sort from the courts in his own state, which is probably the most favorable place for such an experiment. As for injunctions or restraining orders, the action of the Oregon court and the attitude of courts elsewhere in labor union cases and those involving the holding of the food supply seem to negative any expectation that the courts would use this means of enforcing growers' contracts.

It may be added that the attitude of the California people on this point is the outgrowth of conditions somewhat dissimilar to those maintaining in the mid-west states and this committee would suggest that possibly the existing development of farmers' elevators and the sense of loyalty engendered by such agencies as the Farmers' Union, the Equity Society, The Grange, and the Farm Bureau Federation may be sufficient to guarantee the flow of an adequate supply of grain through the channels of the co-operative selling agencies, enabling them to accomplish all the proper objects of such associations, though not assuring them a monopoly position in the trade.

Commercial Practice

In their commercial practice, the Pacific Coast co-operatives follow two general lines: first, the distribution of their supplies to the country's markets as equally as possible, there to be sold at prevailing supply-and-demand prices; and, second, the naming of a price at which contracts will be executed and which aims to establish a periodic normal level, in some cases extending over a period as long as a whole season. It is the conclusion of your committee that the former method, which has been so successfully followed by the California Fruit Growers' Exchange, is the one which would be applicable to the marketing of grain at least during the early stages of operation by any centralized distributing concern which may be set up. This method is also used by the poultry producers in California and seems to us best suited to a commodity which in the nature of the case has a continuing rather than a seasonal market flow.

Even in the case of those associations which name an opening price, the door is left open for the revising of the price in case subsequent market conditions make it necessary or advisable. The practice of the California Almond Growers' Exchange is particularly significant in that Mr. T. C. Tucker, the general manager, insists that after the initial price has been named by the directors, power shall be left in his hands to modify this price when in his discretion such action is advisable.

A second striking feature in the commercial management of the western co-operative organizations is that they use existing trade agencies to a very large extent. Their point of view seems to be that such agencies are in the main efficient and that what is required is merely to bring them into such working relations with the producer that he may secure the benefit of their efficiency. The poultry producers in Los Angeles, in San Francisco, and in Portland have secured a membership on the regular exchange of these cities and practically all of the associations sell their product through the regular brokers in eastern markets. The chief concern seems to have been to eliminate the shipping point speculator and to retain such control of distribution as to prevent undesirable speculation in their commodities by central market wholesalers. It is true that some of the associations look forward to the time when, perhaps through the alliance of several commodity organizations, they can retain brokers in all the principal eastern markets who will be the agents exclusively of California co-operative associations. The citrus association already has its own salaried salesman in all the large markets.

It may be added in this connection that these associations have secured efficient business management by employing the best trained and most successful men of practical achievement wherever they could be found inside or outside their own membership. They have not been afraid to select men who had previously been private dealers, packers, or local shippers of their commodity. They have thus secured the best marketing brains and put them to work for the producers' interest. To do this they have not hesitated to pay good salaries, and

AYRSHIRES FROM THE MASONIC HOMES FARM, PENNSYLVANIA, WHERE A HIGH PRODUCING HERD HAS BEEN DEVELOPED

From left to right the illustrations show the milking herd with the modern barn in the background; Finlayston Bell's Mamie, ex-champion roll of honor three-year-old with a production of 11,298 lbs. milk, 424.75 lbs. fat; Finlayston Bell's Daisy, senior four-year-old roll of honor champion with a record of 11,549 lbs. milk, 490.75 lbs. fat; and Pamelia Ayer of Sunnyside 2nd, with a senior three-year-old roll of honor production of 10,672 lbs. milk, 380.11 lbs. fat.

WHO WON THE ST. LOUIS MILK STRIKE

Settlement Made on Basis of Monthly Values on Corn and Butter

WHAT will happen to the price of corn during 1921; are butter quotations going up during the coming year or will they slump? The answer determines who won the St. Louis milk strike. November 1 the Southern Illinois Milk Producers' Association began shipping milk to St. Louis on a year's contract in which the price is based on corn and butter values. From September 17 to November 1, the period of the strike, its members, almost to a man, loyally abided by the association's decision and held all milk from city shipment. Who won the strike—producers or distributors—is still disputed; each claims victory though each suffered heavy losses. The answer will be made by the trend of corn and butter markets.

The basis for agreement which started milk flowing cityward from the eleven counties in southern Illinois that supply St. Louis milk is a new one. Whether it is a good one for the producer remains to be seen. At least it made the November price slightly exceed that at Chicago. Moreover, it has the virtue of being the only basis successful as a means of settlement.

Basis for Monthly Price

The agreement holds until November 1, 1921, when it may be renewed for a year. The price is calculated each month by multiplying the per cent of butterfat by the average daily value of 92 score butter on the Chicago market for the previous month, plus one-half the average daily price of a bushel of cash corn on the St. Louis market as an allowance for skimmilk, plus thirty cents per hundred pounds for hauling and handling. An additional thirty cents per hundred pounds will be paid in November, December, January, and February, an additional twenty cents in August, while a deduction of thirty cents per hundred pounds is made in May and June. An illustration of the operation of this agreement is had in the calculation which established the November price at $3.10. The average Chicago price for 92 score butter in October was $.57, and that for corn in St. Louis, $1.01. Therefore:

Butterfat	.57x3.5	$1.995
Skimmilk		.505
Hauling and handling		.30
Addition for November		.30
November, 1920, price		$3.10

This price is paid within the zone in which the freight rate on a ten-gallon can of milk does not exceed twenty-nine cents, the producer paying transportation charges in excess. All milk is to be taken, the deductions in price taking care of the surplus. November milk retailed in St. Louis for 16 cents per quart.

Association's Beginning in 1912

The life of the Southern Illinois Milk Producers' Association has been a troubled one. It had its beginning in 1912 around Edwardsville where producers organized to fight indictments brought by federal authorities charging adulteration of milk. The producers won every case. When they invited the distributors to meet with their association in discussing milk prices, they were told, "Go home and milk your cows. We'll tend to this end." Five years ago the organization had grown to 800 members. When the price offered in 1916 was $1.29, they demanded $1.40 and held their milk on the farm for nineteen days. Again in September 1917, a near-strike was compromised under governmental pressure. Since that time the distributor has recognized the strength of the association and the right it claimed of having something to do with setting the price of its members product. Before that time the producer never knew the price of his milk until his check came. Now the association membership in its 111 locals exceeds 7,000, seventeen hundred having joined since the beginning of the strike. It furnishes 90 per cent of the milk consumed in St. Louis which totals around 100,000 gallons per day.

The Strike Ended November 1

The price paid in August and until September 15 was $3.75. The producers asked for a continuation of that price, 31 locals threatening to hold their milk if the association did not secure that or more. Negotiations with the five dealers who handle about five-sixths of the city's milk brought an offer of $3.50. The producers came down to $3.65 and finally to $3.60; the dealers only raised their bid to $3.55, leaving a difference of a nickel. Neither side would give in, so a strike was called for five cents, milk being held first September 17th.

ONE OF HERMAN SCHULTZ'S PURE-BRED HOLSTEINS WHICH HAS PRODUCED AS MUCH AS 93 LBS. OF MILK IN A DAY

Such cows return a profit at prices which will fail to give a living from a herd of average production.

Producers stuck loyally to their association. As late as October 20 only four out of 104 locals reported members shipping. Milk was skimmed and the cream sent to the creameries or other markets were found. But conditions did not favor a strike; it was ill-advised and unwise. From the beginning there was never a chance that the producers would get their price. The leaders claim to have known that, saying they only abided by the majority vote to build the association together. They say the producers had grown so used to success through their organization (which for the first seven months of 1920, for example, secured prices $.15 above those at Chicago) that they were unreasonable, that they only wanted to follow a "get more" policy. Many producers assert that the officers mistakenly led the association into a hopeless strike. These same men now hold that in the agreement which is made the producer has been "sold out", that the butterfat allowance is too low, the price for handling inadequate, and the valuation on skimmilk too small.

Wherever the fault lies in calling a strike when all commodity prices were on the decline and condenseries were frantically seeking a market for large quantities of milk, it soon became apparent that the producer could not control the supply. The Helvetia milk Canning Co. bought milk at Highland for $3.25 and shipped it to St. Louis dealers. Thereupon, on September 23, the producers cut down the daily shipments to the Helvetia plants at Highland and Greenville from 750 to 800 eight- to ten-gallon cans to 140 cans. Then milk began to flow in from northern Illinois, Wisconsin, Michigan, Indiana, and Ohio at prices as low as $2.25 plus transportation though some milk cost distributors more than the price offered the local producers. The supply was unlimited and the quality satisfied the health authorities of St. Louis. The distributors were therefore able to hold out indefinitely, while the growing impatience of members continually weakened the association's position. The fight was lost.

No Advertising Done

At no time has the association presented its cause to the consumers of its product. There is money in the treasury but the officers do not believe in advertising. They refuse to pay for publicity in daily papers which have published statements unfavorable to the producer. Throughout the period of the strike, and previously, public opinion has been molded entirely by the statements of the distributors. The public has had no opportunity to know the producer's side of the story—and the information given out has builded prejudice against him.

In the settlement made after the producers' milk had been kept out of St. Louis for about forty-five days, a year's contract was made. It is held that this is to the producers' advantage, that he has never before been able to know prices that far ahead. Though some members prefer not to decide on this point until the year's corn and butter prices are known, the price seems to be the best which could

PRACTICAL DAIRY FARM EQUIPMENT IN ST. LOUIS MILK DISTRICT

Even in the partial corn failure because of chinch bugs enough of a crop is secured for silage. Note the numerous windows giving abundant lighting. At the left is a load of cowpea hay, an excellent feed to combine with silage.

RECEIVING STATION AT SHIPMAN, ILLINOIS

This station was closed for 35 days during the St. Louis milk strike. The average daily shipment from this station was quickly reduced from 55 ten-gallon cans to two, indicating the producers' loyalty to their association.

Uncle Sam's Hired Men Who Serve You

This is the ninth of a series of articles this publication is running, in co-operation with the U. S. Department of Agriculture, to acquaint our readers with the type of men who are making possible the wonderful service the department is rendering and stands ready to render our readers, that those not now availing themselves of these services may do so.—EDITOR.

The Man to Whom Soil is a Living Thing—Milton Whitney, Chief of Bureau of Soils

W. J. MADDOX

SOME years ago a group of highly respected men in the United State predicted dire things concerning the soil of this country—that before long it would lose its power to produce crops and that the then fertile fields would be barren wastes. It was a very alarming and gloomy picture and caused quite a deal of discussion. The prophets called upon a certain scientist of the United States Department of Agriculture, an expert on soils, to write a paper for them on the subject, expecting, of course, that he would back up their theory.

This man was Milton Whitney, now chief of the Bureau of Soils. Now Mr. Whitney had some ideas of his own on the matter. He prepared the paper, but he took issue with the gentlemen in question, and pronounced a theory directly opposite to theirs. His doctrine was summed up thus:

Can Not Be Used Up

"The soil is the one indestructible, immutable asset that the nation possesses. It is the one resource that can not be exhausted; that can not be used up. It may be impaired by abuse, but never destroyed.

"This does not mean," says Mr. Whitney, "that there have not been individual failures through poor management of the soil by individuals or communities. There are many failures in all industrial and commercial life, and the farmer is not exempt from similar limitation of capacity necessary for success.

"Researches of the bureau have shown that the soil is a living thing, in exactly the same way that an animal or a plant is a living thing—it breathes; it has a circulatory system; it has a solution carrying food material similar to the blood of animals; it is the home of the same kind of bacteria, chemical substances, and processes as play a part in the animal growth and maintenance; it digests organic matter disposing of the remains of animals and plants through much the same process and with the formation of similar organic products as animals."

The soil, he has found, is subject to fatigue, and in extreme cases to suspension of all useful activities, according to the treatment it receives and the conditions under which it exists. The soil, therefore, must be properly exercised by plowing and cultivation; it must be properly fed by plants, the remains of which it can digest, and by a rotation of plants, just as the dairyman finds it necessary to vary the feed of his cows to keep them in a high state of production.

A Physician to the Soil

Whitney, therefore, stands in the place of a physician to the soil. As a physician advises a change of occupation or a change of diet for certain human ailments and uses drugs to aid in his treatment, so Whitney diagnoses the disorders of soils and recommends a change of method, or a change of cropping system and the intelligent use of commercial fertilizers for restoring the soil to a healthy condition of production.

To make this service of nation-wide scope and bring it directly to every farmer in the United States is Mr. Whitney's problem. Under his direction his field specialists are conducting one of the largest pieces of work of the kind ever undertaken in any country. This is the soil survey which when completed will give a detailed account of the physical and chemical make-up of every square mile of soil in the United States. The information thus obtained is of value in many ways, particularly to the farmer. It forms a basis for determining how to treat the soil and cultivate it to the best purpose.

As to others to whom the information is of great value: The prospective farm purchaser is enabled to find the proper soil for his purposes and has expert judgment as to the nature of the soil in any one locality and the farming it is best suited for. The survey furnishes the basis for the experimental field work of the state experiment stations and also gives the stations the necessary knowledge for advising farmers in different parts of their states as to cropping systems and cultural methods. The railways use the soil maps in their development work. Road engineers and sanitary engineers use them. Forestry men use them as a basis of sales of land after the timber has been cut. They are important to the Reclamation Service for its development work, particularly for providing efficient drainage, and for the prevention of the rise of alkali where the possibility of such a danger is shown.

Mr. Whitney has often been asked to place a monetary value upon the soil survey.

"It is impossible," he declares, "to place a money value on information of this kind, but if I had a farm of 100 acres I should be willing to pay a man who has the experience in soils, such as our soil survey men have, $100 to visit my farm to tell me what the soils are, what they correspond to in other localities, and what the general experience of farmers and scientific men have developed as to the best cropping system, the best treatment, and the best line of development of the soils on my particular farm. It is easily worth a dollar an acre."

That is, if all the farmers in the United States believed in the value of soil surveys as Milton Whitney believes in them—and he ought to know—we would have, at a dollar an acre, a nice little value of $640,000,000 on the surveys of the 1,000,000 square miles already studied.

Of course, no charge is made by the bureau for its advice to farmers or anyone else to whom its knowledge or information may be of use. On the other hand, it is anxious to be of as wide service as possible. The 1,000,000 square miles already surveyed represent approximately one-third of the United States.

Probably the most notable other achievement of Mr. Whitney's bureau is its work against alkali. The occurrence of alkali in soils under arid conditions has caused enormous losses in the past. England has been studying the question in India for sixty years, and together with France has been pondering the same problem in the north of Africa since their occupation of that territory. The Bureau of Soils was the first to make a thorough, comprehensive study of the situation as regards the origin and character of the trouble.

As a result, its experts invented a small portable electrical testing apparatus which records through a telephone receiver the percentage of alkali at the surface or at any given depth in the soils. The methods devised by them for the detection of hidden alkali deposits and for the prevention of the rise and injury to crops from alkali through irrigation and drainage have been adopted by all the countries of the world confronted with such problems.

Through the soil survey the bureau examines and maps, in all arid regions, the amount of alkali for depths of six feet throughout the area under survey. The practical elimination of these alkali salts through drainage has been established, so that the alkali problem has ceased to have the dread that it formerly had and there is no longer a possibility of the rise of these salts from unknown and hidden deposits after irrigation begins.

The bureau has 82 men engaged in its field work, and 91 stationed at the main office at Washington, D. C.

A Profession and a Hobby

Since his appointment as chief of the bureau, Mr. Whitney has been closely associated with all its achievements. The study of soils is not only a profession with him but a hobby. At his home in Washington he has a private laboratory where he delights to spend his odd moments conducting experiments.

Whitney is a native of Maryland, having been born in Baltimore, August 2, 1860. He was appointed assistant chemist at the Connecticut Agricultural Experiment Station in 1883; and served as superintendent of the Experiment Farm, North Carolina Experiment Station, from 1886 to 1888. In 1891 he was appointed soil physicist of the Maryland Experiment Station, where he remained until selected to head the Bureau of Soils in 1894.

The Bureau of Soils, it should be remembered, is only one of the seventeen bureaus that go to make up the United States Department of Agriculture, all working together, each using information furnished by the others in planning and suggesting better methods in agriculture for the benefit of the farmers and also for the benefit of every other citizen of the U. S.

MILTON WHITNEY

Growin' Up For You

IT'S true we farmers have to work, from sun-up to sun-down, and still have lots of chores to do, when stores are shut in town; and it's a fact we have to dress in jeans of brown or blue, and wear big boots and old slouch hats that seem quite rude to you. But, city friend, it's helpful work and mighty healthful, too, while chores for livin', breathin' beasts are just a joy to do. And when we quit and go to bed, we sleep, for cares are few, while night winds call from crops and stock: "We're growin' up for you!"

Yes, crops and stock are growin' fast, while we're at work or sleep, just growin' into money that, will us in old age keep; for tho' we toil all day for them, they work all night for us, and that's a thing store stock don't do, so we are favored thus. The store man's pay is insecure, he waits and hopes for luck, while all the time his overhead threatens to get him stuck; he's glad if he makes both ends meet, with worry, work, and fuss, but on the farm our pay is sure—it's "growin' up for us!"

No doubt the city has its charms, with lots of shows to see, and ev'rybody's slick dressed up, compared with folks like we; but farm life's happy, just the same, we love all Nature's scenes, the glittering lights of the "White Way", beside the stars seem tame. We watch the movies of the skies and wondrous pictures see; the season's ever changing sights are ours without a fee. And then there is the farm's best crop, of children strong and fair, that in the city 'partment house, ain't welcome anywhere; they are life's sweetest joy to us, tow-heads and red-heads, too; thank God for them, America, they're growin' up for you!—DR. A. S. ALEXANDER.

M. A. C. Ayrshire Makes Record

Spot Fox, an eight-year-old Ayrshire owned by the Massachusetts Agricultural College, has recently completed a very creditable record of 17,749 lbs. milk, 634.39 lbs. fat. She began her test on September 26, 1919, at the age of seven years and eighteen days. She was bred by the Massachusetts Agricultural College and is owned and was tested by them. She is sired by Victor Cairn and out of May Fox. She already had to her credit a junior three-year-old record of 12,313 lbs. milk, 426.47 lbs. fat.

Vermont. J. G. WATSON.

Behind the Scenes at the National Dairy Show

O. R. ZOLL, ILLINOIS

THE great amphitheatre at 42nd and Halsted street was filled with thousands of spectators night after night who watched the artistic and spectacular feats of horsemanship, on the occasion of the dairy and horse show. During the day other thousands threaded the long aisles between the exhibits and marveled at the progress that has been made within a decade in the discovery of new milk products and the development of machinery to handle them. At all times people could be found admiring the beautiful herds of the five principal breeds of dairy stock that occupied the whole of the second floor.

All these folks thought little of what was happening "behind the scenes." The beautiful horses and ponies, when out of the arena, were the especial care of the jockeys and stable boys. On coming from the arena wet with sweat, each horse was received by stable boys who, armed with cloths, proceeded to rub him dry, after which he was carefully blanketed and then placed in his stall. At stated times each horse must be gone over with the clippers from fetlock to ear tips. He must be fed a balanced ration, must be washed, brushed, rubbed, and 'dolled up.' To keep one exhibit of thirteen horses in trim, seven men were required.

In the dairy barns, all exhibition stock was given similar care. They had their barbers and manicuring staff. The horns must be scraped and polished, and in some instances covered with leather covers; the hoofs must be cleaned and polished and a regular program of washing, brushing, and rubbing down, and daily exercise, must be carried out. Symptoms of disease must be noted and the animals taken to the hospital in an adjacent building.

Back of all this work lies the preparation of the stock on the home farm and the transportation to Chicago, under the immediate care of the foreman and his help.

To the writer who, for several days stood at the south entrance that led to the stables and who saw much of the 'behind the scenes,' all this was most interesting.

While the thought of the populace was on blooded horses and prize cattle there was another sort of animal that infested the show, that gave grave concern to the door keepers, policemen, and others responsible for seeing that all who entered paid the regular admission. I refer to the children that live in the vicinity of the stock yards. One could but note the striking contrast between the care bestowed upon the horses and cattle and that bestowed, or rather not bestowed, on these urchins of the street.

Here they came by couples, half dozens, and at times scores, with every conceivable sort of container for milk which was given away by the men at milking time. Some fairly well dressed, some poorly clothed; some fairly clean and others positively filthy; but all with a persistence that would not take "no" for an answer.

"Please, mister, can I go in for some milk?" was the pressing inquiry.

"No," replied the doorkeeper.

"Oh, please, let me in. Just turn your head and let me slip by. Won't you please?" came back in pleading tones. And if he turned his head even for the fraction of a second he could be sure that one or more had slipped by.

Should he out of sympathy for these children, hungry for the sweet rich milk, continue the dialogue, the crowd would grow and the pleading be pressed until in self defense he would be compelled to assume an angry attitude and yell: "Get out of here! Clear out before I break your heads," and swing a club viciously as if he intended to carry out the threat.

Perhaps at this moment a policeman appears down the alley; someone gives the signal, "There's the cop!" and immediately a dash is made pell-mell for Halsted street. The cop disappears and like flies they return, one, two, three at a time, from whence no one can tell, and before ten minutes has elapsed, the whole bunch is back again.

But the more resourceful youngsters do not waste time with the gatemen. Some new knot hole can be found—that is certain, so with eagle eyes they scan every square inch of the great building. Perhaps here is a high gate across an entrance with just enough room to squeeze in over the top, or perhaps from the window above the gate a friendly herdsman may reach down and pull the youngster up and into the goal of his ambition, the cow stables. Here is a twelve-foot gate with threatening barbed wire stretched across the top, but there is a space of three or four inches at the top between the gate and the post. To scale the gate and squeeze through this space is the work of a minute. Once in, the climbing of a 4 x 4 to the wash shed where the cows are given their shower baths, and then through a window, and our young knight has gained entrance to the fortress.

While one urchin eludes the guards in this way, another has found an open sky light and dropped down upon a friendly bunch of hay. More than one youngster—girls as well as boys—were hustled out of the doors by some imperious and officious guard, only to be back in, smiling and happy with a "hello, mister," a wave of the hand, and a dash away to safety.

How beautiful the show must have looked to these youthful eyes, and how delicious the milk must have tasted after such strenuous effort to gain entrance!

But—seven men to care for thirteen horses!—How many people were caring for these hundred children?

One man to every two horses which he clips, brushes, rubs, waters, feeds, and exercises with greatest concern, and which he watches over for any symptoms of disease. But these children—many of them with hair that apparently had never been thoroughly combed; clothes saturated with dirt; hands, face, and feet—perhaps the whole body—strangers to the bath—who looks after these children?

Dairying Thirty Years Ago

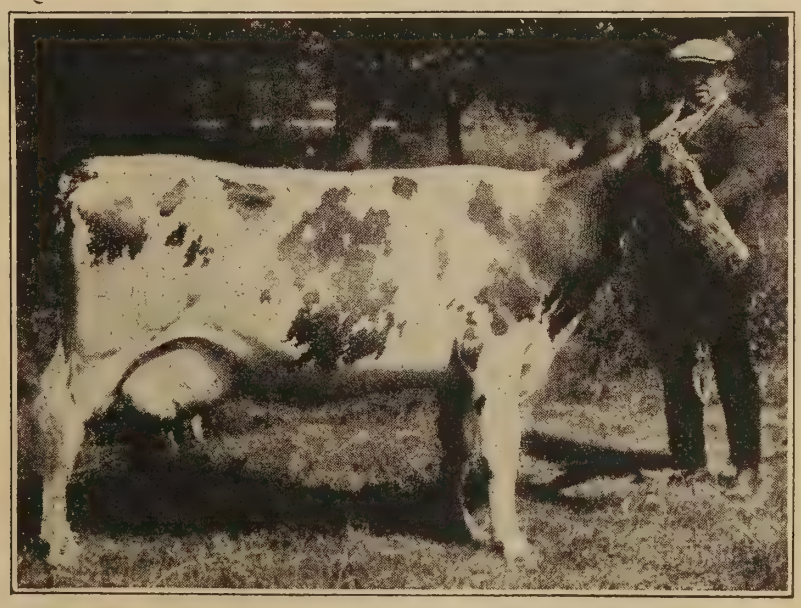
Taken from the Issue of Hoard's Dairyman of November 28, 1890

When the cow is annoyed, or is uncomfortable, she is not earning profit money for her owner.

⚜

Same old stupidity manifests itself in Scotland that existed against the use of fanning mills. Some of the pious Scots who had "winnowed" their grain when the wind blew thought it was a sin to get up a gale with a fanning mill when the Lord willed there should be a calm. So now the inventor of the milking machine met the scorn and hatred of the milk maids who had been pulling cows' teats all their lives and were fearful their occupation would be gone if the cows were milked by machinery.

There are lots of fellows wearing pants who, in their secret souls, are just like those Scottish dairy maids—oppose any improvement that either nearly or remotely threatens to supersede any machine or interest that gives them bread and butter. They thus advertise their incapacity to earn a living in an improved world, but want to sweat one out of the ignorance of other folks.



A Mammoth Cheese

At the cheese factory in East Otto the other day there was put into the hoop the biggest cheese ever made in this region and probably in the United States. It measured five feet in diameter and is 39 inches high. Its weight when cured will be 4,000 pounds and fully 38,000 pounds of milk were used in its manufacture. The abundant pasturage made the September milk unusually rich and this huge cheese is expected to be of prime quality. About four weeks will be required to cure it thoroughly. This record-breaker was made for a grocery house in Cincinnati which is about to occupy a large, new building. It is wanted as an attraction for the opening.—Buffalo Commercial.

⚜

Mr. O. N. Dennison, Mason City, says that the requisites required to get good milk for the manufacture of creamery butter were honesty, cleanliness, and confidence. There must be honest dealing with the cows, honest dealing with the patron, honest dealing with the manufacturer. There must be cleanliness in the barn, with the milk utensils and in the factory. There must be mutual confidence between the producer of the milk, the maker of the butter, and the proprietor of the factory.

If any of these points are lacking in any particular there is lack and a loss in the best results that may be obtained from the dairy.

NANCY WHITEHALL

NANCY WHITEHALL, a seven-year-old Ayrshire cow, owned by Middlesex Meadows Farms, Massachusetts, is the latest addition to the 20,000-lb. class of the Ayrshire breed, having completed a 365-day mature record of 22,075 lbs. milk, 858.77 lbs. fat. This record places her in sixth place among the mature animals of the breed both in milk and butterfat. This completed record is remarkable on account of the fact that last year this cow completed a junior four-year-old record of 18,797 lbs. milk, 754.27 lbs. fat, test 4.01%, this record making her junior four-year-old champion in milk production.

Nancy Whitehall was bred by J. A. Dalton, Wisconsin. She was dropped October 28, 1913. She was purchased at the first Brattleboro Ayrshire Sale from Newton Farms, Massachusetts, for $925, and since that time has been at Middlesex Meadows Farm, South Lincoln. Her two completed records average 20,436 lbs. milk, 806.52 lbs. fat.

⚜

The great want of today is men. Men who can't be bought and sold. Men with votes too honest to sell them. Men in office, too honest to buy them. Men who think twice before they speak, thrice before they act, and four times before they vote. Men quick to see and prompt to act. Men who will stand for right, firm as a rock, though powers and parties crumble, and all around seems chaos and confusion. Men prompt to condemn wrong, whether found in high places or low.

Men who can look the world and the devil in the face and tell the truth. Men too large for sectarian bonds. Men who know their message and can tell it and stop it when done. Men who mind their own business. Men who know how to work and are willing to eat what they earn and wear what they have paid for. Men too brave and true to betray a trust for self-interest.—Pennsylvania Farmer.

Those farmers who may have immature corn in their cribs can prevent molding by salting. Use one pound of salt to three bushels by weight of ear corn.

"SNAG-PROOF"
Rubber Footwear

Here's One Way to Make Your Money Go a Long Way

WEAR Snag-Proof Arctics over your leather shoes. You know how quickly snow and slush ruin leather shoes. And you know what leather costs. Snag-Proof Arctics are economical. They keep your feet warm, dry and comfortable. You can slip them on or take them off in a jiffy. You'll get seasons of satisfying service out of every pair.

There is a Snag-Proof rubber boot, shoe or arctic for every purpose. The Snag-Proof dealer will be glad to talk it over with you and help you decide just what kind of rubber footwear it will pay you to buy. All dealers do not sell Snag-Proof goods. We pick the dealers who are more interested in permanent satisfied customers than in quick profits. It will pay you to find the Snag-Proof dealer in your town. Once you learn what extraordinary value you always get out of a product with the green Snag-Proof label, you never will buy any other.

California Co-operatives and the Mid-west

(Continued from page 872.)

feel that those payments have been amply justified by results.

It is also noteworthy that they have established adequate banking connections for the financing of their marketing operations. This is due to the fact that they could come to the banker presenting a thoroughly organized marketing system in the hands of trained and experienced men and with a substantial volume of the crop definitely placed in the associations control by means of growers' contracts. This is a point which will be of the utmost importance in the development of any grain marketing project by mid-west farmers. The experience of the Pacific Coast seems to make it clear that whenever it appears that the large volume of product is going to move through co-operative channels, that suitable arrangements will be made for financing this co-operative agency.

The third phase of the commercial practice of Pacific Coast co-operative organizations is their universal practice of pooling returns. This is a practice which is of the essence of the co-operative method. If any group of co-operating producers are ready to merge their marketing operations for the sake of securing a better average result for all, pooling is the logical method of procedure. It is by no means clear to your committee, however, that the grain and live stock farmers of this section are at the present time ready to renounce their individual control over the marketing process to this extent. In case such a feature were to be incorporated into any plans advocated by the committee of 17, it is clear that a thorough program of education would have to be undertaken before it could be put into actual operation. The introduction of state wool pools during the last two years has doubtless paved the way to some extent for such a move.

Economic and Social Outlook and Purpose of the Co-operative Organizations

The last and perhaps most important observation of this committee concerns itself with the general goal and attitude of co-operative organizations. Our western friends seem to have these aims in view (a) The improvement of handling processes and the reduction of loss and waste between the grower and the wholesale market. (b) The development of their market outlet through aggressive salesmanship, advertising, etc. (c) The stabilization of prices through better distribution both in time and place, the development of export markets, by-product uses, etc.

It appears to your committee that, in view of the character of our commodity, the Pacific Coast example under heading (b) above yields only negligible promise of benefit to our people. Substantial results could undoubtedly be secured under heading (a) by a central marketing organization strong enough to exact proper railway, storage, and financial services and prompt and adequate settlement of damage claims, and to secure a high level of business efficiency in both the physical handling processes and the business practices of each unit in the system from the local elevator forward.

Probably, however, the greatest interest of our people centers in what prospect there may be for effecting selling prices favorably or of assuring profitable net returns to the producer and whether California experience leads us to believe that such results might be secured through large scale co-operative organization.

It is the conclusion of your committee that the favorable results secured by Pacific Coast co-operative associations are the results of a combination of better merchandising methods and of the price levels brought about by general war and post-war conditions. Except in the case of the California Fruit Growers' Exchange and the Associated Raisin Company, their operations have been limited to the high price and "sellers market" period of the last four or five years. The leaders of the movement admit that, in common with all other business interests, they have difficulties ahead during the impending period of downward price revision. They recognize that the prices of the last years have stimulated production of land enormously and have tended to advance the capitalization of land as well as other forms of fixed capital. We believe heartily that in such periods of economic difficulty that a strong association of producers is even more imperative than in periods of high prices, when even individual methods will produce remunerative returns. However, this co-operative organization should seek merely to enhance the

BABCOCK CELEBRATION

forcible at law, will give the association greater economies in marketing processes, and to protect its interests against artificial depression or discriminating practices. Any attempt to create and use a monopoly power for securing a specially favorable economic position for its members is as pernicious in a farmers' organization as in the case of the so-called trusts, to whose monopolistic activities we have so properly objected in the past.

Frankly, we feel that some of the western co-operatives occupy a position on this point which is economically sound and socially right. Others we think do not, and the state court in Oregon and the federal government in California have already taken steps to modify their procedure.

Summary

The conclusions of your committee can be briefly summarized as follows:

(a) No very strong, permanent, or extensive co-operative marketing organization is likely to be built up unless economic necessity forces a great number of the farmers into it. Present conditions and future prospects of grain prices would seem to indicate that grain growers may be ready for such a collective movement.

(b) Likewise no considerable result would be achieved unless producers of a given commodity over some area large enough to make a suitable economic unit consolidate their common interests in the most efficient distribution of the product of their industry.

(c) If the association is to have the proper basis for financing itself and organizing its distributive operations, its members must enter into a regular contract to deliver their product to it over a reasonable period of time. Such contracts, even if not fully enforceable at law, will give the association somewhat greater security than it would otherwise enjoy and will be morally binding or enforced by local public sentiment in a majority of cases. How far the courts will go in support of them will doubtless depend largely on the policies and practices which the association sought to carry out through the powers conferred by this contract.

(d) As soon as growers pass from the point of view of the individual to that of the industry, settlement on a pooling basis becomes necessary as a means of averaging the results of the joint action of all producers and of distributing the benefits of the organization equally to all its members.

(e) Lastly, your committee reports that the co-operative associations do not "fix prices". They simply are efficient agencies to get the best prices that the consuming market affords. The fact that several of the co-operative associations on the Pacific Coast are at the present time constrained to accept prices below their calculated costs of production indicates that they have not secured through their organization any immunity from fundamental economic laws. On the other hand, we are convinced that such associations are a powerful agency in securing for their members more favorable prices than they could otherwise obtain, and that our farmers need equally good selling service in the difficult times by which we are confronted.

Fort Scott Dairy Show

HOARD'S DAIRYMAN.—The progress and interest in dairying in Southeastern Kansas was most graphically and convincingly exhibited at a local Dairy Show held at Fort Scott, Kansas, during the last week of October. Five years ago there were but few dairy cattle in this section, while today there are thousands of heads of Holsteins and Jerseys. These animals are of quality that would bring credit to a much older community.

At the show this year sixty-nine head of Holsteins and twenty-one head of Jerseys were housed in a large tent, while a second tent 50x120 feet contained a judging ring, platform, and twenty-three booths containing exhibits of milking machines, stanchions, electric lighting plants, dairy feeds, and farm and home machinery.

A feature of the demonstrations was one in which two cows from a local cow testing association were compared, both cows were from the same herd and had the same opportunity. One returned an income above the cost of feed of nearly $200 for the year, while the other returned only $80. Only through the association would it have been possible to have appreciated the great difference in the productive ability of the two cows.

In addition to band music, motion pictures, demonstrations, and lectures, entertainment was provided by a calf race in which a pure-bred Holstein calf was given to the boy who caught and held it, and also by a ladies' milking contest in which nine ladies competed to see who could first milk a quart bottle full.

Prizes were offered for the cows exhibit at the show which produced the greatest amount of butterfat in forty-eight hours. These prizes were awarded as follows:—First, Oklahoma Queen (Holstein) produced 4.3 pounds of fat and 104 pounds of milk; second, Manmouth (Holstein) produced 4.0 pounds of fat and 97 pounds of milk; third, Colorado Sue (Holstein) produced 3.5 pounds of fat and 96 pounds of milk; fourth, Stella (Holstein) produced 3.3 pounds of fat and 102 pounds of milk.

Kansas. A. C. MALONEY.

Association Notes

Hillsborough County, New Hampshire:—Cows did very well during the month of October. The drop in feed prices is reflected in the increased profits over feed in all herds. Some members started feeding silage with noticeable results in milk flow. Milk testing 3.7% sold for $4 per cwt. and 4c per point above. It retailed for 15c per quart and butter for 75c per pound. The local prices on feeds are: Bran, $59 per ton; corn, $50; hominy, $60; middlings, $70; mixed feed, $80; cottonseed meal, $67.50; gluten, $60; oil meal, $70.

Barnesville, Ohio:—In October market milk testing 3.5% sold for $3.50 to $4 and 5c per point above this test. Feeds are rated as follows: Oats, $2.20 per cwt.; hominy, $2.75; gluten, $2.80; bran, $2.25; oil meal, $3.50; cottonseed meal $3.75; beet pulp, $3.10; corn, $2.25.

Oldham County, Kentucky:—Two unprofitable cows were sold during the month of October. A great deal of interest is being taken in semi-official and official testing in this county and some very creditable records have been made. A Holstein cow in September made the second highest seven-day butter record in the state. Market milk sold for $3.49 per cwt., 5c being paid for each point above 4.2%. The creamery paid 53c to 60c per lb. for fat. Milk retails for 16c per quart and butter for 60c to 65c per lb. Feed prices are: Bran, $44—$60 per ton; ground barley, $58; cottonseed meal, $65—$70; hominy, $60; oats, 60c per bushel.

Bourbon County Co-operative, Kansas:—During October the condensery paid 72½c per lb. for fat and the creamery paid 55c per lb. Milk retails for 15c per quart, butter for 54c per lb., and cheese for 35c per lb. Cottonseed meal is rated at $3 per cwt.; bran, $2; oats, 45c per bushel; and corn, 50c per bushel.

Clatsop County, Oregon:—One separator was leveled in September and saved three pounds butterfat in two milkings. Dairymen of this section received $2.90 per cwt. for milk testing 3.8% and 5c per point above. Sweet cream sold for 73c and sour cream for 68c.

Rogue River, Oregon:—Dairymen here received $3.60 per cwt. for milk and 14c per quart for city trade. They received 70—74c for sweet cream and 64c for sour cream. Local feed prices are: Rolled oats, $62 per ton; coco meal, $64; barley, $59; millrun, $65; soy bean, $88; alfalfa hay, $20—$25.

North Branch, Pennsylvania:—A pure-bred Holstein bull was purchased during October to head a herd formerly headed by a grade bull. Five cows were sold, one of them as a "boarder". Three 2-year-old cows made around 13 pounds butter in a week under official test. Three per cent market milk sold for $3.85 per cwt. and 4c per point above this test. Milk retails for 12—15c per quart, butter for 60—75c per lb., and cheese for 34c per lb. Feed prices are as follows: Mixed hay, $25 per ton; corn silage, $8; wheat bran, $55; cottonseed meal (36%), $70; corn and cob meal, $45.

Whitewater, Wisconsin:—October milk testing 3.5% sold for $2.63 per cwt. and 7c per point above. The condensery paid 75c per lb. for fat and the creamery paid 73c per lb. Milk retails for 14c per quart, butter for 68c per lb., and cheese for 29c per lb. Local prices for feeds are: Oats, $40 per ton; corn, $25; oil meal, $65; alfalfa, $32.50; silage, $6.

Kent County Co-operative, Michigan:—Due to the fine fall weather, pasture is still good in some localities. Whole milk retails for 15c per quart. October prices for butterfat ranged from 60c to 65c. Feed prices are: Corn silage, $8 per ton; clover hay, $18; alfalfa, $30; timothy, $26; mangels, $5; ground oats, $40; Unicorn, $70; bran, $38; linseed meal, $70; cottonseed meal, $65; corn meal, $60; barley, $50; gluten feed, $56.

Merrimac Valley and Strafford Carroll, New Hampshire:—In this combined association, one farmers' exchange is very active in buying grain and another does a monthly business for a few members. A number of unprofitable cows are weeded out each month with resulting higher average production per cow. Some members are improving their feeding, with increased profit. October market milk sold at an average price of $4.60 per cwt. The creamery paid 76c per lb. for fat. Milk retails for 15—18c per quart. Hay is rated at $25 per ton; silage, $10; bran, $60; cottonseed meal, $68; oil meal, $70; ground oats, $66; gluten, $68; hominy, $60; N. H. Dairy, $68.

Augusta County, Virginia:—Market milk sold for $4.25 per cwt. in September and butterfat for 70—72c per lb. Milk retails for 15c per quart

and butter for 65c per lb. Prices paid for feeds are: Alfalfa hay, $30 per ton; clover hay, $30; mixed hay, $25; corn silage, $8; "Ready-mixed" grains, $80; cottonseed meal, $75.

Loudoun Valley, Virginia:—Prices received for the month of September are: Market milk, 32—33c per gallon; cream, 20% at $1.75 per gallon; butterfat, 88—93c per lb. Feed prices are as follows: Corn silage, $10 per ton; "Ready-mixed" grains, $75—$80; wheat bran, $60; corn meal, $75; cottonseed meal, $85; beet pulp, $60.

Rockingham County, Virginia:—September market milk sold for $2.80 per cwt. and butterfat for 70c per lb. Milk retails for 12c per quart and butter for 48c per lb. Alfalfa hay is rated at $28 per ton; clover hay, $25; mixed hay, $25; corn silage, $8; "Ready-mixed" grains, $82; wheat bran, $68; middlings, $70; corn meal, $90; cottonseed meal, $80. Two unprofitable cows were sold.

Southwest Virginia:—October market milk sold for 30c per gallon and butterfat for 90c per lb. Retail milk is sold for 14c per quart and butter for 75c per lb. Feed prices are: Corn silage, $8 per ton; "Ready-mixed" grains, $70; wheat bran, $60; middlings, $80; cottonseed meal, $73. Five unprofitable cows were sold.

Canaan, Connecticut:—One pure-bred bull was placed during the month of October. Three per cent market milk sold for $3.65 per cwt. and 4c per point above. Feed prices are: Hay, $30 per ton; silage, $8; bran, $50; oil meal, $62; cottonseed meal, $67.50; gluten feed, $63; ground oats, $54.

Cow Testing Associations Help Nova Scotia Farmers

Cow testing associations in Nova Scotia are proving quite popular and useful in the dairying sections of the province as a means of bringing the farmers together and distributing information which would tend to improve their conditions and help to increase the production of their herds.

During the past two or three years one feature of the work has been to foster and help organize breeding associations. Because of the small number of cows in the average herd of Nova Scotia, it was practically impossible for each farmer to own a pure-bred bull. But through the breeding associations, a great many farmers are now able to have the use of a pure-bred sire which has been especially selected because of the milk producing quantities of its ancestry. The cow testing associations and breeding associations are working together to increase milk production by means of better breeding.

This spring, by means of a monthly letter sent to the different testers in Nova Scotia, the dairy promoter, Mr. H. R. Brown, put on a campaign to have the farmers of the associations sow a mixture of oats, peas, and vetches as a silage crop or for green food during the latter part of the summer. Arrangements were made whereby the farmers could procure good seed through the cow testing associations and altogether something over 100 acres were sown. The crop has proved to be such a benefit that the men who sowed this last spring are already planning to sow a much larger acreage next year.

Thus by fostering better breeding and better feeding, the cow testing associations are materially helping to increase the production of the dairy cow in Nova Scotia. These are only two ways in which the farmers are being helped, but they show the possibilities of what might be accomplished by a cow testing association in any dairy community.—Canada Department of Agriculture.

Co-operation and Justice

HOARD'S DAIRYMAN:—We read with interest such articles on co-operation as that in Hoard's Dairyman for October 1, 1920, on "Almond Growers". Some of the underlying principles of healthy co-operation are rapidly becoming a part of the thought of all. As with all movements of this character where a great power is acquired there is grave danger of carrying principles of honest economics to the extreme. There is one very serious condition exhibited in the operations of almond growers and one, which, if allowed to extend itself to other co-operatives, may completely destroy them.

Someone is quoted in the above-mentioned article as follows: "By organizing the almond growers have been enabled to fix a price for their product which yields a fair return on their land and labor and pays a reasonable profit besides. That is the reason why there has been such a tremendous increase in the acreage devoted to almonds." This is probably fair and right from every economic standpoint, so long as the supply of almonds does not greatly exceed the demand.

But, in the same article, Mr. T. C. Tucker, who is indicated to be the general manager of the Almond Growers' Exchange, is quoted as follows: "We pay no attention to the cost of production. We set a price that we think will move the crop."

Earlier in the same article appears this statement: "Note that statement in the preceding paragraph—fixes the price. That does not refer to the steel trust, nor is it a mistake in print." The author evidently feels that the methods followed approximate those of the steel trust and is proud of it.

It appears that the almond growers have waxed exceeding rich because it is pointed out that the acreage has increased about sevenfold in ten years. Who pays?

Suppose the situation represented by the almond growers was duplicated by the wheat growers. Every farmer would produce wheat and more wheat and yet more wheat and in a little while the consumer would be getting very cheap bread.

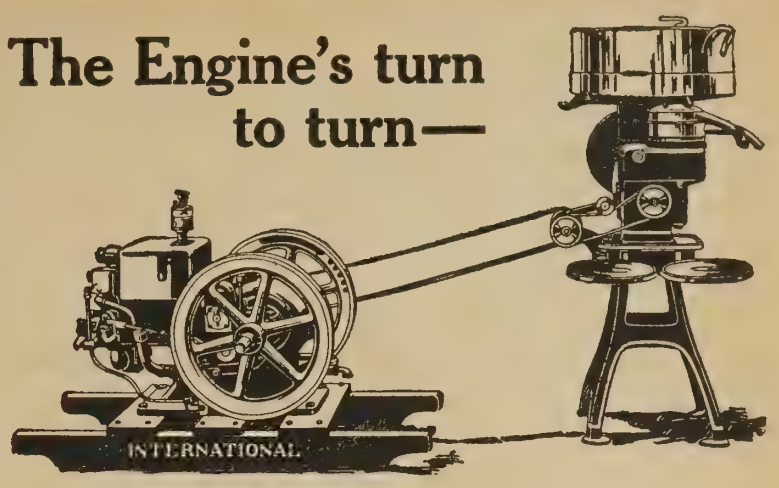
Who should benefit by co-operation? Only those who co-operate?

There is a beginning and an end to every commodity. There are those who create the supply and there are those who create the demand. Without either of these there had as well be no commodity.

The producer is entitled to cost plus a reasonable profit. Those who exact more because they can charge "all the traffic will bear" without respect to cost are as much "profiteers" as any who have been convicted.

Justice is about as large an element as any in the world.

We believe one of the principles of co-operation is justice.

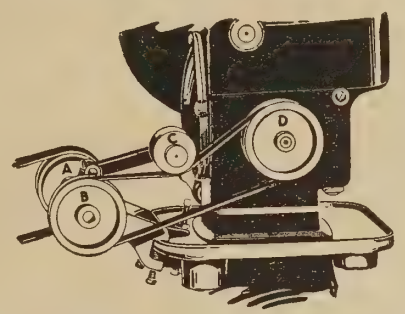


Selling, from an economic standpoint as well as that of fairness, must start from the basis of cost of production. After that supply and demand will determine the profit. If the demand is established, control production and none need worry about profit if fairness is there.

REX E. WILLARD.
North Dakota College of Agriculture.

Jersey Cattle Notes

For the week ending November 12: Number of animals registered: bulls, 213; cows, 563; total, 776. Number of transfers recorded: Bulls, 223; cows, 822; total 1,045.



The Engine's turn to turn—

Every dairy farmer who handles a large volume of milk knows that turning the easiest running cream separator in the world by hand gets to be monotonous work before the day's run is finished.

The **Primrose Direct Power Drive** has simplified greatly the matter of separation on a considerable scale. This practical little addition to Primrose efficiency can be attached to any hand-operated **Primrose Cream Separator** and does not interfere in any way with hand turning of the separator when occasion demands the latter method.

By means of this simple attachment, direct connection can be secured to an engine without speed-reducing gear, to a line shaft or portable electric motor.

If your milk volume has reached such proportions as to make separating a real task, then it is most certainly the engine's turn to turn. A **1½ h. p. International Kerosene Engine** and **direct-power-drive Primrose** will shoulder the job willingly and handle it efficiently.

A, belt pulley on counter-shaft. **B**, flanged pulley on counter-shaft. **C**, belt tightener. **D**, clutch pulley on extended pinion shaft.

92 Branch Houses in the United States

Don't Freeze Burn Wood

You must burn coal or wood. Coal is scarce and high priced. Wood is plentiful and cheap. Get a WITTE Drag Saw. Cut your wood for almost nothing. You can get delivery if you buy now and the lowest price.

Now $125 F.O.B., K.C. From Pittsburgh Add $6.80

The WITTE Arm Swing Saw

is **Lever Controlled.** You **Push** to Start—**Pull** to stop. Any speed you want in starting or stopping. A fast cutting outfit with high power 4-cycle engine. Cuts much faster than former rigs. Cash or Easy Payments. Sold on lifetime guarantee.

WITTE TREE SAW EQUIPMENT
Latest Out—Most Practical—Costs Less

Makes the Log Saw a Tree Saw. Quick change. **$34.95** Extra. Cuts trees clear down. Only one rig to handle. Branch Buzz Saw for sawing top wood, only **$23.50.** Why Pay more? Write for Log and Tree Saw Catalog FREE.

WITTE ENGINE WORKS
1648 **Oakland Ave., Kansas City, Mo.**
1648 **Empire Bldg., Pittsburgh, Pa.**

NULIFE
Pure Sugar Cane Stock Feeding
MOLASSES

Makes more milk. Puts more fat on steers, horses, sheep, and hogs in less time. Feed **NULIFE** pure sugar cane molasses with all your roughage and grain.

If your dealer can't supply you, send us his name and **Order Direct,** 55 gallon barrels — 25 cents per gallon — $13.75 per barrel **F. O. B. Chicago.** Pamphlet on **Feeding Facts Free. Prompt shipment. Order Today.**

OELERICH & BERRY COMPANY
864 Larrabee St., Dept. A., Chicago, Ill.

DALY FOOD STOCK FEED $11.00 FOR 50 GALS **MOLASSES**
Best and Greatest Stock Feed ever discovered. Equal to corn and cheaper. Barrels weigh 625 pounds, over 50 gallons. Big feeders using 60-barrel car lots cheaper. Can be mixed with roughage to replace grains. Will ship sight draft to bill of lading payable on arrival at your station. Sample and book free.
THE J. J. CARVEY COMPANY, DEPT H, NEW ORLEANS, LA.

Learn to be an Auctioneer

Taught by the practical method. By our plan you study at home and receive a part of the commission while learning. Enroll now and be ready for the fall business. Write for our free catalog. Address
Kissling's Auction School of America, Indianapolis, Ind.. Dept. F, William C. Kissling, President.

NOW
is the time to purchase a silo, have it shipped early and haul in the winter on good roads. CORN BELT hollow tile silos thoroughly and beautifully glazed are permanent, fireproof, paint proof, repair proof. Include tile chute, tile feed room, steel back ladder and hip roof rafters. Special discounts for early shipments.
The Corn Belt Silo Company
Evanston, Illinois Brazil, Ind.

Kill Rats New Way
In France the World's greatest laboratory has discovered a germ that kills rats and mice by science. Absolutely safe. Cannot harm human beings, dogs, cats, birds, chickens or pets. Quickly clears dwellings and outbuildings, with no offensive after-effects. It is called Danysz Virus.

FreeBook Get our free book on rats and mice, telling about VIRUS and how to get some.
M. Y. Virus, Ltd., 121 West 15th St., New York

EDITORIAL COMMENT

AN old subscriber in writing us says: "The flight of years has put me amongst the down and out class. I well remember your father's good advice to us at the farmers' institutes about forty years ago in my old home state, Wisconsin, 'to put our trust in the dairy cow', which I have done for a good many years, both in the old home state and in the West, and I have found his advice good. But now I find myself beyond the age of active dairy work and having sold the farm, I will, in closing my pleasant relations with Hoard's Dairyman, say Godspeed in the good work you are doing."

There is high remuneration in a communication of this character, for in the years of active dairy work this subscriber found the advice of Hoard's Dairyman good and he has not been disappointed in following the footsteps of the cow. There is also an element of sadness in it, for the active work of life is done. There is melancholy in the closing days of life, but if a person has lived well and contributed his share to the progress of the world there is a satisfaction and a compensation which only comes to those who have done their duty.

IN one of the schools of Indiana an experiment was conducted to determine the effect of feeding the children a liberal quantity of milk. One boy, who had trouble with sore eyes and was undersized and listless, showed marked improvement when he was placed in this test. The account of this case comes to us as follows:

"This was very interesting. The boy had been treated for trachoma for a year and his eyes would not respond to treatment after a certain stage was reached. His teacher reported that he had 'no energy at all either for work or misbehavior. He has no interest, no effort, no life at all. He just sits.' The first two weeks he gained 1½ lbs., and his eyes lost all the inflammation. At the end of the third week the medical examiner inquired if he was in the test and when told he said, 'That accounts for his sudden and wonderful improvement.' By the end of the fourth week, he had totaled a gain of 2 lbs. His interest in school had increased and he was able to make an effort. Withdrew from test at end of fourth week. A visit to this boy at another school at the end of nine weeks showed his eyes reverting to the old condition and his attitude in school the same as formerly. The mother had promised to increase his allowance of milk and butterfat."

"NO MONEY FOR DAIRYMEN"

A prominent banker in the West at a banquet held at Spokane, Wash., recently made this statement: "I would not lend a dollar to a farmer to purchase dairy cows." This man is extremely ignorant of the dairy industry and someone should take the trouble to inform him of the stability of the dairy industry and those engaged in it. He little appreciates that dairying is the most substantial and safest branch of agriculture to follow and that men who are willing to milk cows are among the best class of farmers. He does not appreciate that the cow is a soil builder; that she produces the best and most important food, one that is indispensable to the human race; that she is the most economical producer of food; that her crop never fails and she produces an income every day; that she gives the whole family an opportunity to work and earn; that she utilizes feeds that would be wasted without her; that she furnishes the best market for hay and increases the prices of all crops.

This man has heard the complaint that dairy farmers are producing milk below cost of production, and this is true. It is also true of other crops when we take into consideration every phase of their production, including cost of labor, interest, depreciation, soil fertility, etc. This man fails to recognize that farming, especially dairy farming, is a family job and that neither the labor of the family has been paid for at market price nor has the fertility of the land, taken away by the crops, been charged against them. The stubborn fact remains that notwithstanding dairy farming has not been upon the same business basis as is manufacturing, it is none the less a most substantial industry and is so considered by bankers who understand the cow and the people who care for her. In dairy sections the farmer has no difficulty in borrowing money to buy cows. For the development of the dairy industry the bankers must be informed upon the stability and sincerity of the dairy cow.

IT PAYS TO KNOW

A dairyman who takes pains to know what every department of his farm is doing and the returns it gives, finds opportunity for improvement and increasing his returns.

The members of the Bashaw—Webster (Wis.) Cow Testing Association, when started February 1, 1920, had 9 scrub bulls but these have been disposed of and the association now has 100% purebreds. The members have also purchased 31 purebred females. Ten of the members now have purebred females when at the beginning there were none. Five members have installed drinking cups, assuring their cattle of an adequate supply of water at all times. One herd has been tuberculin tested and one member has had a milking machine installed. Twelve cows have been sold as being unprofitable and four good cows have been sold at a profit for dairy purposes.

The work of the cow testing association is pointing out to these men the necessity of better cattle and has led them to discard unprofitable cows and to improve their methods of handling their herds. It is not only revealing to them the individual differences of cows but it is stimulating them to be better managers of their herds. This cow testing association is revealing new methods of dairying and is creating a deeper interest in the work of caring for the herds.

BUYING FERTILITY

The good farmer studies his soil to determine how it can be treated in order to give him the most profitable returns. Soils vary in their composition, in their physical properties, and require various treatments in order to yield the best crops. It is quite the common practice to purchase so-called balanced fertilizer when in reality there is no such thing. The so-called balanced fertilizer contains phosphorus, nitrogen, and potash in varying amounts. Some soil may require all these elements but in a majority of cases more profitable results will be obtained if the farmer will apply separately the element or elements of fertility which his soil lacks.

It has been found that most up-land soils which have been cropped for a series of years lack in the element phosphorus and have an adequate supply of nitrogen and potash. This is especially true on dairy farms where legumes are raised and a large portion of the crops produced on the farm are fed to live stock. Most dairy farmers will find that it pays to use some phosphorus, for their soils lack this element.

It has been the practice for years on Hoard's Dairyman Farm to apply phosphatic fertilizers. We have used raw rock phosphate at the rate of 500 to 1,000 pounds per acre or 50 to 60 pounds per load of manure. We have also applied acid phosphate at the rate of 250 lbs. per acre when immediate returns from phosphorus were desired. We have found that the use of these phosphatic fertilizers has paid.

The Missouri Experiment Station reports that phosphatic fertilizers bring a return, on the average, of over 350%, while the use of potash, 46% and manure, 220%. Low lands, lands that usually require tiling, especially of a swampy nature, respond, as a rule, admirably to 200 or 300 pounds of some potash compound per acre. In our own experience we have found a six-acre field yielding no satisfactory crop except timothy but by applying a ton of muriate of potash to the 6 acres, one of the best corn crops ever grown on Hoard's Dairyman Farm was raised on this land. It would have been no advantage to this field to have applied nitrogen and we doubt whether phosphatic fertilizer would have paid, but the land did lack potassium and, because of the application given it, profitable crops have been produced for seven or eight years.

It therefore pays to know the kind of elements of plant food the soil lacks in order to supply it with the greatest economy. If the land needs phosphorus, buy phosphorus; if it needs potash, buy potash; if it needs nitrogen, buy nitrogen. When the soil lacks all three of these elements, buy them but try to determine what proportion of each one should be applied. Money can be saved and better crops grown by applying to the land the elements of fertility that are deficient.

COW TESTING DIRECTORY

The Dairy Division has recently published a directory of the cow testing associations in the United States which were active July 1, 1920. This directory lists 468 associations in 36 states. The leading state is Wisconsin with 115 associations. Pennsylvania comes second with 64; Ohio third with 41; New York fourth with 28; and Illinois fifth with 23. No other state has as many as 20. This directory shows the growth in the association movement from 1906, when the first was organized in Michigan. Four years later 40 were in operation. In 1913, 100 were organized, and by 1917, 459 were running. Scarcity of testers in 1918-19 cut down the number to 353 and 385 respectively. The return for 1920 to 468 is indicative of the promised increase which can be looked forward to in coming years. The number of herds in these 468 associations is 11,948, the number of cows under test 203,472. The average number of herds in each association is 25.5 and number of cows per association 434.

Introductory to the directory as published is the following statement by the Dairy Division: "Is cow testing worth while? Ask the dairyman who has recently joined a cow testing association, and he will seldom answer 'No'. Ask the dairyman who has seen the profits of his herd more than doubled through the work of the association and he will never answer 'No'. Ask the breeder of high class pure-bred dairy cows, after he has sold a bull calf from a record cow for a thousand dollars, and he will always answer 'Yes.' Cow testing is not worth while to the dairyman who makes no use of the records and who continues the doubtful practices of former years, but cow testing is worth while to the dairyman who desires to feed and breed according to known production. In dairy herd improvement knowledge alone is nothing, but knowledge followed by intelligent action is everything. To the man who belongs to a cow testing association, who studies the individual records of his dairy cows, and who selects feeds and breeds according to those records, cow testing is and always will be well worth while."

Storing Tops With Beets

I have harvested some mangels and beets which, because of the poor quality, were not topped. I have read somewhere that fermented beet tops were poisonous to cattle. It had been my plan to store these beets and mangels, and feed them out without topping, but I am puzzled as to whether I dare to do so.

Tomahawk, Wis. G. M. S.

Beet tops are considered a fairly satisfactory feed for cattle and they are fed in considerable quantities in many sections. There is some danger

that if fed in too large quantity they will tend to purge the cattle and for this reason they should be fed in a somewhat limited way and preferably in connection with some dry roughage, such as cut corn stover, straw, or hay.

Unless there is some unusual fermentation, beet tops will not be poisonous; indeed, we have heard of no cases of poisoning cattle through feeding these tops.

There is some question in our mind as to whether the contemplated system of storage would prove practical from an entirely different viewpoint. While we have had no personal experience and do not recall that the matter has ever been brought to our direct attention, we would fear that this method of storage would result in spoilage of the beet roots, as well as the tops. This is due to the fact that by storing in this manner the beets and tops will not pack closely together so as to exclude the major portion of the air. As long as there is any air entrapped with this mass of material there will be a considerable amount of mold developed and consequent spoilage. Such spoiled feed cannot be considered good for cattle and there is some question as to whether it might not even prove harmful. There is a difference between fermentation of beet leaves when packed in a solid mass and the fermentation or rather spoilage that comes when the leaves are kept apart by the beet roots. It is much like attempting to make silage without compacting the cut material so as to exclude air.

Overcoming Sorghum Poisoning

HOARD'S DAIRYMAN:—The article on sorghum poisoning by Ralph Kenney in the Nov. 12 Hoard's Dairyman I have read with interest and also the editorial comment on the same subject, especially Professor Fitch's views.

This past summer I spent considerable time in the harvest fields of western Kansas and eastern Colorado where a great deal of the sorghums are grown. I saw very little Sudan grass or sorghum being pastured. Most farmers seemed to be afraid of them for pasture although these are the main winter roughages. In June, 1920, occurred one loss with which I am personally acquainted.

In Lane County, Kansas, I spent some time on the farm of Mr. Jed Ramsey at Dighton. Here a neighbor lost nine head of cattle all in an hour or two one morning. His cattle broke through a fence into a neighboring field of cane. This was in June when the cane was young. None of the cane in the vicinity was stunted at this time either but the cattle succumbed to forage poisoning just the same.

Mr. Ramsey, at whose farm I was, is an experienced farmer from southeastern Kansas who has been farming in western Kansas the last four years—and, incidentally, he likes it. He realizes the troubles of the newcomer in that section in regard to forage poisoning.

"Too bad," he declared when he heard of his neighbor's loss. "That could easily have been avoided, though. Why is it we all have to learn by some sad experience like that? If those cattle had been used to eating cane, none of them would have been poisoned. I always raise small amount of cane right in the pasture where I keep my cows. They eat at it and are used to it all summer long. They sometimes break through the fence and get into large fields of cane but it doesn't affect them in the least as they are already used to eating cane. I have not lost any although many times they eat a great deal of cane when they break out."

Mr. Ramsey's statement I found to be correct as the cattle broke into a cane field twice while I was there and were eating cane for a long time before they were noticed. It seemed to harm none of them.

This western Kansas farmer may not know the scientific reasons for forage poisoning, as prussic acid, etc., but he has found and practiced a very simple and effective method of prevention. His idea is that cattle are bound to break through fences at some time during the season especially during the dry midsummer. He aims to be prepared for such occurrences by growing a little cane in his pasture since he believes most cases of forage poisoning are due to a sudden change from no cane to plenty of it. This is in accordance with the ideas of Professor Fitch of the Kansas Experiment Station and advanced on the editorial page of last week. Whether the theory of the cause is right or not, Mr. Ramsey's method of prevention has proved a good one and is practiced by old timers in that section.

The farmers of the Southwest are all aware of the danger of forage poisoning but some do nothing to prevent losses of their cattle. This possibility of forage poisoning plays a bigger part in the summer business of the farmers of this wide sorghum raising section than those who reside in other sections are apt to realize.

Wisconsin. G. H. CLAPP.

Blood in Milk

There is a peculiar state of affairs in the herd of one of our creamery patrons. His milk apparently is all right but when run through the separator the skimmilk shows blood streaks in it and when set to ripen next morning will be all separated and does not clabber like it should, besides it has a bad smell to it after 12 to 24 hours. At times the milk from this herd would clear up and again come back without apparent cause. The cows run on native pasture and are fed well. Apparently everything in connection with the dairy is clean and well kept.

Orlando, Fla. L. B.

Bloody milk may be the result of either of two causes. The milk may contain blood as it comes from the cow's udder, being caused there by injury, a diseased condition, or a fevered condition; or bloody milk may be caused by bacterial growth from an organism which reaches the milk after it is drawn.

In the first case, it is very likely that a few, at most, of the cows in the herd are affected. The milker should discover which ones of his cows produce bloody milk. It may be necessary for him to keep separate samples of milk, but it is likely that by very careful examination as the cows are milked, he can discover which ones, if any, of the cows are so affected.

If this diagnosis fails, the next most likely cause of this condition is a bacterial infection after the milk is drawn. We can only suggest in this case the thorough sterilization of the utensils with which the milk comes in contact. It is quite common for blood to occur for some time in the milk of a newly calved cow. Heifers with their first calves are often affected. Congestion or gorging of the mammary gland with blood causes rupture of minute blood vessels so that bleeding, severe or slight, results. As a rule, this condition soon subsides and that may be hastened by feeding a very light ration and giving a handful of glauber salts in feed or water two or three times a week. In persistent cases, however, it may become necessary to bathe the udder with vinegar and water or alum solution two or three times daily and give one dram of dried sulphate of iron and three teaspoonfuls of salt in the feed twice a day until bleeding ceases. In old standing cases, affecting but one or two teats, growths in the milk ducts are the usual cause, and if they cannot be removed by operation, the cow should be allowed to nurse calves or should be "dried off".

May we ask a favor of our readers?

Will you take just a moment's time—and glance at the address label on your paper?

And if you find these figures "Dec. 20" or "Jan. 21" on the label, will you please send us your renewal order—today?

1 year $1 3 years $2 5 years $3

If you want to do us a favor, and assure yourself of not missing a single issue of Hoard's Dairyman, mail your renewal now. Thank you!

Cream Thickens in Making Butter

My cream gets as thick as soft butter and only tests from 28 to 30 per cent. Then I heat it and it takes three hours for butter to come. I have to churn at 64°F. now. I follow the same system for ripening and churning but since we have been feeding dry feed, it has been getting thick. Sometimes my butter is streaked. Is it because it gets too cold? Is it all right to heat the cream by putting a clean steam hose in the cream and heating it? Please tell me how to remedy this.

Simmons, Ariz. J. F. Y.

The thickness of the cream noticed in this particular case must be due to some peculiar fermentation which takes place in it, especially as the cream tests only about 30% fat. One way of determining definitely whether or not this is the correct explanation is to heat the cream while it is sweet up to a temperature of 150°F., hold it at this temperature 10 minutes, then cool at once to near 50° if possible and let it sour in a clean vat or can after this heating. If the unusual thickening is due to a special fermentation that takes place, this heating or pasteurizing will destroy that ferment and when the cream is cooled it will return to its normal consistency. Such pasteurized or heated cream may be soured by holding it at a temperature of about 60 degrees for 24 hours, then cooled to 55 degrees and placed in the churn at this temperature.

The streaks noticed in the butter are probably due to the uneven mixture of the salt through the butter, or the incorporating of too much curd or buttermilk in the butter. The best way to remove the latter is to wash the butter in the churn when the granules are about the size of wheat kernels by pouring a sufficient amount of cold water into the churn so that the granular butter will float on the cold water; then revolve the churn three times and draw off the wash water. Such a washing as this ought to remove the surplus buttermilk, but in case it does not and the last water drained from the churn is milky, the washing process may be repeated a second time. This, I am sure, will take out all the curd that may be left in the butter and should help to remove the streaks now noticed.

I do not think it is a good practice to heat cream by putting "a clean steam hose into the cream and heating it". This hot steam is likely to coagulate the curd in the cream into hard lumps which will probably be mixed with the granular butter when the churning stops and by working these hard lumps of curd through the butter cause the streaks you have noticed. The best way to heat the cream is to set the can of cream into a larger can of hot water and then stir the cream until it reaches the desired temperature. After heating, the cream must be cooled to near 55 degrees F. before churning.

Wisconsin Dairy School. E. H. FARRINGTON.

Shipping Calves

I noticed quite a writeup about the "Whitewater Calf Industry". I want to give you a little of my experience and observation in regard to the calf industry. A friend of mine sent for two Holstein heifer calves last spring. They were to be six weeks old at time of shipping. One was four or five week old and the other about one week old when shipped. He wrote the man he bought them of complaining about the age and size of the calves. The seller wrote and offered another one at reduced price to satisfy the buyer. He sent it C. O. D. and my friend paid for it and kept it.

I sent for four Guernsey heifer calves last spring and had them sent to a farm I own in Missouri. All were to be five or six weeks old. I am sure there was none of the four a month old and one was not ten days old when received at the farm. The calves arrived in a very weak condition. The youngest one came very near dying as a result of the trip. Three are grade Guernseys and the fourth one has got me guessing. It is red and white and as speckled as a coach dog. I presume it is an Ayrshire by its looks and the way it is outgrowing the others. It is not hard to tell why so few are returned when sent C. O. D. The shippers know they must send something near what they sell or have them returned. On the other hand, if they have their money and ship later they can send the ones they would not dare ship C. O. D. and some of the dealers are dishonest enough to do it.

Kansas. E. A. D.

(Editors' Note:—It is doubtful whether a shipper can afford to consign calves C. O. D. There are rascals among buyers as well as many sellers, added to which there may be the faint hearted buyer who does not understand that a calf shipped a long distance will not look its best upon arrival. This might lead to the rejection of a perfectly healthy calf and entail considerable expense to the shipper when he was not at fault. This method of purchase is not highly desirable unless the seller has faith and knowledge of the buyer's honesty and integrity.)

Cheese Markets Steady in Face of Lighter Demand

[Report by U. S. Bureau of Markets]

While the week ending Nov. 20 was marked by fairly good trading in the cheese market with values generally well maintained, conditions seem to point to the fact that prices are close to the top now especially at primary markets, and that further advances such as those of the past few weeks are not likely to occur in the immediate or near future. In Wisconsin the feeling is current that the usual light buying from Thanksgiving time until the Christmas holidays will be further supported this year by the fact that a good deal of buying lately has been to replace depleted stocks, and that this trade has just about obtained its requirements.

Favorable fall weather led to considerable buying for storage purposes during past weeks, as quality has been running as good as regular September and October make, but with quality now beginning to go off this trade will cease to be a factor. Some price changes bringing different styles into line with each other may occur, but there are just as likely to be declines as advances. A number of factories have now turned to making those styles on which a particular heavy demand has caused prices to become highest.

Eastern Markets Still Confident

Reports from eastern distributing markets indicate that dealers have a fair amount of confidence in the present situation. As was mentioned last week, there is more definite information regarding the condensery milk surplus as it bears on cheese production, and it appears that a lot of this milk is going into other channels. It is also true that demand for fancy cheese has been and still is very good, and that receipts have fallen off somewhat and offerings in the country continue to become lighter. The Chicago market, however, does not share fully in this feeling, for trading there shows an unsettled undertone, and it is doubtful whether present prices can be maintained. Prices on both held and fresh cheese advanced slightly in distributing markets generally and held cheese is firm if of good quality. Dealers holding blocks of fancy in storage are making no particular effort to push sales.

Common Fall Defects Appear

Some of the fresh cheese appearing on the markets is beginning to show up poorly. Many lots are running irregular, and pasty texture is common. The fact that demand centers on fancy stuff is apt to make medium and undergrade stock hard to move, and for this reason there will be some tendency for dealers to hold off on lots which are at all unsatisfactory. Even now the market on undergrades is beginning to ease off some. Skim cheese reaching markets finds practically no demand. Export business is quiet, as it has been for some time, and inquiries are only occasional.

The average wholesale prices on American cheese (style Twins) for the week ending Nov. 20, 1920, and for the corresponding week last year, were as follows:

	Week ending Nov. 20 1920	1919
	cents	cents
New York	27.8	31.7
Chicago	25.2	30.4
Boston	26.0	32.7
San Francisco	30.4	32.1
Wisconsin Board	25.3	30.8

The receipts of American cheese at the four markets first given and at Philadelphia totaled 3,309,126 lbs., as compared with 3,501,082 lbs. for the corresponding week a year ago and 3,283,096 lbs. a week ago.

League Reduces Milk Prices

THE Dairymen's League directors have voted to sell December milk for $3.18. This is for milk testing 3 per cent butterfat at the 200—210 mile zone with the usual differentials for freight and butterfat.

Although it has been the custom for fifteen years, because of increasing costs of producing December milk, to sell it for more than November milk, this year's December price will be 47 cents a hundred or one cent a quart cheaper than the November price. The directors found that the majority of sentiment among members of the organization was for lower prices and that such lowered price should be passed on to the consumer. This is in line with what is taking place in the prices of all other products and commodities, and it is thought it will tend to increase the consumption of milk at a time when there is a surplus in League territory due to the fact that much of the milk which formerly went to manufacturers is not now being taken by them.

Borden's Farm Products Company has announced that it would pass the full reduction on to the consumer. It is expected that other distributors will do the same. Even at this reduced price, the manufacturing dealers who have refused to buy milk since October 1st will probably not buy milk of the Dairymen's League during December. As proof of the fact that these companies are not so much interested in not buying milk as they are in trying to break the farmers' organization, they are now, particularly the Nestle's Food Company, offering to buy milk of farmers in many sections at full League prices, providing the farmer will deal with them as an individual and not through his organization.—E. R. EASTMAN, Editor Dairymen's League News.

Review of Grange Conclave

On the eve of the adjournment of one of the most important sessions ever held by the National Grange of the Patrons of Husbandry, the results of its sessions can be summarized in a few paragraphs of much interest to American agriculture.

The Grange went on record in further continuance of its anti-class control program begun last year at Grand Rapids, Michigan, by adopting an open shop resolution in broad and undisputable terms, disapproving "any system which denies to any individual the right to work in any place where there is need for his industry at any time and at any wage which is satisfactory to him, or to quit his job for any reason which may be to him controlling."

On the tariff the resolution adopted was brief and forceful, demanding that "if a protective tariff is to be established as the policy of the government, then the laws must give agricultural industry the same protection as other industry."

On the land bank situation, the resolution endorsed the banks, and called for their support and legalized operation.

One strongly supported resolution called on the government to get out and stay out of business, specifying for immediate repeal laws creating the Food Administration, the Grain Administratnon, the War Trade Board, the War Finance Corporation, the War Labor Board, the War Finance Corporation, the Housing Corporation, all Fair Price Commissions, and "similar governmental instrumentalities."

A committee of three was authorized to present the Grange position to President-elect Harding, and another resolution set forth the fact that the Grange asked for the appointment of a real "farmer" for secretary of agriculture.

The Muscle Shoals Air-Nitrate plant matter was acted on, the resolution adopted favoring the operation of this plant by the government or by lease to a private corporation, whichever would prove to be most economical and effective.

A resolution was adopted favoring reclamation projects which would stand agricultural and engineering tests before their approval, and against wholesale appropriations for wholesale reclamation without such tests.

Grange co-operation in the effort to secure the meeting of the International Dairy Congress for this country in 1922 was unanimously voted.

The Grange voted to meet in 1921 in Oregon, with an agreement that Kansas would probably have the 1922 session. Leslie R. Smith was elected on the executive committee, giving Massachusetts this important place, and Worthy Master S. J. Lowell to the board of managers of the National Grange Monthly. A. M. LOOMIS.

There's a difference between feeding cows so they can exist and feeding them so they can produce milk.

Waukesha Holstein Sale Tops the Circuit

Once more Waukesha County Holstein breeders head the Wisconsin sale circuit by selling 78 animals for $37,605, just short of a $500 average. This is by no means the first time this has happened. In fact, for several seasons the Waukesha sale has topped all other county Holstein sales in the state, so it comes as no surprise this time, although it is worth while considering.

Seemingly the Waukesha County breeders have reduced the public sale business to a system that works every time. They get good cattle, have them in sale shape, advertise well, and the net result is a most successful sale whether you judge by the price average or the crowd in attendance (this year, the cattle sold to five different states).

Much of their present success is, of course, due to the fact that for years they have used the best of sires in the county and through their advertising have kept breeders everywhere informed of the quality of their cattle.

Four animals reached a four-figure price with Carnation King Ormsby Mercedes the top animal at $6,200. He is a 10-month-old son of Carnation King Sylvia out of a 34.55-lb. daughter of S. P. O. M., the first bull carrying this combination of breeding ever offered for sale. He was consigned by the Carnation Stock Farm and purchased by H. A. Nelson and Clinton Skewes of Wisconsin.

Second honors in the price list went to the Gustav Pabst Farms on a seven-month-old son of S. P. O. M. 41st out of a 29-lb. year record dam. He was purchased by Lawrence Murphy and Wittig Bros. of Wisconsin.

Mack, Krause, Love, and Benjamin did the selling with Sale Manager Baird in the box.

The following list includes all animals selling for $500 or more and purchasers:

N. J. Swan, Wisconsin	
Sissy Mercedes Johanna De Kol	$500
Jessie Fobes Pietertje De Kol 2d	550
Wm. J. Staah, Wisconsin	
Fancy Johanna Perfection	$550
Williams Bros., Wisconsin	
Pauline Pontiac Dairy King	$570
Clinton Skewes, Wisconsin	
Daisy Johanna Pauline Portage	$500
H. E. Dickinson, Wisconsin	
Johanna Fern Cliff McKinley	$790
J. H. Smith, Indiana	
Gem Korndyke Jewel 2d	$500
Swandale Orange Blossom	630
W. E. Peterson, Minnesota	
Corona Canary Johanna Ormsby	$650
J. A. Craig, Wisconsin	
Minnie Johanna 6th	$510
G. K. White, Illinois	
Pabst Creator Shadeland	$1,000
H. W. Core, Wisconsin	
Jessie Belle Empress Ormsby	$595
L. W. Frey, Wisconsin	
Sir Korndyke Fytje Pietertje 26th	$550
Jelke Dairy Farm, Illinois	
Sir Ormsby Johanna Lockhart	$500
N. F. Rother, Wisconsin	
Swandale Pontiac Aaggie	$700
Zeffie Aaggie De Kol 3d	750
Mitchell Bros., Wisconsin	
Nockdair Pontiac Aaggie Lad	$1,400
J. H. Jungbluth, Wisconsin	
Wisconsin Star Pontiac 4th	$550
H. A. Nelson, Clinton, Skewes, Wisconsin	
Carnation King Ormsby Mercedes	$6,200
Wittig Bros., Lawrence Murphy, Wisconsin	
No. 73	$1,500
H. A. Nelson, Wisconsin	
Denman-Dale Queen Champion Rag Apple	$520
W. H. Wilson, Wisconsin	
Princess Lyons Korndyke	$850

South Carolina Jersey Makes 375 lbs. Fat

The Jersey cow, Fern Princess of Suncrest, recently exceeded the South Carolina state record for three-year-olds by 53 pounds of fat. Starting at the age of three years and five months, she produced 7,482.7 pounds milk, 375.24 pounds fat. She was started on test by J. Hickson and sold to Charles B. Whitney before the completion of the test.

The Seattle Strike Settled

Commission Sets Price of $2.90 for 3.6% Milk

A. D. HURLEY, WASHINGTON

SEATTLE'S "milk controversy" which began early in October when producers, through the officials of the United States Dairy Associations, demanded a raise from $3.65 per hundred for 3.6% milk to $4.17 per hundred for milk of the same test has been concluded, for a time at least. At that time a milk commission was appointed by Mayor Hugh M. Caldwell. Both sides agreed to abide by the decision made by this commission for a period of one year. Following is the main part of the report submitted to the mayor by the commission:

In looking over the field of investigation for your commission it was discovered that there are some 370 producers shipping milk into the Seattle market, and some 60 distributors getting this milk to the consumers either through stores, restaurants, or delivery vans and wagons. The commission deemed it necessary to try and reach every one of these producers and distributors. Accordingly a questionnaire was prepared and sent out to each of them. Although the commission has not been able to get responses from all the producers, or all distributors, nevertheless the responses have been such that the commission has at its disposal testimony covering far more than fifty per cent of the packages handled by the distributors. All the larger distributors have responded. A few of the minor distributors have failed to heed the call of the commission.

With the information thus obtained the commission has felt that it has been put in possession of facts sufficiently widespread to enable it to arrive at safe conclusions.

Proceeding in the natural order from farm to home, the commission wishes to submit first their findings with regard to production. After mature deliberation we are convinced that Pearson's formula is the best basis known to us for figuring cost of production. This formula is the result of investigations carried on by Professor Pearson of the University of Illinois, covering a period of some two years. It is supposed to be applicable to any portion of the United States. He has reduced all of the items of feed handled and the cost of production to the equivalent classed under four general heads. For one hundred pounds of milk the cost is equivalent to twenty pounds of home grown grains, twenty-four pounds of purchased grains, one hundred ten pounds of hay, and three hours' labor.

If Seattle consumed all, or nearly all, of the milk produced in its immediate vicinity, your commission could set a price insuring the producer cost of production or even a profit; but the fact is that at the present time Seattle probably does not consume more than twenty per cent of the milk produced in the Seattle milk shed. This means that eighty per cent of the milk produced in this district must find other markets. These markets are principally the condenser, butter manufacturer, and cheese manufacturer. If your commission, in its attempt to give cost of production to the producer, should set a price too far above the price of these products, it is obvious that this eighty per cent would immediately seek the more remunerative market, and by such competition force prices down and disorganize market conditions, and also possibly flood the Seattle markets with an inferior grade of milk. For this reason the commission has decided, in arriving at a final price to be awarded the producer, that not only should the cost of production be taken into account, but also the market price afforded by the three outlets above referred to.

In connection with the butter price, the commission has decided to take the average being paid for butterfat in four co-operative creameries in this district, and to add to this price a flat allowance of fifty cents for the skimmed milk contained in one hundred pounds of raw milk. This gives the producer all the possible advantages of this market inasmuch as the co-operative creameries are supposed to eliminate some of the middleman's profit.

In arriving at the price per hundred weight of milk through the cheese market, the commission has taken the f. o. b. price at the co-operative cheese factory of Tillamook, Oregon, which has been successfully conducted for the past several years. Four cents per pound has been deducted from this price to cover the cost of manufacturing. In this item the commission has also made an allowance of twenty-five cents for the whey contained in one hundred pounds of raw milk. This is taken from authoritative sources which regard whey as having half the feeding value of skimmed milk.

Taking all of these items and finding the results for milk containing 3.6 lbs. butterfat per hundred weight, we have the following:

Condenser	$1.89
Butterfat at 61c per lb.	2.20
Skimmilk	.50
Cheese	2.50
Whey	.25
Cost of production	4.26
Average of four items	2.90

Lest the price thus obtained, however, should be too far out of line with the average of the three possible markets referred to above, namely, condenser, butter, and cheese, the commission has further decided that the price thus arrived at shall never be less than fifteen per cent above the average of the three items before mentioned, or more than twenty-five per cent above the average of the three items. This added price allowed to producers for the Seattle market is awarded by the commission as a premium for producing a high quality of milk and to insure a continuous flow of such milk into Seattle markets.

We, therefore, recommend that the price of 3.6 per cent milk be $2.90. We also recommend that for every point in butterfat above or below the 3.6 per cent a variation be made in the price of $2.90 equalling one-tenth of the price of butterfat on the Seattle market. To illustrate, at the present time the price of butterfat is 55 cents. A man marketing four per cent milk instead of 3.6 per cent would be entitled to a premium of 22 cents above the price of $2.90. On the other hand, if the producer were marketing 3.2 per cent milk he would have a corresponding cut below the price of $2.90. We recommend that the price of $2.90 here fixed go into effect November 16th, and continue in effect until January 1st; that not later than December 25th and the 25th of each succeeding month, the price be readjusted for each succeeding calendar month on the same basis as the price here arrived at, and that this adjustment be made by the Seattle Department of Health and Sanitation.

One of the troublesome problems for both producer and distributor is the disposal of the surplus supply of milk which is afforded at certain times of the year. On this point the commission has decided that the shipper shall be entitled to send to his distributor, through April, May, June, and July, the ordinary months of surplus, an amount equal to the average of his shipment for the preceding eight months. During the four months of April, May, June, and July any excess above this average may be shipped to the distributor, and the distributor shall allow the producer for the butterfat in his milk at the rate of ten cents per pound more than the running price of butter print on Western Avenue.

In considering the problem of processing and distributing milk in the Seattle market, your commission believes that it has been put in possession of basic facts. As pointed out previously in this report, we had most helpful co-operation from the major distributors. Certain preliminary features should be called to the attention of the public. In the first place, the Seattle housewife thinks in terms of quarts of milk left at her door. As a matter of fact, only about ten per cent of the milk brought into Seattle is thus distributed. Ninety per cent reaches the consumer through cafes, restaurants, hotels, markets, and grocery stores. The marketing of the ninety per cent in this way has both a beneficial and a depressing effect. It is beneficial in that it no doubt increases consumption of milk and reduces the average price to the consumers who get their milk in this particular way. It is depressing or hurtful in that it increases the cost of distribution to the consumers who have their milk delivered at the door. Possibly not more than two or three houses in a block receive milk from a dairy wagon, while the other houses will be supplied from the grocery stores. This means that the route of the dairy wagon is greatly lengthened in delivering a fixed number of packages. Another point that the public should be made aware of is that about eighteen per cent of the cost of the packages delivered at the door may be charged up to labor. This charge does not include office salaries or expenses of management, but it is chargeable alone to manual labor in processing and delivering.

To repeat, the housewife thinks in terms of quarts of milk, but the distributing cost is better figured in packages of delivery. Your commission has found that the four leading distributors in the city have delivered in the first eight months of 1920, 15,540,390 packages. The margin of profit in handling this vast quantity of milk is so slight that one-fifth of one cent per package less would more than eliminate the profit of the four concerns; while one-fifth of a cent per quart more would practically double their profit. The same condition we have found true for the entire year of 1919. These conditions warrant us in reaching a conclusion that competition has kept the margin of profit for the retailer down to the lowest possible level.

The housewife may be curious to know why, if this margin of profit is so slight, her price on milk delivery at the door always varies in terms of full cents. The fact is that the distributor frequently delivers one type of package at a loss because of the necessity of dealing in even money. He will then make up this loss in the sale of other packages. Only wise and careful management can keep the adjustment of the prices on these different packages at a point that will insure safe business.

Because of this narrow margin and the delicate adjustment necessary to conduct the business safely, your commission deems it unnecessary and unwise to attempt to set a price to the consumer.

In conclusion we would point out that the price charged for milk by restaurants and cafes is beyond the control of the distributors and of your commission.

Clearing Eighteen Hundred Acres

HOARD'S DAIRYMAN:—Marinette County, Wis., added to its cultivable land in 1920, through a clearing campaign, 18,000 acres. This is enough land to support 6,000 cows and as dairying is the principle business of the county the importance of the work accomplished by the Marinette County Land Clearing Association at once becomes apparent.

General satisfaction throughout the county was expressed in a celebration and land clearing roundup recently. The celebration centered at Wausaukee, where Larry F. Livingston, directing engineer of the association, maintains his headquarters. Automobile trains from all quarters carried thousands to "the land clearing county seat", the principal one going from the city of Marinette. In this train Dean H. L. Russell of the College of Agriculture rode as the guest of honor of the celebration.

The Marinette train paused at the various towns, and at Crivitz and Coleman the tourists were entertained during brief stops. Enroute this train paused long enough to see 300 feet of ditch "blown" with a single shot of dynamite. This was the first of two spectacular demonstrations of land clearing methods. The second was at Wausaukee and was the feature of the celebration. After delivering an address Dean Russell threw a switch that set off an acre of 125 stumps, a mighty blast that cleared one more acre in record time.

Wisconsin. LEO P. COOK.

WAITING FOR THE BLAST

An acre of stumps was blown at one blast to celebrate the close of the land clearing campaign conducted in Marinette County, Wisconsin. There were 1,800 acres cleared, which required the use of 314,000 lbs. of explosives including 26,000 lbs. of T. N. T.

It's all in the package

EVERYTHING else equal, people buy what looks best to them. People have been educated up to the parchment wrapper idea. It looks clean—and it *is*. It looks as though it keeps butter better, fresher, sweeter, more wholesome—and it *does*.

Where people have the choice they *buy* the better wrapped butter naturally, where they'd have to *be sold* the same butter, unattractively wrapped.

Buy Paterson Vegetable Parchment Wrappers in lots of 5000 or more, and we'll print advertisements on them displaying your brand and trade mark to the very best advantage and guaranteed not to stain the butter.

And then watch your butter sales grow.

Saves Half of My Meat Bills

Sectional View of the Original National Giant Smoke House. Beware of Imitations or Experiments.

NATIONAL GIANT PORTABLE SMOKE HOUSE AND SANITARY STORE HOUSE

This is the same Smoke House used by Governor Cox of Ohio; by big breeders and farmers all over the country. In use on Agricultural Experiment Farms; pictured in a leading article by Country Gentleman, and recommended by Farm Paper Publishers all over the land.

NOTICE—Get the Original National Giant Portable Smoke House. Beware of Imitations or Experiments.

A 7-Years' Success

Thousands of farmers in the U. S. and foreign countries will tell you that the National Giant Smoke House saves half their meat bills—gives them better, sweeter meat, fish for their own table. The wonderful National Giant Smoke House is portable; can be operated indoors or outdoors. Made in 3 sizes. Runs on sawdust and cobs and a little bark for seasoning. After smoking meats, use for store house. Fly and bug proof. Keeps meat without sacking. Worth its price many times over for this storage feature alone.

Now in Use on Thousands of Farms in U. S. and Canada

Send for FREE Book Contains valuable prize-winning recipes for curing and smoking Hams, Bacon, Sausages and Fish at home. Gives full description of the original National Giant Smoke House. Quotes prices and gives other details. Write for it today.

(Continued from page 873)

be secured. It is maintained that in the settlement additional recognition of the association was secured; the dealers having heretofore insisted upon buying directly from the producer. Yet the contract as agreed upon is made by the distributors with the producers as individuals and not with the association.

Two Important Developments

Two things have developed during the past two months which claim attention in the future. The first is the application of the board of directors for a charter in the American Federation of Labor. Labor leaders in St. Louis urged this action. In the association it was sponsored by D. A. Brooks, president, and N. E. Baum, secretary, but did not have unanimous approval from the board. The benefit claimed for producers from this move comes through the distribution and labeling of their milk as a union product. With a producers' distributing agency it is said that the 85,000 union labor families would guarantee the business that number of patrons at the beginning.

The other development is the plan to start a producers' distributing plant, with bottling plants at Highland and other points. More than $100,000 has been subscribed for the Highland building. This movement is fostered by the more conservative members. They favor plants to care for surplus milk, equipped for the manufacture of condensed milk, butter, or cheese. If it later appears necessary, they would introduce a system of distribution. This constructive plan seems to be the best thing brought about by the trouble this fall.

The basis for price fixing at St. Louis may make it uncertain for some months to come as to who won the milk strike and permit both producers and distributors to claim a victory. The season's experience very definitely indicates that prices are not now regulated by local milk supply, that transportation and prices in other sections must be considered. Also it demonstrates a gratifying loyalty among the members of the Southern Illinois Milk Producers' Association. Whatever may be the faults of the present organization, and however badly members may have fared in the strike now ended, it can be said they stuck!

Tenth Silver Medal Jersey Bull

Valentine's Ashburn Baronet, a Jersey bull owned by J. A. Dickson and Son of Oregon, is the tenth bull to be awarded the American Jersey Cattle Club silver medal. He is the fourth to receive this award in Oregon. Silver medals are given for bulls having three daughters from different dams which produce exceptional quantities of butterfat in a year and drop a living calf within 155 days of the completion of the test. This bull has sixteen Register of Merit daughters whose average record is 8,222 pounds milk, 470 pounds fat. One of the best of these records is that recently completed by Countess Stella of Ashburn. She produced, as a junior three-year-old, 11,002.5 pounds milk containing 783.32 pounds fat. In two years she has produced 17,927.4 pounds milk containing 1,265.66 pounds fat.

The frost is on the pumpkin now,
A sight to make men weep,
It's pretty and poetic, but—
A frosted punk won't keep!

65 Lb. LAMBS BY APRIL

ALONG THE Seaboard
the south's newest great railway

In Florida farmers get "hot-house" prices for pastured lambs. Ewes drop lambs from November to January which are pastured on oats, rye and rape. By April they have a well-grown, fat, 65-lb. lamb ready for market.

Two Crops of Corn

Corn can be planted in February, harvested in May; planted again in April and harvested again in September. Velvet beans, planted with the crop, give the equivalent of 16 additional bushels.

There are millions of acres of yet untouched by the plow, productive prairie lands—and hammock soils that grow 75 bushels of corn—and muck soils that produce even more. Model schools and churches, excellent roads.

Write for information about Fla., Ga., Ala., N. C., S. C. and Va. farm opportunities.

Empire Oil-Burning Tank Heater

Greatest improvement ever made in tank heaters. Fits any tank. Burns from 14 to 16 hours on one gallon of kerosene. Any child can operate it with safety; no sparks, ashes or smoke. The heating chamber is entirely under water; no heat wasted. Guaranteed. Saves feed—pays for itself repeatedly.

Empire Non-FreezableHogWaterer

Made of heavy galvanized iron — large capacity (70 gal.); drinking trough on outside where hogs can reach it; oil burner directly under trough—guaranteed not to freeze. Keeps water warm at a small cost. An abundance of fresh, clean water at right temperature. Keeps hogs healthy—fatten faster on the same feed.

FARMER AGENTS
Special offer to farmers willing to show our Heater and Waterer to prospective buyers. Write at once for price and special offer. Buy direct from factory.

10 Days Free Trial

Copyright 1920, by The Goodyear Tire & Rubber Co.

"The big Goodyear Cord Tires on our two motor trucks are helping us to reduce the high cost of farming. These pneumatics travel anywhere in the fields and, during threshing, enabled us to dispense with eight teams and eight drivers. We had had to pay the drivers of these teams up to $8 a day in addition to the cost of the teams and the outfits. Also we have sold pasture and bought farm land in place of it. There are many other savings—of labor, time and money. Due to the quickness of the big Goodyear Cord Tires, we now can make more hay while the sun shines."—M. W. Bever, Farmer, Colby, Kansas, Rural Route No. 1

IT is everywhere observable, as above, that the traction, cushioning and activity of Goodyear Cord Tires on motor trucks, effect large savings for farmers.

This traction overcomes handicaps of soft, slippery going, of weather and of grade which formerly caused hauling delay and added expense in all kinds of farming.

This cushioning safeguards loads liable to injury, shrinkage or waste when unduly jarred, and thus enables the sale of full quantity and quality at best prices.

This activity permits entirely economical hauling to and from motorized machinery, and by bringing more selling points within hauling range, often reduces marketing costs.

All these virtues of the big pneumatics are made most practical by Goodyear Cord construction which sinews them with unusual strength and endurance.

Farmers' reports on motorization and pneumatics will be mailed to anyone interested, by The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, California.

CORD TIRES

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, Nov. 24—Officials of the Dairy Division, as well as elsewhere in the Department of Agriculture, are much interested in the provisions in the plan which has been worked out by Secretary Meredith and his advisors for presentation to Congress, looking to a reorganization of the work of the department under two general heads: law enforcement and research. It affects the Dairy Division in particular, as this division is very largely interested in and working on problems of an investigational nature.

The plan has not been made public in any official manner but is a matter of general discussion in and near Department circles. The plan of Secretary Meredith calls for a director of investigational work and a studied reclassification of this work to bring it to date; cut out many of the old projects which are being continued, perhaps their usefulness; take up new problems which have arisen in the past few years, especially those growing out of war discoveries and new utilization of agricultural products; and direct and provide means for carrying on the most valuable research work now going forward.

In many ways this feature of Secretary Meredith's plan is of primary importance. It ranks equal at least to the large outline of cost of production work which he proposes. In view of the divided schools of economists as to whether or not cost of production bears any distinct relationship to selling prices, it may be said that some of the work proposed in the reorganization of the research work is even ahead of this more talked of part of his broad general plan.

For example, in the Dairy Division two primary projects are going forward: one, dealing with fundamental facts of animal nutrition in its relationship to milk secretion, for which equipment and facilities are insufficient at this time; the other, a breeding project dealing with an effort to discover the unknown factors in developing and fixing prepotency in transmission of milk production ability in dairy sires, which has already far outgrown the department facilities to carry forward, except with a large amount of volunteer assistance.

Under the new plan it ought to be possible to secure the attention of these two projects which will insure their proper support. Readers of Hoard's Dairyman are already familiar with some of this work and its results. Results, even with the meagre support possible, have already shown far reaching value especially in the nutrition and metabolism studies. All students of breeding know how fixed and definite are the results of certain strains of breeding, and it can safely be said that the effort now under way to study and test, through long lines of breeding experiments, can hardly fail to discover facts and principles of breeding which will be of immense value to the whole animal industry, if not to the human family itself.

The Dairy Division has other investigational work under way which also needs the attention a fully equipped division of investigation would provide. The utilization of skimmilk is one of these, including its work in cheese manufacture, in the production of casein, and more especially in the production of edible albumen. The scarce element in the world today, in usable form, is nitrogen. To save the protein foods which go to waste in skimmilk is a piece of work worth doing.

How large a part of the work of the department is for law enforcement, how little is for investigation, and what a still smaller part is for extension work is much misunderstood. It is apparent that one of the good results of Secretary Meredith's work will be to call general attention to this. Probably 75 per cent of the work of the whole department, much contrary to general impression, even in Congress, is in the enforcement of laws relating to pure foods, meats, dairy products, quarantines against destructive pests, cotton, grain, and other farm products, grading, etc. Segregating this into one division, giving another charge of research, and then giving adequate effort to extension, or the distribution of the knowledge required, through every available means, is a new conception of department organization.

To carry out this, and other forward looking plans, Secretary Meredith is asking Congress for an advance of ten million dollars in the appropriation needed. Part of this is to pay scientific men and executives in this department salaries commensurate with those paid men of equal skill in other employment, part is for the new heads of divisions needed, part is for new work, especially that in cost accounting and cost of production studies. The fate of this well considered plan when it gets into appropriation committee will be watched with interest.

Cottonseed Meal Prices Tumble in Weak Market

Stocks of Feed are Heavy—Demand Continues Light and Prices are Seeking Lower Levels

[Report by U. S. Bureau of Markets.]

The outstanding feature of the feed market during the week ending November 20 was the serious decline in cottonseed meal prices. In the Memphis market 36% meal dropped to $32, while 41% meal was offered at $3 per ton higher. In a few northeastern markets these grades were offered at $41 and $43, respectively, while in New England territory $45 and $47 was asked. Wide variations in prices continue. Soft winter wheat bran is offered at $42 in the Boston and Pittsburgh markets. New York and Philadelphia quote $41 and $45, respectively, and Buffalo dealers are asking $38 for the same commodity.

The demand for wheat mill feeds is not equal to production, which is below normal. Prices of wheat feeds generally held fairly steady, but several markets report that prices are easing off. Mixed feed and bran declined $1.50 per ton on November 20 in the Kansas City market. Canadian offerings of bran in the New York market exert a bearish influence, and spring and hard winter wheat bran continue to be quoted at $40.

Cottonseed Meal Breaks $4

Cottonseed meal and cake—There is no inquiry for cake and the demand for meal is limited. Prices in southern markets broke sharply. No improvement is noted in the export demand and the cottonseed product situation. Several cottonseed meal mills are running full capacity. Production in Texas is about 60%, while Georgia mills are operating 35 to 50%.

Linseed meal—Present stocks at mills are heavy. The demand is light and abnormally small for this season of the year. Chicago dealers report offerings at $51 delivered Chicago by Buffalo mills, their price being $45 f. o. b. Buffalo. Trading during the past week was on the basis of $50 Chicago between dealers. Jobbers continue to undersell mills $1 to $2 per ton.

Hominy feed—The demand for hominy feed has slackened up considerably on account of lower grain prices. The prices asked by mills which are sold up are in a few cases $4 per ton higher than those asked by mills which are anxious sellers. Yellow hominy sold at $31.40 Chicago, and $34 was offered for white hominy in that market. Large manufacturers are quoting pure white hominy around $42 sacked delivered New York. Production is not heavy at present as new corn has not yet started to move in volume.

Gluten Feed Advanced $4

Gluten feed—The demand for gluten feed has been in excess of production, which is estimated to be from 40 to 50% of normal. As a result prices were advanced about $4 per ton by manufacturers. Reports from various markets indicate that stocks in dealers' hands are good. Around $53 is asked in northeastern markets in 100-lb. sacks.

Beet pulp—The movement of sugar beets to factories is heavy. The demand, as for other feedstuffs, was slow. Bids were invited by dealers offering this commodity at special price concessions. New York importers' offers are $49 f. o. b. New York in even-weight sacks. Domestic supplies and importations are good.

Alfalfa meal—Memphis and Kansas City report that alfalfa meal seems to be in such light demand that best offers are no better than the price for the same grade of hay. Southeastern and northeastern markets quote around $40 for No. 1 meal, and No. 2 meal is offered at $7 less.

Reports from the principal hay markets indicate but little change in the hay market situation during the week. The demand everywhere is very limited and dealers and consumers are buying for present needs only, as they consider present market prices too high when compared with grain prices. Producers, however, are selling very little hay as they maintain that current prices do not cover cost of production and transportation. Receipts are generally light.

The alfalfa market has declined slightly because of an insufficient demand to absorb the relatively light receipts. With the price of alfalfa higher than oats, feeders are not inclined to buy the hay freely. Because of the continued decline in feeds, alfalfa mills are buying but little hay for milling.

Prices of prairie hay at Kansas City broke $3 during the week because of greaty increased receipts and a limited demand. Further declines are expected unless receipts become much lighter. The demand for top grades of prairie at Omaha and Minneapolis was good because of the very light receipts. The same condition existed at Chicago where the best southwestern hay brought $24 to $26 per ton or within about $6 of the price of timothy.

Scarcity of Fancy Butter Keeps Market Unchanged

[Report by U. S. Bureau of Markets.]

The short supply of fine butter continues to hold fresh butter markets steady, and prices were practically unchanged during the week ending November 20. At the close, however, a weak undertone was noticeable, and several factors tended to unsettle the market. Among these may be mentioned the heavy unsold stocks of storage butter, the approach of a season of somewhat heavier production, the general lack of confidence as shown by the absence of speculative interest and the disinclination on the part of buyers to take on a single package more of stock than is absolutely necessary to fill current orders.

Foreign Butter Competing Now

For some time Danish butter, both fresh and storage, has not been in favor with the trade at New York. However, this attitude has recently changed and Danish butter was well taken during the week at advancing prices. The prevailing tendency all week was to turn to butter which could be bought at lower prices. Fine butter was so scarce and so high that Danish which could be supplied regularly at prices 6c to 8c below domestic looked attractive. This butter is now seen on all of the four large markets.

New offerings are reported at 51½c to 52½c, duty paid, and some orders have been placed on that basis. One cargo of Danish shipped without refrigeration, but bought under a guarantee to be free from mold is due. A number of cars of New Zealand butter have also reached eastern markets and more is being pressed for sale. Liberal Argentine offerings are reported at New York but the quality is poor and sales difficult even at 40c to 45c.

Daily reports showing good reductions in storage reserve are in contradiction to the poor selling of storage on the open wholesale market. The explanation must be that distributing concerns are working on their own storage stocks if this explanation is correct. The situation would tend to weaken the market now, but might be a source of strength later on when these concerns have to buy again in order to supply their trade. Reports are current that poorer grades of storage butter have been selling actively on the Boston market at heavy losses, but that there is a firm tone on the better grades and no price cutting. There has also been some movement of undergrade storage at low prices on the New York market. Demand for quality offerings of storage is better.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending November 20 and the corresponding week last year were as follows:

	Week ending Nov. 20 1920	1919
	Cts.	Cts.
New York	65.0	72.2
Chicago	60.8	70.9
Philadelphia	65.2	71.6
Boston	61.0	69.8
San Francisco	54.4	64.3

The receipts of butter at these markets for the week were 6,001,680 lbs. as compared with 7,881,943 lbs. a year ago and 6,061,500 lbs. for last week.

Texas Calf Club Formed

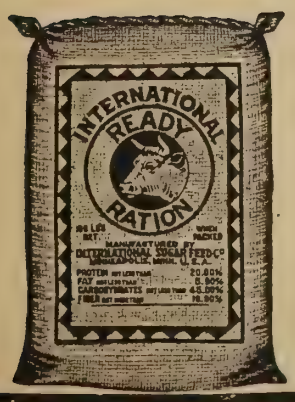
Breeders of Holstein cattle in Tom Green County, Texas, recently completed the organization of a Holstein Calf Club. Their purpose is to stimulate interest among cattlemen in that section for stocking their ranges with registered dairy cattle. The directors elected for the Club will serve as agents in securing calves for the organization. The members of the Club subscribe for calves for their children. A calf show and sale will be held at the end of the year.

Christmas, in the country of all places, should be a community holiday. It's too big a thing to be kept all within your family.

GET GREATER Feeding Results *from* Home Grown Grains

YOU have had a bumper grain crop. You naturally expect to depend upon it to a considerable degree as a winter milk producer. In this you are right. But bear in mind that grains alone do not provide a *balanced* ration for maximum milk production. Supplement them with *proper* concentrates and you'll arrive at the ideal milk-making ration. Here are two proven, guaranteed feeds with which to balance your grains.

International Special Dairy *and* International Ready Ration



These feeds differ in protein content. Choose between them according to your requirements. Both of these feeds are covered by the broadest guarantees known to feeding men. Use these feeds with fodder corn, corn meal, gluten meal or as a straight ration with hay and silage. Your cows require the molasses and concentrates which these feeds contain. Get the proof in your milk pail.

Here Is the Guarantee—Read It!

We guarantee International Special Dairy and International Ready Ration to produce more milk than can be obtained from any other feeds or mixtures of similar analysis.

Feed International Special Dairy or International Ready Ration in accordance with directions and you can increase the milk production of any cow in your herd from 50 to 100 gallons during a 6 months' period as compared to results from using any other feeds of similar analysis. We guarantee this result as you can mail us comparative records and we will mail you check to fully cover guarantee increase.

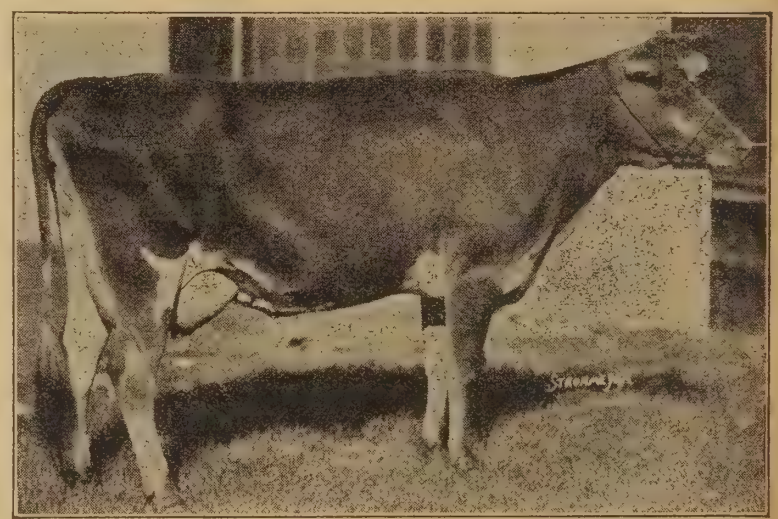
513 Brunner Street, Peru, Illinois

Jerseys Strong at Georgia Fair

The dairy cattle show held at the Georgia State Fair October 28th to November 6th was the best in its history. W. H. Howell, Georgia, acted as judge. There were 164 well fitted, good individuals exhibited, the Jerseys leading with 104 animals. Only 11 more head of Jerseys were at the 1920 National Dairy Show. The quality was as good as the numbers. Diggs Farm, North Carolina, won all the championships and many of the firsts. Raleigh's Farmer's Glory, 2-year-old shown by Diggs Farm, was the sensation of the show. He was made senior and grand champion. During 1918 and 1919 he was not defeated in class, winning every junior championship and all grand championships except one. This year he has shown at Richmond, Raleigh, and Columbia, and has been senior and grand champion each time.



Rockdale Farm, Georgia, won first place in the aged cow class with Fairy Boy's Houssie 2nd. There were eighteen cows in the class. Several at the ringside wanted to see a very typy cow owned by Diggs Farm looked better every day. It stood high in the get of sire and produce of cow classes.

To the Georgia Jersey Cattle Club goes the credit for this Jersey show. Members exhibited ninety head. Mr. Harry C. Robert, secretary of the fair, told the Jersey breeders he would give them an entire building if they would fill it.

Two herds of Guernseys, totaling 30 head, were out. Killarney Farm, Indiana, had 14 good head and won all the championships. The interest in Guernseys in Georgia is growing. They are making good. Dr. Wm. Rawlings, Georgia, showed 16 head. Several of his animals were excellent but had not been well enough conditioned to win first place in closest classes. They will be strong next year, as they have some straight, typy youngsters.

Four herds of Ayrshires, 30 head, composed the best show ever held in Georgia. J. E. Burtis, New Jersey, won the senior and grand championship prizes with his bull, Stanley Howie, and junior championship with Iriquois Victor Hugo, a well grown, breedy, toppy, milky looking bull.

Rena Knox of Glimmer Glenn, owned by Burtis, won senior and

FAIRY BOY'S HOUSSIE 2D, OWNED BY R. S. TIPPIN, GEORGIA

placed first. Lack of size and a defective udder placed her lower.

There were four entries in the aged bull class, a better one than at the National. Tippin won first with Fairy Prince Raleigh, a bull of excellent breeding and wonderful quality. Mr. J. H. Hooks of Georgia stood second with Blue Fox of Warthen, a good son of Blue Fox's Eminent Junior, bred by J. A. Shanklin, South Carolina.

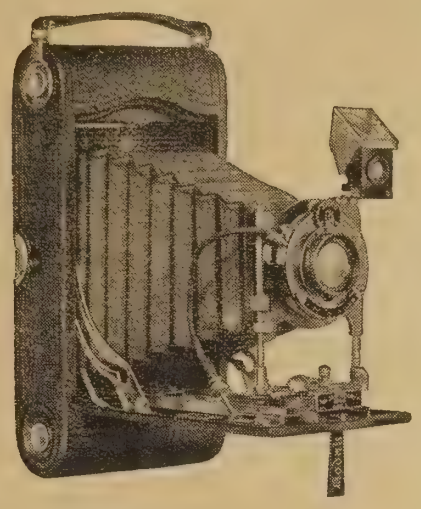
Meadow Crest Farm, Georgia, made another start in the show ring after a vacation of several years. In Atlanta and here the herd won well and grand champion honors. She is a living example of dairy temperament. Her top line is perfect, barrel ample, and mammary system well developed. R. A. Kinard of South Carolina won the junior and grand champion female prize on an excellent eighteen-month heifer just fresh. She was straight of back, deep of body, and carried the most typical Ayrshire udder of the show. Her tail setting was a little too high and her pin bones too low for a perfect score. She would have won by a larger margin if she had been better fitted.

Georgia. W. H. HOWELL.

Valuing Skimmilk

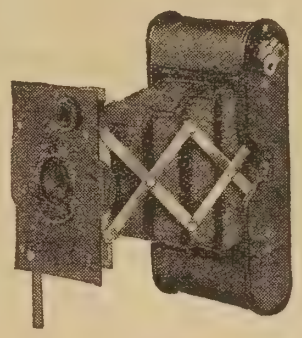
Farmers who are wondering what is the feeding value of skimmilk, will be interested in the rules which are approved by the animal husbandry men at the state college of agriculture at Ithaca, N. Y. One rule, known as Gurler's, is that a hundred pounds of skimmilk are worth, for making pork, one-half the price of a bushel of corn.

Hoard's rule, however, is better, think the college workers; it is: When fed alone, the value of a hundred pounds of skimmilk equals the market price of live hogs in cents per pound, multiplied by five. If fed in combination with corn or barley, it is worth the price multiplied by six instead of by five.



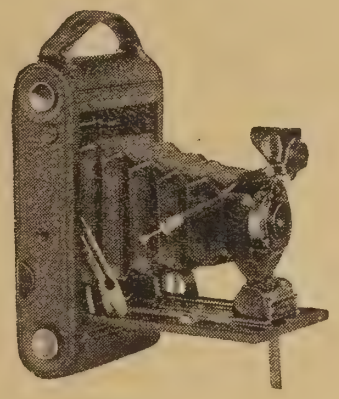
The following example shows how the rule works: If hogs are worth fourteen cents a pound, a hundred pounds of skimmilk would be worth for feeding fourteen cents times five, or seventy cents, if fed alone. If fed with corn or barley, as it usually is, it would be worth eighty-four cents.

A limited amount of skimmilk for feeding small pigs or brood sows is worth much more to the hundred pounds.

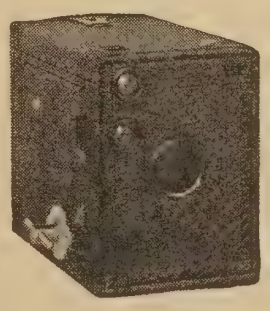


The larger the percentage that milk makes of the total feed, and the older the hogs, the less the milk is worth. The above rule is for pork production in general.—New York College of Agriculture.

Uncle Ab says: The man who knows what he needs and how to make it can do more with a jack-knife than an ignorant chap can do with a whole kit o' tools.



Among the Christmas Gifts



For the grown-ups or the nearly grown-ups, a Kodak for pictures of the post card size, 3¼ x 5½ inches. It is familiarly known to hundreds of thousands of enthusiasts as the "3A". It makes the largest picture available in "pocket photography". The 3A will really go into the side pocket of almost any coat. Frankly, however, it is more conveniently carried in an overcoat pocket—or slung over the shoulder in a case. Excise war tax and all, the Junior model, with a fine Rapid Rectilinear lens, sells at $24.64—and with the Kodak Anastigmat *f*.7.7 lens, at $30.62. There are other more expensive models—all have the Kodak simplicity—and they all make good pictures.

A gift for the one who already has a larger Kodak—the Vest Pocket. You don't carry a Vest Pocket Kodak—you wear it, like a watch. It is always ready to picture the unexpected and the unusual. The price, including the excise war tax, is $9.49.

For the boy or girl in high school—the No. 1 Kodak Junior. There's always room for it in the pocket, and the Kodak story of the school days is one that not only gives fun in the making but in its album form becomes a permanent delight to the whole family. The price of the No. 1 Autographic Kodak Junior is $16.67, including the excise war tax.

For the little folks—a No. 0 Brownie. These little cameras have good lenses and shutters and finders, and use the same film and make the same size pictures as the Vest Pocket Kodak. You will be astonished by the good work they do; you will be even more astonished at the intelligent way in which a youngster of seven or eight will go about picture-making with a No. 0 Brownie. The price, including war tax, is $2.86.

This page gives only a hint of the Kodak and Brownie line—there are Brownies for pictures of every size that Kodaks make, and there are Kodaks with high speed shutters and rapid lenses—there are folding Brownies as well as box Brownies—but they all have one common characteristic—they make good pictures. And all Kodaks (except Stereo and Panoram) and all *folding* Brownies have something else in common—they are Autographic, and when used with Autographic film provide for the instant titling of every negative at the time it is made. And the Autographic costs no more than other film.

American Farm Bureau Federation Convention

"The most important agricultural event of the year," is the expression freely used in referring to the coming convention of the American Farm Bureau Federation to be held at Indianapolis, December 6, 7, and 9. Not only will this convention be a summing-up and inventory of the first year's work of an organization that has sprung into existence and passed the million mark in the short space of less than twelve months, but it will be made the occasion for the determination of policies and principles which will have a far reaching effect in both a legislative and economic way. This great organization is now generally recognized as the logical group to take the lead in formulating policies and principles on all subjects affecting agriculture. For this reason congressmen and business interests, as well as farmers, will watch the deliberations of this convention with unusual interest. The final formulation of the organization's statement of a national agricultural policy will be completed for presentation at the convention.

Monday afternoon will be given to discussion of rail, water, and highway transportation in their relation to the farmer. Henry Sherley, secretary of the Federal Highway Council, will discuss the Townsend Highway Bill and the present Federal Aid plan of road building.

Clifford Thorne will discuss certain features of railroad transportation. He will speak of the "Pittsburg Plus" case which was recently before the Federal Trade Commission.

Governor W. L. Harding of Iowa and Charles P. Craig of Duluth will have much to say of the advantages to be derived from the development of a deep waterway from the Great Lakes to the sea.

The question of finance and credit will be treated from two angles. W. P. G. Harding, governor of the Federal Reserve Board, will explain the functions of the Reserve System. A. L. Lever, father of the Smith-Lever Act, and now a member of the Federal Farm Loan Board, will discuss Rural Credits. Henry C. Wallace, editor of Wallace's Farmer, will speak Tuesday morning on "Fundamentals of Co-operative Marketing". Milo D. Campbell, president of the Michigan Milk Producers' Association, will also discuss certain features of co-operative marketing.

H. C. McKenzie of New York is chairman of the A. F. B. F. committee on taxation and has been making a careful study of the proposed repeal of existing corporation profits taxes. His address should prove interesting and highly instructive.

Gray Silver, Washington representative of the A. F. B. F., will speak on the subject, "The Washington Office and the Man Back Home". Sir Auckland Geddes, the British Ambassador, will discuss in his interesting way some of the world-wide phases of the agricultural problem.

A large share of the third day will be given over to discussion of the various angles of organization, based upon the experiences of the past year.

Ayrshire Breeders in Boston

The annual meeting of the New England Ayrshire Club will be held at the Quincy House, Boston, Tuesday, December 7th. Officers for 1921 will be elected and action will be taken on the report on by-laws. A banquet will be called at 12:30 o'clock.

When writing advertisers please mention Hoard's Dairyman.

Watertown, Wis., Semi-annual Holstein Sale

The Watertown Holstein Sales Company's eleventh semi-annual sale held November 23 at Watertown, Wis., included 93 animals that brought a total of $22,825, not a high figure, but a fair one.

Commander Harris of the Naval Academy Dairy in Maryland, Giltner Bros. of Kentucky, and Golden & Muehl of Wisconsin were the heaviest buyers. Among the Maryland purchases was Duke Matador Piebe, top price animal of the sale that brought $800, a grandson of Matador Segis Walker from a 24-lb. dam now on year test. He was consigned by the Carnation Stock Farms.

Mack, Haeger, and Cook did the selling with S. T. Wood in the box.

All animals selling for $300 or more and buyers are listed below:

Wis. Masonic Home Farm, Wisconsin	
Wisconsin Bess Gewina	$325
Segis Whitney Korndyke	500
Reuter Murray Nitt	475
Pleasant Posch Bonheur Star	625
Pleasant Bonheur Champion Star	550
Warner Heitz, Wisconsin	
Aaggie Greene Korndyke De Kol	$375
Naval Academy Dairy, Maryland	
Bessie Homestead Paul De Kol	$350

C. B. Smith, Kentucky	
Harvest Sir Ormsby	$500
Golden & Muehl, Wisconsin	
No. 102	$340

Walworth County Holstein Sale

The Walworth County Holstein breeders' sale held at Elkhorn, Wis., November 15, was as successful a sale as any we have attended this fall, 54 head selling for $12,380. This is not a particularly high figure but it represents good, fair prices for the animals consigned.

Walcowis Farms topped the sale at $700 on Miss Walcowis Pontiac Netherland, a 16-lb. 2-year-old granddaughter of King of the Pontiacs. She is a splendid bodied heifer and, given a well balanced udder, would be among the tops in any national ring.

Mack, Beaumont, and Wiswell did the selling with J. G. Voss in the box.

Following is a list of all animals selling for $250 or more and buyers:

Fred Kindert & Son, Wisconsin	
Miss Ormsby Burke Perfection	$275
W. C. Van Pappelendam, Illinois	
Miss Walcowis Pontiac Netherland	$700
R. Minghall, Wisconsin	
Sir Ollie Ormsby Korndyke	$520
E. E. Canniff, Wisconsin	
Kayewood Queen Pontiac	$400
Harry Ellsworth, Wisconsin	
Kayewood Tessie Johanna	$355
R. E. Kimpel & Son, Wisconsin	
Ellsdale Beauty Colantha	$385
Bessie Viola De Kol	310
Rollingdale Model Bottels	260
H. M. Purinton, Wisconsin	
Lilith Pet De Kol Beauty	$250
M. J. O'Connor, Wisconsin	
Johanna Colantha Gracie	$330
B. C. Harter, Wisconsin	
Lady Rose Homestead De Kol	$305
Belle Longfield Kayewood	415
Lane J. Curtis, Wisconsin

John Morrissy, Wisconsin	
Aaggie Orleans Pietertje	$255

New York Butter Market

NEW YORK CITY, NOVEMBER 23:—The arrival of several shipments of foreign butter is causing a temporary slump in the butter market at the present time. There have been no price declines as yet but the market is weaker than it has been for several days. Last week about 7,500 packages, principally casks, of Danish butter were unloaded. A like quantity are nearing port at the present time but that is unlikely to be ready for distribution before Saturday as the boats are being held back because of unfavorable winds. Two cars of boxed Canadian butter arrived yesterday, and more is expected. One car of New Zealand butter in boxes was due to arrive from the West Coast yesterday. While the quantity of foreign butter is not sufficient to cause more than a flurry in the market under ordinary condition, receivers and jobbers are very nervous and are quickly influenced by reports of foreign arrivals and proposed shipments.

One feature in the market stands out rather prominently this week and that is the quickened demand for fresh make, Danish butter. Practically all such butter has been absorbed during the past few days. There is a very good reason for that in that the butter is of uniformly good quality and is selling in wholesale lots at prices from seven to eleven cents below the quotation on domestic extras. There has been prejudice against Danish butter for some time for the reason that it is packed in casks which makes it harder to handle than tubbed butter. The difference in price is apparently helping to reduce that prejudice. There is good reason for the prejudice as jobbers must saw the casks in two in order to print the butter and in some cases it must be repacked in tubs in order to dispose of it in bulk. The two operations necessarily entail some loss and the labor cost is an item that must be considered.

The market, aside from the weakened condition, has changed very little from last week. Strong demand is only for strictly fancy butter. However, there is more inquiry than usual for butter that will score 90—91 points. For other classes, demand is absolutely lacking. During the greater part of last week, there was a marked scarcity of high grade butter but by piecing out their supplies receivers were able to satisfy the trade. At the present time, more fancy butter is arriving, which is responsible, to some degree, for the weakened condition that prevails at present. It is not anticipated that there will be any material break in prices in the immediate future although a slight decline may materialize. Established quotations at the close today were as follows: Extras (92 score), 65c; higher scoring than extras (93 score or higher), 65½@66c; firsts (90—91 score), 55@63c; firsts (88—89 score), 49@53c; and seconds (83—87 score), 41@47c.

There is a marked tendency at present for retailers to turn to storage butter. Fancy storage butter is quoted 6½@7c under corresponding prices of fresh butter, and, as much of the butter that went into storages in June is of excellent quality, it is in strong demand. Holders of storage butter are anxious to sell as they do not anticipate further advances in butter prices. W. B. LIVERANCE.

What the Dairymen Say

SLY PUSS P.

Grand Champion Jersey Cow, 1920 National Dairy Show. Owned by Longview Farm, Lee's Summit, Mo. Read their letter below:

BARCLAY'S NIGHTINGALE

Grand Champion Ayrshire Cow, 1920 National Dairy Show. Owned by Adam Seitz, Waukesha, Wis. Read his letter below:

Her Owners Clip to Keep Bacteria Count Down

LONGVIEW FARM

Lee's Summit, Mo., Oct. 17, 1919.

We keep the tail, udders and hindquarters of all our cows in milk clipped, for the reason that we produce certified milk, and find we can **keep the bacteria count down** by following this method. Of course the same thing would apply even if one were producing ordinary commercial milk.

C. J. TUCKER, Gen. Mgr.

Used on His Milking Cows to Keep Them Clean

SPRING CITY STOCK FARM

Waukesha, Wis., Oct. 29, 1920.

In the dairy we always clip the milking cows around the udders, underneath the bellies and up the flank in order to keep them cleaner. It is the easiest way doing it, and saves lots of valuable time.

We surely have had good service out of the Stewart Clipping Machine.

ADAM SEITZ.

Regular Clipping Is the Order of the Day

These letters are typical of scores received from large cattle breeders and dairymen all over the United States and Canada. These men clip their cows on udder and flanks regularly every few weeks—the parts are quickly cleaned before milking, and no filth drops into the pail.

Compulsory in many sections in production of certified milk—very desirable for ordinary commercial milk.

Clip with the Stewart No. 1—for years the world's standard clipping machine. Sturdily built, easily operated. Clips horses and mules also. Complete, $14 at your dealer's, or send $2 and pay balance on arrival.

Electric clipping machine, 110 volts A. C., $80.

HOARDS DAIRYMAN JUNIORS

Every One a Prize Winner in the Largest Junior Live Stock Show Ever Staged in Wisconsin

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. _____ State _____ R.—

Junior Letters

Hoard's Dairyman Juniors:—I have been busy going to school. My school began Aug. 16.

We are now milking nine cows. One is dry.

Tennessee had its share of rain during August. The rain broke the weather record.

We have raised five nice heifers. We also have a new male. He is surely a beauty.

Papa is road commissioner of the 12th district and many improvements are being made on the roads. Among the improvements is a fine grade being built between Rockford and Wildwood and goes near our place. There is also a public road being built through our place to the grade which is almost built.

Papa is away filling silos and will return the last of this week or the first of next week to fill ours.

We are going to have a pie supper at our school soon and the money will be used to make some improvements. Our school organized a literary society Sept. 13th with Mayme Glover president; Johnnie Shope, vice-president; Mac White, secretary; Dicie Bohanan, critic; and three program committees as follows: Elsie White, Neva Wolfe, and I. We had our first program Sept. 24.

I received my grade card for the first month. My best average was 100 on geography, which I like best of all my studies. I have eight studies in all. I am in the 6th grade.

I wish good luck to all of the juniors.

Tennessee. Hazel Trent.

Hoard's Dairyman Juniors:—I have been in the state clubs of Colorado for two years. This year I was sent to the Colorado State Fair to judge stock. I took ninth place for my county. I would have gotten a better rank than 83 per cent if I had been on time. I was cut fifteen minutes short from the ring of Duroc hogs.

I can give feed rations and judge stock. Last year I took third place in the two things just mentioned.

This year we are going to feed cattle. We live only one mile from the city and a quarter of a mile from the American Beet Sugar Co. We haul the beet pulp fresh from the factory each day.

This year we have had a good crop of corn. We planted twenty-two acres. It averaged about ninety bushels to the acre. We filled our new silo and the silage sure helps in feeding cattle. I will remain a booster of the club and try to get new members.

Colorado. Harold Dick.

Hoard's Dairyman Juniors:—I live on a farm of 60 acres. We have 13 head of cattle, 8 head of horses and colts, all the way from 45 to 75 pigs and hogs, 95 to 125 chickens, 4 rabbits, 1 dog, 2 cats, 8 to 12 geese, and 30 guinea pigs. I have 3 guinea pigs. My sister, Marion, 16 years old, also has a guinea pig and my little sister, Engenie, has 3 guinea pigs. My sister, Eva, two years older than Marion, has 23 guinea pigs. Eva also has 3 rabbits and Marion 1 rabbit. I have two cats. Their names are Bob and Jeff.

I am in the fourth grade and nine years old. Our hogs and pigs are big type Poland-Chinas. Our chickens are Barred Rocks. Our rabbits are New Zealands. Our dog is a Scotch Collie. Her name is Dach. Our geese are Embden and our guinea pigs are English.

Well I will close wishing some junior boys and girls would write to me. My address is R. 2, Union, Iowa. Addie Curless.

Hoard's Dairyman Juniors:—I am ten years old and in the fifth grade.

I have a Holstein cow that freshened this spring at the age of 17 months.

I also have a pig that my father gave me.

My father has 4 horses and 19 head of cattle.

I live on an 80-acre farm about 2½ miles from two small villages.

We filled our silo about two weeks ago with our own engine and cutter.

I would like to hear from some of the juniors. My address is R. 3, Baldwin, Wisconsin.

Harry Vruwink.

Hoard's Dariyman Juniors:—I received your fob, button, and creed. Thank you very much.

I am in the 7th grade. I am 11 years old.

I have a heifer. Her name is Blue Bird. I live on a farm of 88 acres. I tried to raise chickens but my luck was not good. We are milking 10 cows. We have all of our corn shocked; our oats went 35 bushels to the acre. I have a field of popcorn which is pretty good. I had good luck in pumpkins. I sold 75 of them. We are going to dig potatoes now.

I hope to hear from some of the juniors. My address is R. 1, Box 2, Pine Island, Minn.

Harold West.

Hoard's Dairyman Juniors:—I live on a 400-acre farm. We are milking a dairy of 25 cows. I am raising 5 calves and I have a Holstein heifer 2 years old. We have 6 horses and 5 hogs. My brother has a carload of apples or more on his farm. The wind destroyed many limbs on the apple trees.

I like to go coon hunting. We have a coon dog named "Bun".

Wishing the juniors much luck and also wish they would write to me.

My address is R. D., Falls Village, Conn.

Charles W. Hurlburt.

Hoard's Dairyman Juniors:—I received the fob, button, and creed and was very much pleased with them.

I feed my rabbit kale, cabbage, and rolled oats. She has little ones now. I haven't touched them yet because the mother will kill them.

I have a cow. We feed her butterfat and ground oats and Fishers' Dairy Feed or mixed. I have 28 chickens. They are White Leghorns. They are a little bigger than crows. I feed them wheat and seeds from the threshing machine.

Well, I guess I better close for this time. I wish some of the juniors would write to me. My address is R. A, Box 686, Portland, Ore.

Henry W. Meyer.

Hoard's Dairyman Juniors:—I am 13 years od and live on an 80-acre farm. We have 14 milk cows and three young heifers and one young bull. We have four acres of beets to work ourselves.

Wisconsin. Aaron Klug.

Hoard's Dairyman Juniors:—I have not written for some time, I have been so busy with my school work and the work at home.

I sold my pigs and my dad said he would give me a calf. My heifer is about 20 months old. She will be fresh about Christmas, then I will have 3 calves.

I am fourteen years old and am a freshman in high school.

If any of the juniors want to write to me my address is 503 East Foster Ave., State College, Pa. Frederick Markle.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I am doing eighth grade work this winter at school which opened Aug. 30. I am 13 years old. We have seven cows and are milking five of them. We sell two gallons of cream and five gallons of milk per day. We raised eighty bushels of wheat this year on four acres of ground. We live on a 130-acre farm.

We have a concrete road 9 ft. wide running through our place. It should be 14 ft. as it is not wide enough. We have a concrete block house and barn. They certainly are fine. We live two miles from town. We have a car. I do the driving.

West Virginia. Wendell H. Ferrebee.

Hoard's Dairyman Juniors:—I am a girl 13 years old and am in the 6th grade. I go to a public school and my teacher's name is Miss Nona Martin. I have not lived in Michigan very long but I like it fine. We bought a 160-acre farm here. There are 15 acres of timberland and a large lake on the place. We have a team of thoroughbred mares and about 20 chickens.

I have four sisters and four brothers. The smallest girls are twins and are two years old.

Michigan. Mary James.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I am 11 years old and in the 7th grade. I live on an 83-acre farm. I help my father. My brother and I have a sow. We keep 4 horses and 15 cows. My mother raises chickens. My father has started to plow for wheat. We had 8 acres of wheat and 160 bus. We had 3 acres of rye and 60 bus. and not quite 4 acres of oats and 238 bus.

Pennsylvania. Wallace Stouff.

Hoard's Dairyman Juniors:—I live on a farm of 134 acres. We keep registered Holstein cattle. We have many pets, some are rabbits. One is brown and white and the other ones are Belgian hares. Our pony's name is Maygo. Our pet lambs' names are Billy and Dolly.

My sister Frances and I raise ducks, but never have very good luck for they nearly always get killed by the horses.

We go to high school in Minerva. We have very good times at school. We are learning many yells for when we play games with other schools we want to make lots of noise.

We only had 100 bushels of wheat and 664 bushels of oats. We had the best wheat crop in our neighborhood. Some of the people only had five bushels of wheat.

Wishing good luck to the juniors.

I will tell you my address so some of the juniors can write to me. It is R. F. D. No. 2, Minerva, Ohio. Vesta Blazer.

Hoard's Dairyman Juniors:—This is my first letter to the club. I received my badge three days ago and think it fine, also my creed and fob. I am going to memorize the creed as I think it is very true.

I won the silver cup for my calf and also second and third prizes for my Shetland pony. My calf's name is 'Ginger" and the pony's name is "Tony".

British Columbia. Robert Hornby.

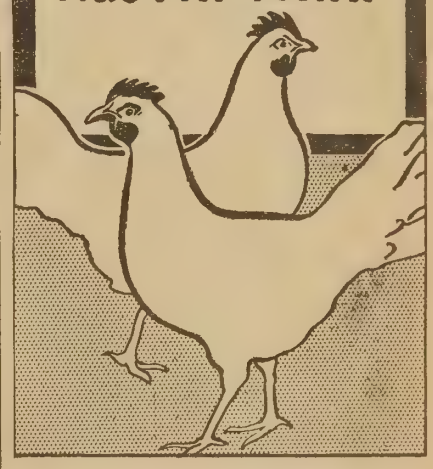
Hoard's Dairyman Juniors:—I feed my pet pigs. Their names are Harry, Dick, and Sally. We have four ponies and one colt and one driving horse. My brother and I take care of eleven young bulls, three cows, and we get up in the morning at five o'clock and take care of the stock before we go to school. We live on a 1,700-acre farm and most of it is hilly. We live in a bungalow. I am in the 6th grade and I am thirteen years old. I hope some of the juniors will write to me. I will give my address: R. R. 6, Box 54.

Martinsville, Ind. George Groenert.

S.C. White Leghorns

Early Maturity
OAK DALE BIRDS

Are noted for laying early in life. Frequently early-hatched pullets lay at five months of age and they lay well throughout the winter and summer months.



Many records of more than two hundred eggs per year from single birds are known.

The eggs are noted for their uniform size and pure whiteness.

Every OAK DALE (WHITE LEGHORNS) carries the blood of great winners.

Write for our Free Catalogue Dept. R-3.

Great Chance, men. Good land, easy terms, free list. BAKER A 76, St. Croix Falls, Wis. 7-spl.

Where dairy farming is profitable—There are localities in the South where, on account of the rapid development of industrial cities and towns, supplies of dairy products are short and prices are high. In these same localities long grazing seasons and winter cover crops cut down feeding costs and all conditions are exceptionally favorable for profitable dairy farming. Good improved farms can be bought at prices much lower than are asked for similar lands in other parts of the United States. Buy a Southern dairy farm now while prices are still low, make money and build up a valuable property. Forr full infromation write to J. C. WILLIAMS, Manager, Southern Railway Development Service, 1302 Pennsylvania Avenue, Washington, D. C. 14-spl.

Westerners are here, more coming! There's a reason. Investigate! NEW YORK FARM AGENCY, Westfield, N. Y. 20-spl

Bradford County, Pennsylvania, "Bull Reception" Success

November 5th, on the farm of W. F. Bohlayer, Bradford County, Pennsylvania, there was staged what is believed to be the first official "Bull Reception" ever held in the United States. This aristocratic social fete was arranged by the eighteen members of the Troy-Canton Co-operative Holstein Bull Association. For this event breeders of pure-bred cattle throughout Bradford County and neighboring territory were invited to extend greetings to the four newly purchased pure-bred Holstein bulls recently secured by the association from Pinery Farms, Ohio.

The main feature of the "Reception" was a friendly greeting by each of the visitors to the new bovine aristocrats after which H. C. Gates, president of the association, gave a detailed description by charts of the remarkable line breeding shown in the pedigrees of these valuable young sires. Following Mr. Gates' remarks Mr. R. R. Welch, in charge of dairy husbandry extension of State College, gave a very excellent talk on dairy cattle improvement throughout the state. In his remarks he pointed out the very distinct advantages of co-operative bull association work.

A "mock sale" was then held with County Agent D. K. Sloan as auctioneer. Terms of the sale were that the visitors were to bid what value they would be willing to pay for these bulls on the market. The result showed a nice profit from the actual cost of the bulls, a fact which was particularly appreciated by the owners. All through the proceedings sweet cider and pretzels were freely consumed.

The four bulls now owned by this association were purchased in March from Pinery Farms, Ohio, with the understanding that they were to be retained at Pinery Farms until six months of age, when they were to be tested for tuberculosis and shipped with the privilege of a 60-day retest. All are sired by the noted King Hollingen Fayne Valdessa out of the world's record three-year-old cow, Finderne Hollingen Fayne. These bulls have been named using the prefix "Brad Co. Hollingen". One is from a dam with a two-year-old record of 10,000 lbs. milk, 420 lbs. fat, and whose dam made 985.6 lbs. fat in a year; the dam of one has a four-year-old record of 864 lbs. fat; one is from a dam whose six months' production with her first calf was 323.2 lbs. fat and whose dam made 1,057.6 lbs. fat in a year; and the fourth is from a two-year-old which has made 268 lbs. fat in 4 months and whose dam made 840 lbs. fat in a year.

These four bulls represent the best combination of Holstein blood that has ever been brought into Bradford County where there are over 150 active breeders of pure-bred Holsteins. In this association every member has had at least one test according to the accredited herd plan for the control of tuberculosis. All money due the association has been paid and a surplus for operaton is in the treasury.

The four bulls, after being kept in quarantine for 60 days, will be distributed to their respective blocks where they will be used, in accordance with the by-laws, by the members in proportion to their interest in the organization. The fortunate feature is that the owners of these bulls live very close together, thus making it possible for them to meet often and it is their present plan to hold consignment sales, offering individuals rich in the blood of the four bulls described above. They are now planning for the organization of a testing association for the purpose of conducting long and short time records.

Pennsylvania. D. W. SLOAN.

Waukesha Guernseys Average $545

Forty-four animals sold for an average of $545; two females sold for $1,000 or more, and a bull for $10,500 is in brief the story of the Waukesha County Guernsey Breeders' Association semi-annual sale held at Waukesha, Wis., November 17.

Geo. W. Broune topped the sale with a 16-month-old bull calf that was purchased by Wm. M. Jones & Son for $10,500, the highest price ever paid for a bull at public sale in Wisconsin. The calf is a son of Rex of Rich Neck from Marietta of Maple Hill (797.7 lbs. fat in Class A), a daughter of Langwater Hayes Rosie's King of the May. Fruit Bros. were the last contending bidders.

Geo. D. Lawson purchased the highest priced female, Beauty of Lynnhurst, for $1,005. She is a granddaughter of Galaxy's Sequel with 572.88 lbs. fat in Class A, and was consigned by F. E. Fox.

Fruit Bros.' Sweet Alice's Rival of Maple Heights, a 4-year-old daughter of Langwater Hayes Rosie's King of the May, with 549 lbs. fat as a 3-year-old, was the only other female to reach the $1,000 mark. She was purchased by Frank E. Swan, Wisconsin.

The following list includes those animals selling for $300 or more and the buyers:

Geo. W. Broune, Florida	
May Bird of Edgemoor	$410
Lakeshore's Countess	400
Lily Rose of Maple Hill	710
E. H. Mozey, Wisconsin	
Sella Daisy of Walnut Ridge	$420
Lady Tricksey of Tillyharden	330
W. A. Cook, Wisconsin	
Maternachene of Utility	$555
Belva of Aurelian Farm	560
Hilaria	495
Shoreland Lily	595
Wm. Jones & Son, Wisconsin	
Sweetheart of Maple Hill	$535
Rex of Broad Ripple	10,500
Geo. D. Lawson, Wisconsin	
Beauty of Lynnhurst	$1,005
Frank E. Swan, Wisconsin	
Sweet Alice's Rival of Maple Heights	$1,000
F. E. Fox, Wisconsin	
Sunnybrook Mignonette	$850
R. R. Schwartz, Wisconsin	
Tilden Farms Aarabella	$410
Frank W. Eighmy, Wisconsin	
Yeksa's Penelope of Echo Glade	$315
Dave Owen, Wisconsin	
Ultra's Dora	$300

Missouri Dairy Cow Race

Pure-bred dairy cattle breeders of Missouri are considering starting official testing in their herds and thereby entering the Missouri Dairy Cow Competition, or state-wide cow race for a number of valuable prizes both in the yearly classes and for highest productions of fat during each month.

The contest is open to all pure-bred cows in the state. Cows may start test at any time and the regular monthly official test will be made. In order not to place young animals at a handicap, records made by cows under two and a half years old at the beginning of the test shall be increased by 30%; senior 2-year-olds by 24%; junior 3-year-olds by 18%; senior 3-year-olds by 15%; junior 4-year-olds by 8%; and senior 4-year-olds by 5%. Prizes will be awarded on this basis. Breeders wishing complete information and prize list should write Chas. W. Turner, Supt. of Official Testing, Dept. of Dairy Husbandry, Columbia, Mo.

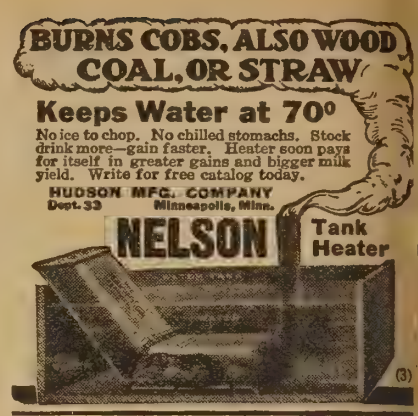
Missouri Holstein Association

On October 23rd, Mr. E. J. Alexander of Monroe City, Missouri, began work as field man for the Missouri State Holstein Association. He has already placed a car of fine grades in Johnson County. On October 23rd he met with the breeders at Versailles, Missouri, and organized the Benton County Holstein Club with fifty members. The members of this club already own a goodly number of pure-

E. J. ALEXANDER



breds and a few grades and are preparing to bring in one or two car loads additional in a few months. Mr. Alexander is also working on a consignment sale to be held in November or early December.

The Association was fortunate in getting a man like Mr. Alexander. He has been a breeder of pure-bred Holsteins for several years. He organized one of the first Holstein calf and cow clubs in this state in his home county a few years ago. Last spring he was employed by this State Association to build up the membership of the Association. He was so successful in this work and met with the approval of the breeders to such an extent that he was considered the logical man for a fieldman.

The Missouri Plan

At the annual meeting of the members last January the President proposed that a membership campaign be inaugurated to finance a fieldman. It was proposed to charge a dollar a year for pure-breds and twenty-five cents a year for grades, each breeder signing up for three years and giving three checks. This plan was adopted. The question then arose as to how the membership could be reached as they were so widely scattered over Missouri. It was proposed to establish an honorary membership of $100 each for a three-year period, among the creamery men and milk companies and allied industries of the state, this money to be used in the membership canvass. The companies responded quite generously and Mr. Alexander as mentioned above was employed to put on the canvass. He went from breeder to breeder throughout Missouri and only four or five of the breed-

ers seen refused to take membership. The average annual dues under the plan is about eleven dollars. While the canvass is not yet entirely finished the board felt justified in starting this fieldman to work.

Missouri was the first state to adopt this plan of membership and Mr. Pollock of the National Association said at the Missouri Sale Banquet last spring that he considered it the best plan he had seen so far. He later recommended it to New Jersey and New England breeders and they adopted it. It is certainly equitable. If a man has a large herd he is able to pay more dues and will get more benefits from the association.

The most important work for the Missouri fieldman will be to get more Holsteins into the state. There is a big demand for them here and as most of this demand comes from beginners they need assistance in buying good healthy cattle. In some counties the sentiment has not yet crystalized and he will organize the counties for Holsteins. There are three very definite pieces of work he will attempt, of those he will write later.

The State Association will hold its next annual meeting in January at Columbia at which time it will be addressed by Senator Hackney of Minnesota. Its next state sale will be May 23-24, place undecided as yet.—Missouri Holstein Association.

Dusting and Dairying

HOARD'S DAIRYMAN: — Dairymen, above all other farmers, should be interested in dusting their trees instead of spraying. At least, that is the conclusion I am forced to draw after talking with dairymen in the East and Middle West. Nearly every dairyman has an orchard, either large or small.

"But why dusting instead of spraying?" you ask. Because dusting takes less time. And if any dairyman has time to spare, I have never heard of him.

Besides being a quicker method than spraying, dusting has other advantages that will win favor with dairymen. Dusting is not so disagreeable as spraying, and the work is not so hard. The labor of mixing materials is reduced, even done away with entirely. There is no heavy tank of liquid to haul over the hills, with danger of upsetting. One horse can draw the dusting machine; it takes two for a sprayer.

But what about the results? Some growers are getting splendid results, others not so good. C. H. Deur, an Iowa grower that I have talked with about the practice, had good results dusting apples for four years, then struck a bad year and gave it up. Growers in the Ozarks refuse to give up the practice (dusting really was born and grew up in the Ozarks), even though some unfavorable reports get out. It seems that for every man who tries dusting and quits, three disciples are gained, for the practice is more widespread than ever. New Jersey peach growers swear by their dusters, and New York apple growers use dust on their apples. Some of the poor results are traceable to poor mixing of dusting materials. Commercial firms sell good mixtures.

Boiled down to a practical application, the facts are as follows: Dusting effectively controls biting and chewing insects, such as codling moth, on apples. It is less efficient on apple diseases. If the apple orchard is comparatively free of scab, leaf spot and sooty blotch, dusting is a pretty safe thing for a busy dairyman to use. Peach diseases and insects are controlled by dusting.

Pennsylvania. MARTIN GLEN.

A year's record of this BROWN SWISS: 16,538 lbs. milk, 646 lbs. butter fat. A good example of carefully safeguarded health.

Dairy Profits Depend On—What?

GOOD feeding and good breeding, partly, of course. These are routine considerations every dairyman knows. But, after all, the health consideration is the real fundamental.

As a milk-making machine, the dairy cow's production must depend on her bodily health—entirely. Actual or approaching disease can soon wipe out a cow's profit balance.

Because the hard-worked organs of production and reproduction are a natural prey of disease, the medicinal properties of Kow-Kare have been designed especially to tone up and strengthen these organs. Such cow ailments as Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches can be prevented or successfully treated by cow owners with the aid of this wonderful medicine.

A trial will cost little; results will be conclusive. Sold by feed dealers, general stores and druggists, 70c and $1.40 packages. Write for free book "The Home Cow Doctor."

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.
15% More Milk
Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.
Libbey Automatic Water Bowls
are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.
If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

San Joaquin Valley
California

There is but one California. It is a garden. It is a scenic paradise. It is the place of no winter. You get the most out of life for yourself and family. See it, this winter, when the East is snowbound.

You Can Farm All Year in California

Santa Fe

No storing costly fodder for months of snow and ice. Here you can profitably raise alfalfa, grain, fruit, stock and poultry. You have benefits of established communities. Schools are ready, and fine roads. The various fruit associations have a remarkable marketing system. You raise the fruit; no bother about markets. That problem has been worked out for you.

Land values still are within reasonable bounds—considering what you get in return. The San Joaquin Valley can support many thousands of families, on twenty and forty acre tracts. The world competes for what you raise, because of superior quality.

The Santa Fe operates *five trains a day* from Chicago and Kansas City to winterless California. Two of them—the California Limited and the San Francisco Limited—are *solid Pullman trains* with dining cars all the way. The Navajo, Scout and Missionary carry standard and tourist sleepers and chair cars; meals in dining-cars east of Kansas City and at station dining rooms west. Meal service for all trains by *Fred Harvey*. The two Limiteds and the Missionary have through sleepers by way of *Grand Canyon of Arizona*, the world's scenic wonder. The Santa Fe *tourist sleepers* are comfortable and you save half on the berth rate. Station meals also are economical—a "square meal" for a dollar.

Our illustrated folders, descriptive of California lands, and the trip there, mailed on request. Let me help you plan your trip, and advise about places worth looking over.

Second Iowa Guaranty Holstein Sale

The Iowa Breeders' Second Guaranty Sale held at Des Moines, Nov. 16—17 was very successful from at least two standpoints. It was a sale of healthy, well bred, good individuals that were largely purchased by new breeders throughout the state, so that the ultimate benefit of such a sale to Iowa breeders generally will undoubtedly be greater than as if the same cattle had been purchased by established breeders at higher prices.

The 69 head sold for an average of $327 with $675 the top figure. This was paid for one of the first animals in the ring, Home Farm Sadie Vale Mercedes, a yearling granddaughter of K. K. S. V. bred to King Pietertje Ormsby Piebe. She was consigned by Hargrove & Arnold and purchased by H. Schroedermier.

As at earlier sales bulls moved slowly and for low figures. Iowana Farms sold the best bull buy of the sale for $600. He was a 22-month-old grandson of that great cow, Fryslan Waldorf and from a 20,000-lb. 2-year-old daughter of Sir Johanna Fayne. The Independence State Hospital was the purchaser.

Mack & Krause did the selling with B. D. Scott in the box.

Following is a list of all animals selling for $350 or more and buyers:

Porter Farming Co., Iowa	
Pietertje Burke Korndyke	$510
Iowana Mercedes Ollie Homestead	$550
F. H. Heidman & Son, Iowa	
Miss Wopin Josephine	$385
Iowana Friend Homestead	355
H. C. Missly, Iowa	
Hyacinth Nelle De Kol 2d	$400
Pet Pontiac Dublin	375
Double E. Holstein Farm, Iowa	
Elsie Urmagel Hester	$450
Beryl Korndyke Lockhart	450
Pietertje Walker Korndyke	375
Flo Walker De Kol	445
G. Zwaagstra, Iowa	
King Violet Ormsby Pietertje	$500
Independence State Hospital, Iowa	
Iowana Waldorf Lad	$600
Clarinda State Hospital, Iowa	
Iowana Korndyke Ormsby	$400
Paul W. Anderson, Minnesota

Royal Miller, Iowa	
Aaggie Pontiac Butter Boy Pett	$375
Princess Lady May 2d	410
H. Schroedermier, Iowa	
Home Farm Sadie Vale Mercedes	$675
J. A. Peters, Iowa	
Lillie Mona	$650
W. S. Leaverton & Son, Iowa	
Lady Hengerveld Forum De Kol	$510

Three Michigan Holstein Sales

October 19, 20, and 21 Michigan held three notable Holstein auctions, the Michigan Holstein Breeders' Second State Sale, the Central Michigan Holstein Breeders' Third Annual Sale, and the Shiawassee County Holstein Breeders' First Annual Sale.

In the first, 54 animals sold for $26,255, making an average of $486. E. G. Stevenson of Ontario was the heaviest purchaser, taking seven animals. He purchased the highest priced animal of the sale, Traverse Segis Johanna Hartog, a six-year-old daughter of King Segis De Kol Paul Netherland. This cow has a five-year-old seven-day record of 26.33 pounds of fat and a two-year-old seven-day record of 16 pounds of fat. She brought $4,000. The second highest priced animal of the sale went to the Michigan School for the Deaf at $1,100. This is a three-year-old cow with a seven-day record of 16 pounds of fat. The only other animal to bring $1,000 or more was Traverse Korndyke Girl, purchased for that price by E. G. Stevenson. The following lists the animals selling for $500 or more:

E. G. Stevenson, Ontario, Canada	
Traverse Segis Johanna Hartog	$4,0
Traverse Korndyke Girl	1,0
Traverse Inka Korndyke	
Traverse Ninnetta Segis	
Beach Segis Pontiac Queen	
Burtondale Lady Pietertje 2d	
Michigan School for Deaf, Michigan	
Rainbow Hengerveld De Kol Meredith	$
Alcartra Pontiac Elzevere Vale	
Aaggie Texal Segis Pieter	1,1
Grandview Ormsby Segis	
Belle Perfection De Vries 4th	
W. L. Rundel, Michigan	
Sir Pieter Korndyke Lyons	$7
W. H. Wernett & Son, Michigan	
Belle Bernardo Segis Pieter	$5
Butter Maid Segis Pieter	7
E. M. Starkweather, Michigan	
Segis Pieter Butter Girl	$5
Stoneacre Lunde Pontiac Canary	5
J. M. Williams, Michigan	
Count Veeman Hengerveld De Kol	$5

In the Central Michigan Sale, animals sold for $11,960, an avera of $206. The highest priced anim was Itsamere King Cantrilla, co signed by C. A. Daniels & Son a bought for $450 by J. B. McCulle The only other animal to reach $4 was Jolie Sarcastic Dutchess 2n consigned by Wesh and Higimire. A mals selling for $300 or more were:

Edwin Vanderbeck, Michigan	
Rose Fern Butter Boy	$3
Frank Witz, Michigan	
Maple Fern Korndyke Pietertje	$3
C. Severance, Michigan	
Unnamed Male	$3
Mark H. Piper, Michigan	
Queen William Abbekerk 2d	$3
Lady Ophelia of Cornelian 2d	3
J. B. McCollum, Michigan	
Hartog Content Segis	$3
Itsamere King Cantrilla	4
Canary Johanna Mapleside	3
Hypatica Pauline De Kol Posch 2d	3
Colver Farms, Pennsylvania	
Lady Mercedes Houwtje 2d	$3
E. M. Moore, Michigan	
Jane De Kol Hengerveld Korndyke	$3
G. T. Warren, Michigan	
Jolie Sarcastic Duchess 2d	$4

In the third sale, that in Shiawa see County, 81 animals brough $19,290, an average of $238. T highest priced animal was Rosy Me cedes Butter Boy, bought by G. Spillane & Son for $1,000 and co signed by H. A. Smith. The Detro Creamery Company paid $530 eac for Belle Barnum Canary Scott, four-year-old cow consigned by Fre E. Martin, and Elzevere Rosa Bo heur 2nd, consigned by Charles Payne. The following lists the an mals selling for $300 or more:

Musolff Bros., Michigan	
Lowland Allie Lass	$3
Lowland Dolly Johanna	3
Huron Hill Pontiac Korndyke	3
De Kol Feldora Lass	5
G. L. Spillane & Son Co., Michigan

Meyd Hengerveld Canary Korndyke	$3
Bonny Maple Canary Application	3

Holstein Grades Average $240

The old adage, "There is alway room on top", has been well illustrat ed in a Holstein dispersion sale at th farm of J. C. Paige, Massachusetts Despite the fact that good grade cow in that section are averaging $125 22 grade Holsteins averaged $240 The cows were all handsome individu als, the result of many years' selectio of pure-bred sires on grade cows. Th top price was $365 and two other sold for more than $300. It merel proves the public is always ready t pay for commodities which excel th general run which is offered on th market.

Massachusetts. ERNEST RITTER.

Don't Wear a Truss

Mr. C. E. Brooks

Brooks' Appliance, the modern scientific invention, the wonderful new discovery that relieves rupture, will be sent on trial. No obnoxious springs or pads.

Brooks' Rupture Appliance

Has automatic Air Cushions. Binds and draws the broken parts together as you would a broken limb. No salves. No lies. Durable, cheap. Sent on trial to prove it. Protected by U. S. patents. Catalog and measure blanks mailed free. Send name and address today.

Brooks Appliance Co., 467 B State St., Marshall, Mich.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Determining Pregnancy

To decide whether a cow is in calf or not often is a matter of much moment to the owner or prospective buyer and he should know the various indications of that condition and the methods by which pregnancy is determined by manipulation as well as observation.

When conception has occurred periods of heat fail to recur in a majority of instances; but it is possible for a cow to come in heat although pregnant and if bred a double conception or fetation occasionally occurs. In many cases, however, the bull does not serve a cow that apparently is in heat after having been bred at a previous period of heat, and that may be taken as highly indicative of the pregnant state. The cow that has conceived usually quiets down and gains in flesh or fat during the first few months of pregnancy, but may lose in condition when parturition time is approaching and the udder begins to enlarge.

Increase in the size of the udder after service usually is a sure sign of pregnancy and the abdomen also will gradually become more and more prominent, especially toward its rear parts, and this is best noticed when standing behind the cow. In some poor milkers the secretion of milk soon shrinks after conception has taken place and the tendency is for such a cow to "dry off" several months before calving. The udder in such cases also gradually shrinks in size.

Manual methods of determining pregnancy used to include pouring water into the ears, the supposition being that a non-pregnant cow would shake her whole body to get rid of it. That, of course, is not a sure sign; but examination by feeling or palpatation through the abdominal wall or by way of the rectum or vagina gives definite results. After five or six months it is quite possible to feel the fetus in the womb by pressing the closed fist into the abdomen at a point on the right or milking side, under the body, 8 or 10 inches in front of the stifle, below the flank and above the udder. When the fist or palm of the hand is partially withdrawn the fetus follows it and may be felt as a firm mass. Movements of the fetus also may be felt in some cases, or they are seen when the cow drinks cold water or eats heartily. Cold water thrown on the belly may have a like effect. During the last two months of pregnancy movements of the fetus usually are vigorous and quite noticeable.

The trained veterinarian can definitely determine pregnancy by rectal examination of the womb 60 days after conception, or earlier in some heifers. Fluid is felt in the horns and they have lost their cordlike feel. Later one horn, containing the fetus, is found larger than the other and the expert may even be able to detect the cotyledons. This becomes easier later and then the parts of the fetus may also be made out. In all cases the veterinarian should be employed to make such critical examinations as he alone is able to do it correctly and safely and arrive at reliable conclusions. The bungler may cause abortion.

ABORTION

Dr. Geo. Hollabush's remedy a general tonic for cows and mares will prevent abortion and make prompt breeders and correct failure to clean. I guarantee and refund money if not satisfactory. Send for circular.

ABORTION IN CATTLE

CAN BE TREATED SUCCESSFULLY AND YOUR COWS MADE PROMPT REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY, Dept. A, 398-408 Columbus Ave., New York City, Reference—Colonial Bank.

Strong Milk

I have a cow that calved in May last and for some time gave about three gallons of very good milk a day; she now gives less than two gallons. She is fed on dairy feed, hay, beet pulp, and the little grazing she can get on a small lot. She appears to be in good condition; but the milk has a strong and offensive odor and nauseating taste, especially when heated. When strained through a cloth, stringy and curdy masses are left on the cloth. Can you tell me the cause of the condition, how it can be remedied, and whether the milk is fit for use?

Portsmouth, Va. W. G. M.

Set a sample of milk from each quarter of the udder in separate sterilized vessels. By this means you can determine if one quarter is giving abnormal milk, as a result of garget, or if all samples are abnormal. If the latter is the case, bacteria in the milk utensils, wash, or cooling water or dust from the udder, stable, or rooms in which the milk is handled may be the cause and the exact one should be found and removed.

Indigestion is another possible cause. If no other cause is found, give the cow a pound of Glauber salts and a cupful of blackstrap molasses in 3 pints of warm water, slowly and carefully from a long-necked bottle, to clear the bowels. Then mix in each feed a tablespoonful of a mixture of two parts of powdered wood charcoal and one part each of powdered nux vomica, bicarbonate of soda, and ground gentian root. Stop feeding beet pulp. Feed mixed meals, bran, and dried brewers grains or gluten meal. Add clover or alfalfa hay to the ration.

Warts on Teats

We have a cow that has almost a solid mass of warts on one of her teats. Could you give information how to cure them? The cow is milking at present.

Sumner, Wash. J. W.

Twice daily saturate the warts with water containing all the bicarbonate of soda it will dissolve when hot. If that does not suffice, use a strong solution of washing soda. Warts that have narrow necks may be snipped off with scissors, a few at a time; then apply pine tar next day. If a wart starts growing again, rub it lightly with a lunar caustic pencil two or three times a week.

Warts on Head

Kindly advise one how to remove warts from pure-bred Holstein bull? They look like blossoms. One large one on forehead, a smaller one under eye, and several on body. They don't seem to bother him any but detract from his appearance quite a little.

Kane, Pa. W. H. B.

If the warts have narrow bases, they may be twisted off at once, or caused to drop off in time by ligating tightly with a fine cord. Or they may be cut off with scissors and Monsel's powder applied to stop the bleeding. Masses of small warts will disappear in time if wetted daily with a strong solution of washing soda. Pine tar is useful as an application for masses of warts on the body. It should be well rubbed in with an old, stubby paint brush and the application repeated at intervals of a week.

Ayrshires Win Oregon Milknig Contest

Six Jerseys, one Holstein, and five Ayrshires participated in the annual two-day milking contest at this year's Oregon State Fair. The Ayrshires were much in the limelight, winning first and second places for Lathrop Bros. of Oregon. The Holstein entry placed third. Lathrop Bros.' third entry placed seventh. In computing the results, butterfat was estimated at thirty cents per pound and solids not fat at two and one-half cents per pound, the same figures as in previous years. The cattle were handicapped as to age and periods of lactation.

W. D. Pine of the Dairy Division of the Oregon State College supervised the contest.

Vermont. J. G. WATSON.

Uncle Ab says: It's only the fellow who is already wise that knows enough to realize that he needs to know a lot more.

SWINE

Economy in Production ← GUERNSEYS → Quality of Products

"Why wiggle and wobble?" Guernseys produce more butter and at less cost. The average Guernsey in the Wausau-Marathon (Wisconsin) Cow Testing Association produced 41 pounds more butterfat than the average cow of the breed next in rank. Moreover, she produced butterfat at a cost per pound of 3¼ cents less than the average cow of another dairy breed. Send for our free information.

THE AMERICAN GUERNSEY CATTLE CLUB, Box H8, Peterboro, N. H.

GRETCHEN'S ANTON MAY KING OF PROSPECT (61176)
Dropped October 30, 1919

SIRE — Anton's King Confidence No. 43517. DAM — Gretchen of Prospect No. 72341. An excellent individual. He has a good barrel, an excellent top line and a fine head. This young bull will do himself credit when given the opportunity.

His sire, Anton's King Confidence, traces six times to May Rose 2nd, the great foundation cow of the May Rose family. The dam of Anton's King Confidence recently finished a year's test with a record of 764.65 lbs. of butterfat as a junior four-year-old.

Gretchen of Prospect is now on test and in 182 days has made 230.57 lbs. of fat. She is running with the herd and receiving the regular herd rations and care — and twice a day milking.

This bull is priced so that the average dairyman can easily buy him.

Hoard's Dairyman Farm
Fort Atkinson - - - Wisconsin

For Sale — A Bull Calf of Real Merit

Dropped Aug. 28, 1920, and Sired by **Langwater Cavalier 21012**, whose daughters have put him to the front as one of the great bulls of the breed. His highest record daughter made 734 lbs. fat in F.

The dam of the **Bull Calf** is Georgette of Edgemoor, who is on test and is a daughter of Mildred II of Les Godaines (55120), who was the **Grand Champion** Cow at the **National**. Her record is 14,890.9 lbs. milk, 702 lbs. fat. Her daughter **Century Girl** was first prize two-year-old.

The **Bull Calf** is a fine individual and splendidly marked. Send for extended pedigree and full description. A few choice females to offer.

Do You Want A Guernsey Bull

Closely related to Pergue's Crescent A. R. with a record of 13,316.9 lbs. milk and over 582 lbs. fat in Class EE and dropping two calves within the year, entitling her to second place in her class? Some excellent young bulls closely related to Pergue's Crescent ready to head your herd. Write for descriptive circular, or come and see them.

Ernest W. Sass, Box H, Streator, La Salle County, Illinois.

A Correction

An error in the issue of Hoard's Dairyman for November 26 gives two splendid producing cows a mistaken presentation through an interchange of legends to cuts from their photographs. One is Pilot's Rockland Beauty, a Jersey from the Waikiki Farm of Washington. This good cow produced 13,288.8 lbs. milk, 766.91 lbs. fat in a year. Chilmark Rival Antoinette, a Guernsey owned by W. C. White, Ohio, is the other victim of our error. As a three-year-old she has made 11,221.1 lbs. milk, 580.71 lbs. fat, and now holds tenth place in Class CC.

Idaho Dairy Excursion

On November 6th a calf club and dairy excursion was held in Gooding County, Idaho. Thirty-five or forty dairy farmers and club members took part. The herds of Hasting and Anderson, A. S. Reams, W. H. Fowler, L. S. Perry, Riley Thorpe, Traville's Dairy, and Saum and Son were visited.

Gooding County is the first county in Idaho to have a testing association so large as to require two testers. It is one of the first counties to have excellent herds of each of the four dairy breeds. F. R. CAMMACK.

Sheboygan County Holsteins Average $340

One of the most successful Holstein sales held in Wisconsin this fall was the Sheboygan County Breeders' Sale at Plymouth on Nov. 20.

Sixty animals, practically all of them good ones and many with good records, brought $20,370, a $339 average, with 3 of them going for $1,000 or more.

Carl Swartz, Wisconsin, purchased the top of the sale, Neith Champion Witteen De Kol, a 31-lb. 1,045-lb. 6-year-old daughter of a 32-lb. cow for $4,000. She was consigned by Carl E. Brickbauer.

Another of the good ones offered was Clearland Hengerveld, a 2-year-old granddaughter of King Segis Pontiac Veeman that had just completed a 24.47-lb. record. She was consigned by D. E. Vanderhoof and purchased by the Pinehurst Farm Co. for $1,500.

Mack & Laux did the selling with Sale Manager F. H. Everson in the box.

The following list includes all animals selling for $300 and buyers:

Wm. Fenner, Wisconsin

Photo and pedigree on request.

Bull for Sale

Having been authorized to sell this bull at a very nominal price, I will give you a brief outline of his breeding.

SIRE—Sir Ormsby Banostine Champion. "The only son of Duchess Skylark Ormsby, the only 1,500-lb. cow." This is enough regarding the sire's breeding.

DAM—A 34-lb. cow with two A. R. O. daughters, and she out of a 29-lb. dam and she out of an A. R. O. cow.

This cow and her dam are individuals, and the dam of the bull is a sister to one of the present day sensational sires in regard to individuality and production of his offspring. Every cow in pedigree is an A. R. O. animal.

This wonderful son of this large producer is offered only for the fact that the herd is small and he is a bull that needs an opportunity.

Guaranteed for 60 days and right in every way. No abortion or T. B. in herd. He is dark, three years old, and weighs 2,400 pounds. Will sell outright or trade for stock of equal breeding.

Address Box 485

We Build for the Future

During this period of adjustment following the world-wide war, we are quietly working right along, making records and building a foundation for the future, in the greatest business on earth — the one that has weathered the test of trying business conditions — the one that is bound to be the first to come back to a normal basis.

There is Always a Market for Pure-bred Holsteins

The day of the scrub cow has been dying for some time. It is dead now. There never was much money in them — there is less now than ever. It does not pay to keep anything but the best.

There will probably never be another time when you can fill your barn as advantageously as now. Because of the scarcity of pure-breds and the fact that breeders are declining anything but the best — the future is assured.

Buy now — you'll not repent at leisure

Young Holstein Bulls Backed by Yearly and Seven-Day Records

Herd under Federal Supervision

We have several young bulls up to 17 months of age, sired by Maplecrest Sir De Kol, whose dam made 31.07 lbs. of butter and is a daughter of Daisy Grace De Kol, former World record Junior 4-year-old in the yearly production division.

These bulls are all well grown, and are of show type individuality. They are from dams with records up to 31.70 lbs. of butter in seven days, and 640 lbs. of milk.

Included in the above are a few young calves from 2 to 4 months of age from untested dams, which I will price very reasonable for immediate acceptance.

Prices and full description, with photographs will be furnished upon application.

These calves should be seen to be appreciated.

The Home of Healthy Holsteins

More Federal Accredited Herds than any other County in Wisconsin

200 Grades and Pure-breds ready for immediate shipment

WAUPACA COUNTY HOLSTEIN-FRIESIAN BREEDERS' ASSOCIATION, A. B. Rowe, Secretary, Waupaca, Wis.

The Dairy Division at Washington says:

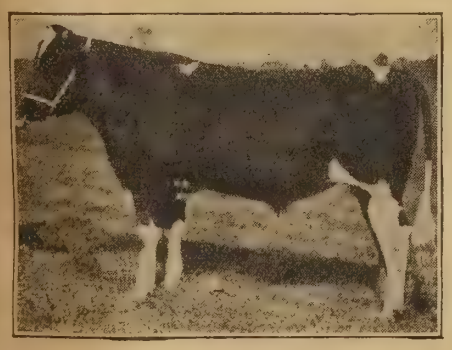
"As the production of a cow is doubled, profits increase three times. As production is trebled, profits increase six times.

"The average cow in the United States yields 1,823 quarts of milk yielding 207 pounds of butter a year. Average profit per cow $20 over cost of feed."

The average production of all purebred Holsteins that have been officially tested for a year is 629 pounds of butter from more than 7,000 quarts of milk.

In yielding more than three times as much as the scrub cow, the purebred Holstein yields six times the profits.

As production is tripled, profits increase six times.



Send for free illustrated booklets.

Another Good OHIO Sale—

Seneca County

Holstein Breeders' Sale

Dec. 8, at Tiffin, Ohio

A Sale Where You Can Buy Just What You Want From Among

40 Registered Holsteins
25 Good Grades

This is a sale of high class cattle — the best that could be selected from the good herds of Seneca County.

The Grades are young cows — straight, typy, good producers — all of them carrying the blood of first class registered sires.

The 40 registered animals are not just "pure-breds". They are quality cattle fit to serve as foundation animals in any herd. They represent some of the very best 7-day and yearly record breeding in this section of Ohio, much of it 30-lb., 1,000-lb. breeding.

The Sale is under the management of the State Association — It Must be Right.

Every animal sold subject to a tuberculin retest guarantee.

It "Stays Satisfactory"

John H. Lentell

Well Known Wisconsin Breeder speaks from 3 years Pine Tree Experience

Three Years Ago!

Beloit, Wis.

Pine Tree Milking Machine Co.
Chicago, Ill.

Gentlemen:
"Having used the Pine Tree Milker on my herd for a few months, will say I am much pleased with it. I could not get along without it. My cows show that they like it better than hand milking. There is very little stripping to be done after it."
(Signed) JOHN H. LENTELL.

Today!

Beloit, Wis.
Oct. 21, 1920.

Pine Tree Milking Machine Co.
Chicago, Ill.

Gentlemen:
"After using the Pine Tree Milker about three years I can say I am well pleased with it, and have added another double unit. I find the Pine Tree cuts labor costs in half. The cows still insist on the machine in preference to hand milking—not only the cows—but we do also. We would not try to keep a herd without the Pine Tree."
(Signed) JOHN H. LENTELL.

Other Evidence from the West

Worth 5 Times Its Cost

Bonner Springs, Kan.
July 10, 1920.

"Our machine is sure a dandy, have not had a minute's trouble. Would not have it taken out for five times the price it cost."
C. C. DUNBAR.

Son Now Milks 30 Cows

West Union, Ia.
Oct. 8, 1920.

"We are more than satisfied with the Pine Tree Milker. It did *more* for us than was claimed by the salesman. Our 19 year old son, Harold, has taken care of thirty cows since installing the Pine Tree Milker. We would not take it out for any price, if we could not replace with another PINE TREE at once. We cannot speak too highly of the Pine Tree."
(Signed) J. O. LARSON.

Upkeep 5c a Month

Elmwood, Wis.
Oct. 22, 1920.

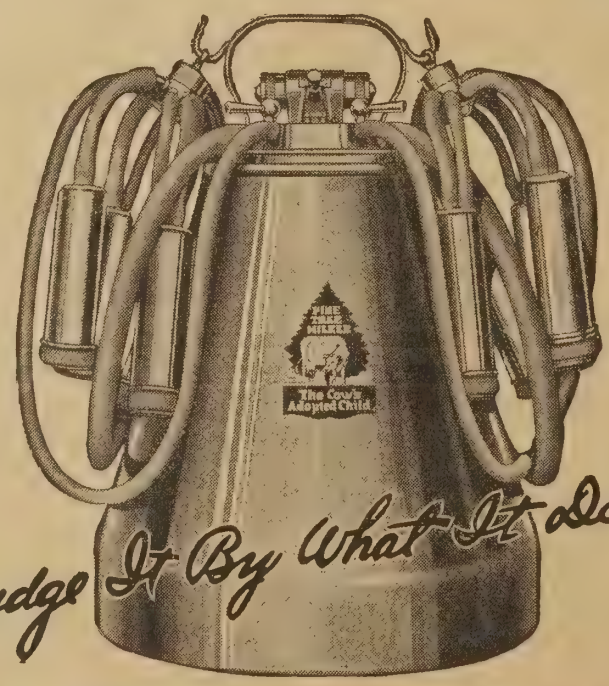
"I purchased my Pine Tree Milker July 1, 1919. During the sixteen months of use, I have never missed a milking. During that time the upkeep has cost me just 80c. The machine has proven to be satisfactory in every respect. With the use of the Pine Tree Milker it has been possible for me to do my work alone."
(Signed) LESLIE HOLT.

HUNDREDS of splendid letters come to us from Pine Tree users from Coast to Coast.

They are not written in that burst of enthusiasm on being released for the first time from the drudgery of hand milking. But from the experience of months and years.

They come from men who have used the Pine Tree through one or more full milking periods. Their records show increased production. They know whether it has saved money in time and labor—whether they have had to fuss and spend money for repairs—how easy it is to keep their machine in condition to make clean milk. And the thought between the lines in all these hundreds of letters is this:—*"It Stays Satisfactory".*

This is the greatest thing which can be said of any milker. The few letters we can print here are typical of all the others. They are a man's surest guide in selecting his milker.



Get the facts from your Pine Tree dealer. Let him show you local installations. Catch the enthusiasm of your neighboring Pine Tree users. Also write today for the "Book of Experience" in which 43 practical dairymen tell you how they cut expenses and increase production.

"Judge It By What It Does"

Dayno J. Pennock

Prominent New York Pine Tree owner tells of his experiences

First Impression

Chaumont, N. Y.
Nov. 20, 1918.

Pine Tree Milking Machine Co.
Syracuse, N. Y.

Gentlemen:
"The Pine Tree is giving me the best of satisfaction. Several hard milking cows in my herds are milking perfectly. I am satisfied I have the easist miker to operate and keep clean. Milking with a Pine Tree is a pleasure where by hand it was hard work."
(Signed)
DAYNO J. PENNOCK.

Two Years Later

Chaumont, N. Y.
Oct. 15, 1920.

Pine Tree Milking Machine Co.
Syracuse, N. Y.

Gentlemen:
"After two years my Pine Tree is giving the best of satisfaction. I was about the first one to install a Pine Tree in this section. I would not be without it and I would not exchange it for any milker I have ever seen."
(Signed)
DAYNO J. PENNOCK.

Word from other Eastern Boosters

Pulsator Never Failed

Cornwall, Vt.
Nov. 1, 1920.

"We have used the Pine Tree Milker about two years and it certainly has given us good service. The pulsator works to perfection, never has been once out of commission. The machine is very easy to keep clean. If we were to buy another Milker tomorrow it would be a 'Pine Tree.'" (Signed) A. J. and B. R. FIELD.

Not One Penny for Repairs

Edinboro, Pa.
Sept. 29, 1920.

"Last spring I purchased a PINE TREE for my herd of 28 grade and pure bred Holsteins. Have experienced the most satisfactory results. I consider this far ahead of hand milking. The cows stand better and give more milk. Have had no udder trouble. I have not spent a penny for repairs as yet. When I cannot use a Pine Tree I shall quit dairying."
(Signed) J. E. HARNED.

2 Years Perfect Satisfaction

So. Kortright, N. Y.
Sept. 28, 1920.

"After using our Pine Tree Milker for two years we are perfectly satisfied with same and fully believe that it is the best milker that has yet been put on the market."
(Signed) ROSE BROS.

BANISHING MILKING TROUBLES

Power Milking Reduces Labor and Production Costs

C. A. LECLAIR, WISCONSIN

"I WOULD no more think of resorting to the cutting of grass with a scythe, harvesting small grain with a cradle, or skimming milk by hand than I would of returning to hand milking since seeing how well a mechanical milker serves on my farm. It not only gives me two hours more time to work in the field each day, but it is now possible for me to be away at milking time when occasion demands. My wife and boy are able to run the equipment fully as well as myself. Milking is no longer a tied down proposition for me and we are able to produce more and better milk."

This is the testimony of Julius Pohl, Outagamie County, Wisconsin, only one of the most satisfied users of milking machines in this country. I have yet to find an instance where a standard machine in the hands of an intelligent operator has been displaced. Yet in spite of the fact that nearly every mechanical milker on the market today is a more perfect substitute for the calf than hand milking, there are at present not more than ten per cent of the dairymen in the United States using power milkers. Of those using mechanical milkers, about 90 per cent bought their equipment within the past ten years. In other words, the swing of the pendulum toward power applied to milking has just begun in America. Nothing can now stop the interest in a machine which is actually capable of taking the drudgery out of the dairy business. The subject of milking machines is a topic of conversation now whenever two or more farmers who keep cows meet. Farmers have come to realize that the use of milking machines is the next step in the economical management of all but the very small sized herds. The old conservatism is gone. It is today quite generally understood that the occasional cases where unfavorable results from the use of such machines are reported reveal a fault other than the equipment. In other words, standard milking machines have passed long since beyond the experimental stage so that when somebody knocks them it means that they failed to operate them properly or had unadaptable cows.

In the application of power to farming, America has for the most part led the world. In the case of the mechanical milker we have let Australia and New Zealand set the pace for us. In these countries today there are few farmers milking as many as thirty cows who do not have mechanical milkers. Several things have heretofore prevented a more general use of power milkers in America. At present these conditions have been largely altered and as a result there are going to be more dairymen investing in mechanical milkers from now on than in any other form of modern equipment. This is only to be expected when one considers that a milker is about the only machine on a farm that is put to use at least twice every day of the year.

Poor salesmanship, more than anything else, was responsible for the past slow growth in popularity of mechanical milkers. Not only did agents fail to overcome the natural conservatism of farmers with respect to these machines, but in many instances incompetent dealers unintentionally blocked embryonic interest on the part of dairymen in such equipment. In speaking of this situation, a prominent manufacturer of a standard make of milker said:

"Up to very recently the milking machine business was as rotten as the lightning rod game. Salesmen of certain companies have actually killed rather than made new business. In their selling methods some have not only been unbusinesslike enough to apply a hammer where they should have used a saw, but they have stooped to the unwarranted practice of knocking competitor's machines on the false grounds that these lacked certain essential parts which are in fact non-essentials."

Another thing that has caused unwarranted disappointment regarding milking machines is that some agents have been so anxious to place their outfit that they foolishly made extravagant claims for it. In certain instances dealers have gone so far as to state that hand stripping was not necessary after machine milking. This is an absolute mistake. Although the amount of stripping is usually very small it should nevertheless be thoroughly done. Other agents have minimized the necessity of daily cleansing of the equipment. The truth is that with power milkers it is possible to produce the very cleanest or the very dirtiest milk, depending upon the care of the machine.

Today there is growing to be a better understanding among the trade, and companies are beginning to realize that a good machine poorly placed not only does not bring future business but stops the advance of the trade more than it can be pushed by one hundred satisfied users. Few if any machines are now sold to men who appear as though they would be incompetent operators. Farmers who keep herds of a nondescript character, poor milkers that would not yield to a calf, are not looked upon as desirable men with whom to place a mechanical milker. The dairyman who feeds marsh hay to his cows and who has a record of breaking more fork handles on their backs than he does forking manure is also in the class of undesirable prospects.

What Farmers and Specialists Say

If the truth about mechanical milkers is anywhere to be found it should be in the verdict of the unbiased agricultural college experts. In answer to the question, "What type of mechanical milker shall I buy?" investigations by one of the leading experiment stations of the country reveal that a simply constructed milker does as good if not better work than a complex outfit. In an article published from the South Dakota College of Agriculture it was emphasized that if a close fitting rigid cup is placed over a cow's udder, air tight at the base and open at the other end, and a calf allowed to nurse, the milk will be extracted as rapidly and with no more discomfort to the cow than when the calf nurses as nature intended. This means that proper suction applied by a machine is the main requisite to good milking. Milkers of simplified construction, consequently, ought to be the cheapest and the least costly to maintain. A properly operated milker of this type is really a better substitute for the natural calf milking than is hand milking. It is a known fact that many highly productive cows have been ruined by tired or careless employees. In this connection Pro-

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

World's Record Quality Milk Producer

Princess of Meadowbrook, a Guernsey cow owned by the Brant Rancho, California, has a most remarkable record as a quality milk producer. At the Liberty Fair held in Los Angeles in 1918 her milk and cream were awarded the two highest scores ever given up to that time. At the National Dairy Show her milk and cream received the two highest scores ever given in the world and the first and only 100 per cent score ever given in the world. At the San Fernando Valley Fair, California, she received the Globe Cup for the "highest quality cow any breed, cow and her product considered." In this contest her milk received the score of 99.4 per cent, the highest ever given in any contest except at the National Dairy Show where her milk won first place and a gold medal.

Besides producing quality milk she does it in large quantities. Her first record was for 14,560 pounds of milk and 722.24 pounds of butterfat, the highest record for the breed in the West when made. The following year she increased this record to over 745 pounds of butterfat. She was first prize aged cow, senior and grand champion female at the California State Fair in 1919 and 1920; also first prize Advanced Registry cow and member of the first prize aged herd and first prize dairy herd in 1920. She and a sister were first prize produce of dam at the 1919 California State Fair.—AMERICAN GUERNSEY CATTLE CLUB.

Jersey Cattle Notes

For week ending November 19:

Number of animals registered: Bulls, 202; cows, 465; total, 667. Number of transfers recorded: Bulls, 209; cows, 722; total, 931.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Gifts We Want

Some gifts I'd like on Christmas morn,
To make my dairy life complete.
A patent sheller for the corn,
A modern plant for winter heat.
I'd like two silos of the best,
Cream separators—well, say two.
(They'll give us all a needed rest.)
It's what progressive farmers do.

I want electric lights this year,
And power—and a tractor fine,
Macadam roadways running near,
A telephone—my private line.
I'd like a slicked-up motor car,
To take me to the movie show,
Where all those other racers are,
A handsome motor truck or so.
New cows to make a wonder herd,
All pedigreed and milking-wise.
My heart then, like a singing bird
Will raise its pean to the skies.

Hang on the tree these minor gifts,
These little things I want and need,
And, when the day its glory lifts,
'Twill find me worthy of the deed.
May boughs be strong and purses wide,
And may your Christmas list be long.
Contented, will I here abide,
Head high in air—soul filled with song.

⚜

"There's one thing that would make my wife completely happy and satisfied, Bill."

"What's that?"

"If she could have a ring put in my nose and a rope fastened to it."

⚜

When the herd goes into winter quarters there is no reason to let the cows think that summer has gone forever and that there will never be any more clover. I always liked Jim Allen's way: his dairy barn is so all-fired cozy and snug and comfortable, that if you close your eyes, you can almost think you are driving the cows to pasture, down some shady lane.

⚜

When Little Eloise, from town, saw the hired man headed for the barn with a bucket of mash on his head, she wanted to know if that was the "balanced ration" she had heard so much about?

⚜

"Did you ever work on a dairy farm before?"

"No, sir."

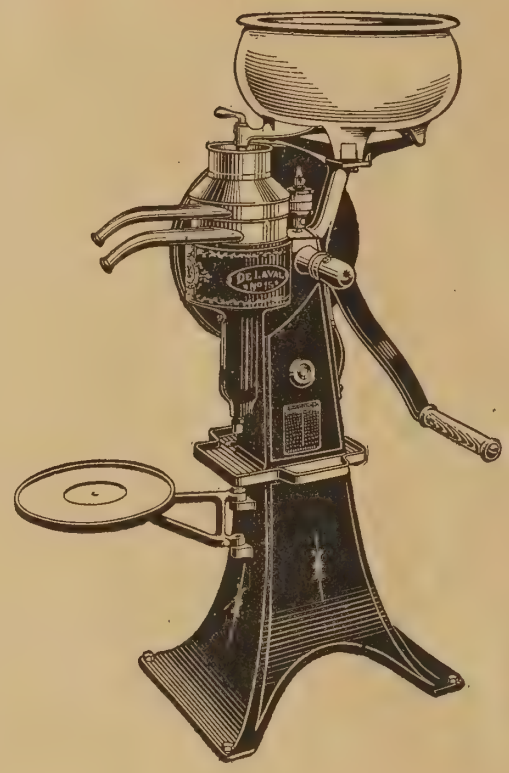
"Ever milk a cow?"

"No, sir."

"Then what makes you feel you can get a job here?"

"Well, it's just like this. I always liked the country and I'm mighty fond of milk."

⚜



If the average city woman could look down into the average farm cellar and see the jams and jellies and potatoes, and apples, and goodness-only-knows how many other things, she would swoon away from sheer jealousy.

⚜

Nearing Christmas

It's on days like these
That I'm happy
Over being farm-raised.
Somehow,
I link Christmas and good things to eat,
And happiness of the heart
And contentment
With the farm.
I speak from experience,
For I have been far
Into the city paths,
And always, my heart was back
To a little country mother
And to God, and the stars and the fields.

Wherever there are cows there should be a DE LAVAL SEPARATOR

A DE LAVAL Cream Separator is an essential piece of equipment on every farm where there are two or more cows. Even though you sell whole milk you should have a De Laval to protect you against changing market conditions. It will turn the surplus you sometimes have into a readily marketable product.

Thousands of De Lavals have been installed to meet such emergencies and each one has paid for itself many times over In all, there are more than 2,500,000 De Laval Separators in use throughout the world — each one giving its owner service and profits that he could get from no other machine.

The De Laval skims cleaner, turns easier and lasts longer. Therefore it is the most economical and most satisfactory separator to buy.

Ask the De Laval agent nearest you for a demonstration, or write nearest De Laval office.

The De Laval Separator Co.

Defeat in New Orleans Milk Strike May Benefit Louisiana Dairymen

Dairy of F. E. Briggs who keeps 18 cows on 12½ acres and makes a go of it. Crab grass and cottonseed hulls are fed for roughage. The present concentrate mixture is 400 lbs. cottonseed meal, 200 lbs. bran or alfalfa meal, and 100 lbs. hominy feed. As much as 1 lb. of grain is fed for each pound and a half of milk.

MANY a year will pass before the events of nineteen twenty are forgotten in the Louisiana Dairymen's Association. For the twelve-month has shown that organization little favor unless a goodly invoice is given the intangible benefits from costly experience. A milk strike called was promptly and decisively lost, dissatisfaction and dissension have spread among its members, and the year ends with a federal indictment over three of its officials. Hardly a cheering situation, yet the promise of 1921 is one of optimism rather than pessimism for the dairy farmer of Louisiana.

The trouble began when the association called a milk strike May first on New Orleans, its principal market. The price paid to that date was $5.34 for 4 per cent milk, f. o. b., New Orleans. That was for the regular supply—surplus was paid for at butterfat prices and not welcomed at that. The season of heavy flow was on and producers needed a larger market. In an informal conference it was unofficially agreed, by the producers present and the representatives of the distributors, that the price should be temporarily cut to $4.41 and reduced two cents per quart to the consumer in an effort to increase consumption sufficiently to handle the surplus. The distributors accordingly set the price at $4.41 and the association, in session the next day, voted to strike!

Strike Called Against Advice

This action was taken against the advice of conservative members and of those who had served as leaders in times past. They emphasized that in a time of surplus and with the price favorable, as compared to that in other sections, a strike should be employed only as a last resort. It was urged that the producers should accept a reduction, advertise their decision to the consumer, and then increase the price when the supply was reduced. But feed prices were exorbitant and not on the decline, labor was scarce and costly, and farm expenses were very high even though pastures were bringing some relief. The producer could not see why milk should go down in price when its production cost stayed up. He declared that selling prices should follow costs and that returns to the producer should be on the "cost plus" plan. He did not realize that neither the distributor nor the consumer of New Orleans cares what it costs Louisiana dairy farmers to furnish the city with milk—that they want milk at the lowest possible price. When he decided to strike, he failed to consider that universal law—in operation long before milk was sold for city distribution—the law of supply and demand.

Chicago Milk to New Orleans

At once Mississippi increased her daily shipment of milk to New Orleans, thereby lessening the effect of the strike. To prevent this, effort was made toward organization of the producers of that state with the resulting indictment of I. S. West, Peter Fabacher, and J. P. Wallace for "willfully, knowingly, and unlawfully conspiring to restrain trade and commerce among several states". The case has not come to trial. Meantime pasteurized, iced milk in carload lots came from Chicago in such quantities as to make the distributors entirely independent of Louisiana producers in the quantity of milk supplied. Moreover, city health authorities approved the quality of the imported product. The cost of this milk is disputed, distributors claiming it was cheaper than the price demanded by the local association. At least its continued flow into New Orleans made the strike hopeless. An effort to prevent the re-sale in Chicago of milk purchased from the Chicago Milk Producers' Association failed—the Chicago buyer claiming the right to sell wherever he could get the best price. It was apparent that New Orleans distributors could outlast the association. A producers' committee sent by the secretary made an agreement with the distributors which led to discontinuing the strike—thirteen days after it was begun—and accepting the price of $4.41. This price was continued throughout the summer until September, when the present price of $5.34 was again paid.

A dairy farm supplement who will have much to do in the success of dairying in the South.

Strike Weakened Association

The association lost in strength and influence in the experiences of the period of thirteen days. However, the strike brought out two valuable conclusions concerning the milk prices. It proved that the "cost plus" plan fails to work—that supply and demand set the price. It demonstrated that refrigeration and transportation facilities greatly increase the territory in which supply must be considered and that, for the time at least, the price of milk in New Orleans was the price in Chicago plus railroad charges.

Work for the Association

There is no general feeling of discouragement among Louisiana dairymen because of the defeat of their association. Rather, there is a prevalent opinion that the lessons taught in the failure of the strike may operate to the organization's advantage in the future. There is a determination to strengthen the producer's position and a readiness to follow constructive leadership in improving both the production and the marketing of milk.

In the city: In the first place increased recognition for the producers' association is needed. At present the distributor insists on dealing directly with the producer. A strong organization can better represent the producer than can individuals. The producer demands a voice in determining the price to be paid for his milk. He can only secure this right when he has a well directed organization.

Some plan must be perfected for disposing of surplus. It has been badly handled. There are no creameries and too few hogs on the farms to make good use of skimmilk. The whole production is shipped, regardless of the demand. The largest distributor has turned a considerable quantity into a drip-clabber cheese, a strictly southern product, selling as much as 10,000 lbs. per day. This company has made some plans for constructing a condensery. The producers are contemplating half ownership of a creamery in New Orleans where milk will be handled and sold to distributors and where they can take care of surplus. A campaign is now on for the sale of $100,000 worth of stock, enough it is said, that the producers would control the plant.

Milk needs advertising in New Orleans. The present daily consumption is only about 18,000 gallons. The consumer is not informed of the food value of milk or of its relative cheapness. Neither has he been told the producer's side of the strike last spring which resulted in Illinois and Wisconsin milk and cream replacing the Louisiana product on his table in May. Increased consumption would take care of surplus—and advertising will bring that increase. The condenseries, seeking new markets, advertised widely in New Orleans this fall and so greatly increased the use of their product as to markedly affect the consumption of whole milk. If the distributors join in a publicity campaign, so much the better; if they will not, the association can well afford to carry it on alone.

Barn on quarter section operated by L. Anthon. Because of labor shortage, no crops were raised this year; the silo lays piled at the right. Twenty years ago 50 cows were milked in this barn when milk sold for 14 cents per gallon. Fifty gallons are produced daily now and a profit of $175 per month is being made.

In the country: The Louisiana Dairymen's Association has good opportunities in reducing the cost of milk to its members. Even with ten months of pasture, mild winters, low building costs, and cheap labor, milk is not made cheaply. This year on many farms no crops were raised, not even to fill the silos, the only production from the land being native grasses. Scarcity of labor is blamed. All concentrates and much of the roughage is purchased for many herds. This answers the question, "Why must milk sell so high in the South?" An authority on Louisiana dairying gives three reasons: Soil less productive than in older dairy sections; too little home grown feed; and lack of experience in handling the dairy cow. These facts outline a great need for activity in the producers' association in improving dairy farming conditions. C. H. Staples writes, "Success in dairy farming does not depend altogether on the price of whole milk. Other factors are of equal importance."

There is much need for better shipping service. Milk is placed in cars with products which contaminate it and it is carried in temperatures so high that its quality is greatly injured. By establishing cooling stations, milk could be delivered to the city at much lower temperatures.

So, the promise of 1921 is one of optimism for the Louisiana Dairymen's Association. Its members realize the work before it and know the mistakes in production and marketing in the past. The defeat in the 1920 milk strike may well be turned to victory through a strengthened and rejuvenated organization.

House and part of the dairy barn on the Louisiana farm of Geo. L. Gaden—an encouraging demonstration of what can be done with cows in the South. All the lumber used in this thoroughly modern home was cut on the farm. The barns are planned to hold 240 cows. There is a refrigeration plant for use in summer, electric lights, and sanitary equipment for producing clean milk and getting it to the shipping station at the barn in excellent condition. An accredited herd of 500 head of Jerseys is maintained, 150 of which are now in milk. About 200 gallons of milk were shipped daily in November when many cows were well along in lactation. The price received was 46 cents per gallon for 4 per cent milk and the daily returns totalled about $100. Mr. Gaden bought the first Jersey he ever saw, 34 years ago. More than fifteen years ago he owned 60 cows. He knows southern dairy[illegible] His silos and his improved permanent pastures are evidences of his solution of the feed problem. He states that a mixed pasture of Bermuda grass, vetch, and canary grass will easily carry t[illegible] to the acre. He is enthusiastic over the possibilities for dairying. He says of his 3,000 acres: "The farm couldn't run without the cows."

DAIRY CATTLE VALUATION

G. C. WHITE, Professor of Dairy Husbandry, Connecticut Agricultural College

FOR five or six years a live stock judging demonstration and judging contest has been one of the features of the summer program of the farmers' meetings at the Connecticut Agricultural College. The idea has also been carried out into the state quite extensively, at field meetings, and much benefit has been derived, especially by beginners. More recently much interest has developed in pure-bred cattle and many farmers are desirous of finding just what factors influence their value and why some animals sell for several times more than others. The idea of a mock sale was conceived to take the place of the judging demonstrations. The results showed that the mock sale provided even greater interest and educational value than was anticipated.

Those who discussed it afterwards declared it to be the finest demonstration they had ever participated in. A pedigree and other necessary information for each animal was provided to all present. An experienced auctioneer cried the sale and those present bid on the animals. One of the rules was that no bid could be started at more than $200 and a raise of no more than fifty nor less than five dollars was accepted. The purchaser was required to give reasons for his bid. Others who dropped out in the bidding before the final price was obtained also gave their reasons and all were free to criticize the animal or the price in any way they desired. Herein lies the success of such a program and the sales manager is an important cog in the wheel. The sale was very lively at all times and the audience entered into the affair freely.

Before the sale all the animals were gone over carefully by a committee which placed a conservative price on them. Each animal was selected with some idea in view to bring out. Four Guernseys, four Ayrshires, three Holsteins, two Jerseys, two Shorthorns, and four draft horses went under the hammer, 19 in all. This consumed about two and one-half hours.

Only one animal sold for less than the estimate of the committee. One sold for the same figure and the others sold higher. The average valuation of the committee was $423. The average price they sold for was $695. Evidently the committee was too low in their estimate; possibly some of the animals sold for more than the purchaser could make a profit on. However, it demonstrates the value of the public sale for, if the right kind of crowd is present, and the sale properly conducted, the animals will generally bring all they are worth. In order to discourage overbidding, a blank was put in the hands of each person upon which they recorded the price they would like to buy at, as well as the maximum price they would pay if forced to go higher by some other bidder. Hence each person participating made up his mind before the animal was sold. Also the giving of reasons tended to keep the bidding within bounds.

The traffic in pure-bred live stock in this country is very large indeed. Approximately 300,000 registered dairy cattle changed hands last year which represents a value of at least sixty million dollars. Since many new men are becoming interested in owning pure-breds it is very important for them to become familiar with the factors which determine values.

Pedigree

Pedigree is the main advantage which the registered animal enjoys over the grade. In the first place the pure-bred as a rule is more productive. Not only is a man willing to pay for the prospective milk returns of the individual but he will often pay several times more than this for the prospective transmitting powers of the well bred animal. This influence can be carried over to future generations and it is a dominant force in herd improvement. On account of this influence upon the progeny more money should be paid for a bull than for a female of the same breeding, the bull being able to transmit his qualities to many more progeny. This of course depends upon the desirability of the bull for a herd header and the demand for bulls. Careful breeders, however, do not lose sight of the importance of the good mother. At a recent sale a man who was much pleased with a bull so remarked to one of the most successful breeders in this country, who replied, "Yes, he is very nice but I knew his mother."

Grades sell almost entirely upon unofficial records, or more generally upon their looks. For this reason they will sell better when fresh if they have a good udder development. The highest price for a Holstein grade cow that has been recorded is a little over $500 in California. The highest price for a pure-bred Holstein cow is $30,000. This was paid at the National sale of 1920. Of course this pure-bred will not produce sixty times as much as the grade; it is doubtful if she will produce twice as much. The difference in price in this case is largely due to breeding.

Advanced Registry

Originating just previous to 1900 the Advanced Registry system has developed into a large institution in the affairs of the cattle breed associations. Previous to 1900 a few cattle were tested privately but most of the records were churned butter tests as the Babcock test was not in use until after 1890. Some of the records made were splendid but, as there was no reliable check on them, the public gave them little credence. The Babcock test has greatly simplified record work and increased the reliability of the records. Seeing the value of the record of production for breed and herd improvement, but realizing the weakness of private records in the eyes of the public, some far sighted breeders, through their breed association, enlisted the aid of the state experiment stations as a disinterested party to conduct their tests. Since the inception of this work more than 15,000 yearly tests have been made, over 50,000 short time tests are recorded; and about 20,000 cows are at present under test.

Like most big things of value the Advanced Registry system has weaknesses. Its greatest faults are that many splendid cows, or even whole herds, have never been put on test, and that some of the inferior progeny are either not tested or are not accepted because of failure to make the required production.

Properly interpreted, the Advanced Registry is now recognized as the greatest of all institutions for herd and breed improvement. Great strides have been made in twenty years through the selection of better breeding animals, in feeding and in their care. Yearly records are more reliable as a rule although with one breed seven-day records are very largely relied upon. In the short time record more emphasis should be placed upon the milk than upon the fat yield, although breeders have not always taken into consideration that the fat yield is more abnormal, and therefore less indicative of actual ability than the milk produced.

The Advanced Registry record is unquestionably a big factor in price determination, not only of the cow herself, but of her progeny and all near relatives. With production records as a basis, prices that a few years ago would have been considered fabulous are now common. One bull has sold for over $100,000, a half dozen have sold for over $50,000, and perhaps more than a score have sold for $25,000 or over.

But how has the Advanced Registry influenced the ordinary breeder? One man in Pennsylvania says that he sold a bull calf for $25. He then tested the dam, she making 585 lbs. of milk and 25 lbs. of butter in seven days. The next calf, a full brother, he sold for $150. Another man bought some pure-breds and was glad to get rid of the bulls at $50 each. When the cows were tested the demand and price both materially increased. When the daughters of the tested dams came into milk and were tested their bulls sold for still more, averaging $190 for the year 1919. This man says he made a mistake in not buying heifers from tested cows to start with as it gives a better pedigree, one of known merit further back.

A number of Holstein sales were reported in 1919 as follows:

Cows without records—$150 to $250	
Up to 22 pounds butter weekly	$ 300
22.5 to 27.5 " " "	436
27.5 to 32.5 " " "	960
32.5 to 37.5 " " "	1,950
9 over 37.5 " " "	10,100

Some sales of Jerseys at Waterloo, Iowa, follow:

Year of sale	Cows tested	Not tested	Difference
1911	$	$ 161.61	$
1912	235.71	198.19	36.52
1913	320.00	203.47	112.53
1914	323.00	173.13	149.87

Twenty-one Guernsey sales in 1919 as reported from 10 states:

121 females with records	$1,255
183 females without records having A. R. dams	607
435 females without records and without A. R. dams	438
4 bulls with A. R. progeny	2,240
85 bulls with A. R. dams	740
56 bulls without A. R. dams	193

An Ayrshire sale reported from New York follows:

5 cows with A. R. records average	$1,945
40 cows with no A. R. records average	154
12 animals with A. R. dams	376
39 animals, dams not tested	107

It is safe to assert that Advanced Registry records increase the value of cows and their progeny from 25 to 200%. The better the records and the farther they go back in a continuous line, the better. The greatest emphasis is placed upon the first two generations, however.

Private records or cow testing association records do not add greatly to the value of the pure-bred, especially outside of its own locality. Cows not tested should be sold when fresh to show best evidence of their productive capacity.

Individuality

The animals possessing good breed type and conformation always command the highest price. It is not alone desirable that they have good records of production back of them

COW STABLE, TILE SILOS, MANURE PIT, NEW STORAGE BARN, AND BULL BARNS AT THE CONNECTICUT AGRICULTURAL COLLEGE

GRASSLAND COMET, SELLING FOR $1,800 IN THE MOCK AUCTION DURING FARMERS' WEEK AT THE CONNECTICUT AGRICULTURAL COLLEGE. FOUR HUNDRED PEOPLE WERE PRESENT

DORINDA STORRS DE KOL, SOLD FOR $2,750 AT THE MOCK SALE

She produced 18,523 pounds milk and 624 pounds fat as a 4-year-old. Her dam has 22,041 pounds milk and 807 pounds fat and her maternal grandam has 23,176 pounds milk and 831 pounds fat. All bred by the Connecticut Agricultural College.

THE DAIRY FARMER HAS MANY USES FOR MECHANICAL POWER. HE PLOWS, CULTIVATES, HARVESTS, THRESHES, PUMPS WATER, GRINDS FEED, FILLS SILO, AND THERE ARE AN INFINITE VARIETY OF USES FOR THE GAS ENGINE

LEAKS IN THE TRACTOR ENGINE

R. U. BLASINGAME, Pennsylvania College of Agriculture

UNDOUBTEDLY, dairy farming is one of the most remunerative, most attractive, and at the same time most exacting lines of farming in the United States today. There are no particular rush seasons on the dairy farm. Every day requires special attention if this line of farming is to pay its maximum returns. It is true that the dairy farmer is one of the greatest users of mechanical power. It is, therefore, right and proper that a discussion of the repair of the gas tractor be a consid-

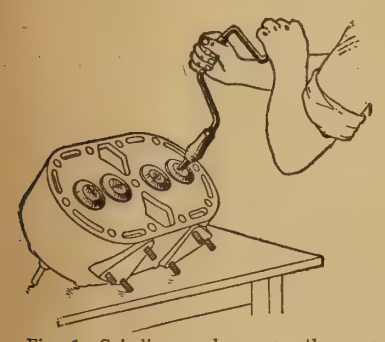

Fig. 1—Grinding valves on the gas tractor.

eration on the "work-of-winter-on-the-dairy-farm" calendar.

Why should the dairy farmer be one of the greatest users of farm power? In the first place his income is in cash every week or so, therefore the risk and interest accumulation on borrowed money for purchasing mechanical power is not necessary for this type of farmer. He has to grind, shred, and crush feed every few days. The dairy farmer uses a great deal of straw and he generally does his own threshing. The dairy farmer generally has several silos to fill which takes power; he has a water system to furnish his cows with an ample supply of clean, fresh water which requires power. The dairy farmer often uses power for milking purposes. A great many dairy farmers use motor trucks for transporting milk and cream to market. Besides all of these uses of power, he has the usual round of farm work such as plowing, clod crushing, distribution of manure and fertilizer, planting and sowing seeds, cultivation of crops, the harvesting, hauling and threshing of crops, grinding, shredding, and elevation of the products of the farms, etc. All these require machines and the efficiency of these machines depends almost directly upon the amount of speed, strength, and reliability of the power unit which operates these machines. In 1910, one man was able to harvest about 12 acres of grain per day with a binder and a team. In 1920, one man was able with the same binder attached to a gas tractor to harvest 25 to 30 acres of grain per day. This is merely one example of what one man is able to do with an efficient machine operated by an efficient power unit. This man is able to triple the amount of work which he is able to do per day, thereby tripling his income.

When the time of seeding is right and when the time of cultivation, harvesting, etc., is right, every minute during the day counts for a great deal in insuring a particular crop. It is, therefore, highly desirable that the gas tractor which is used for so many purposes about the dairy farm should be in excellent working order every day.

As a general rule, the motor of the gas tractor requires more attention probably than any other part of the machine in order to keep it ready for the various jobs alluded to above. One of the greatest difficulties with the gas tractor truck and automobile comes from leaks at the spark plugs, at the valves, at the cyclinder head gasket and between the piston and cylinder walls. If a man operates a tractor which cost $1,200, the interest on this at 6% is $72. If this tractor begins to lose power on account of leaks about the motor as have been mentioned above, the interest on his investment immediately becomes greater. If there is a leak between the piston and cylinder, on every intake stroke of this piston air will have a tendency to leak into the combustion chamber, thereby weakening the explosive mixture to the point that the gas will not explode, or if it does explode will weaken its energy materially. If this were the only loss in a leak of this kind, it would be more tolerable; however, this same leak on the compression stroke will cause a loss of the power giving gas and air mixture which has been prepared at the carburetor. This leak will also cause a loss of the explosive power of the mixture. It is, therefore, highly important to keep the gas tractor motor as air tight as possible at the various joints where leaks may occur.

It is an easy matter to remedy the leaking spark plug by installing a new one or repairing the one which may leak. It is also an easy job to repair the gasket between the cylinder and the cylinder head by removing the head and repairing the old one, or installing a new gasket.

The matter of leaking valves may be remedied by grinding them in. Grinding valves is an easy job if a few fundamentals are adhered to. The first of these is to be clean about this job; that is, when the grinding process is over every part of the valves and the cylinder which has come in contact with the valve grinding material should be thoroughly washed with kerosene or gasoline. The valve grinding material which is generally employed has very rapid grinding qualities and a small particle left on any moving part may cause that part to be damaged beyond repair in a short time. Another requirement in valve grinding is to only oscillate the valve about one-fourth of a turn with the brace and screw driver bit as seen in the illustration, Fig. 1, and as the valve grinding material grinds very rapidly it is only necessary to put a small amount of pressure against the valve when grinding. Valve grinding material comes in a box that is generally divided into halves, coarse material in one end and fine material in the other. The coarse material should be used first until all of the pits and dark spots are ground out of the valve and valve seat at which time this should be entirely washed off and the fine material used for polishing up the job. While grinding the valve, it should be only oscillated about one-fourth of a turn for about ten or twelve times, then it should be raised entirely off of the seat and turned about one-fourth to one-half of a turn and oscillated again. This process should continue until the valve is smooth. The valve should be replaced and a little grease applied to the valve guide to keep the valve from sticking when it is in operation.

If a leak develops between the cylinder wall and the piston, one of three things may be the trouble: first, the rings may be worn; second, they may be stuck in the piston grooves; or, third, the rings may be broken. One may easily determine the trouble by removing the piston from the cylinder and then removing the piston rings from the piston. It is rather a particular job to remove a piston ring from a piston without breaking the ring. If one attempts to pry the ring from the piston with a screw driver and remove it by main strength and awkwardness, the ring is likely to be broken or slightly ruptured at a point opposite the opening in the ring. The ring may be removed as shown in Figure 2, by the use of three pieces of tin, cut from a tomato can. One piece of tin is placed under the ring opposite the opening and the other two pieces placed near the opening as shown in the illustration. In this way the piston ring may be removed without difficulty and without any damage to the ring. If the rings are worn or broken, they should be replaced with new ones. Very often new rings are a little bit rough and sometimes are slightly too wide to fit freely in the groove on the piston. In this case the rings should be ground down as shown in Figure 4. A small amount of valve grinding material is placed upon a glass plate and the ring moved around on this valve grinding material on the glass plate until all rough places are removed and the ring fits loosely in the piston groove. Sometimes, it requires considerable pressure on the ring to cause the sufficient grinding to reduce the size. When the ring has been ground to fit the groove and before it is placed on the piston, it should be fitted in the cylinder. If the ring is shoved into the cylinder and if it is too large for the cylinder, the two ends will come together and have a tendency to overlap slightly. In this case, a file should be used to reduce the length of the ring by filing down its ends at the joint. When the ring has been fitted to the cylinder and to the piston groove, it should be placed on the piston, using the three pieces of tin just as in removing (Fig. 2).

If the piston ring is in good shape and it is losing compression because of being stuck in an accumulation of grease and carbon in the groove, the grease and carbon may

PACIFIC LIVE STOCK SHOW

THE tenth annual Pacific International Live Stock Exposition distinguished itself by bringing together one of the largest, if not the largest, shows of live stock ever held in this country. Its growth has been phenomenal. The new building, used for the first time in 1919, was altogether too small to house the flocks and herds that were seeking distinction. Large tents were brought into use and it was reported that more than 3,500 head of cattle, horses, sheep, and swine were on exhibition and of which there were about 815 head of dairy cattle. This was a larger number of dairy cattle than was shown at the National this year.

From the standpoint of entries and quality of animals exhibited, the Tenth Pacific International Live Stock Exposition was a large success and so far as we could observe the attendance of breeders and dairy farmers was very good. The ringside at all times was crowded with persons interested in the placing of animals and anxious to learn all they could.

The western breeders may well be proud of the showing they made, for not only were these large classes but the quality was excellent. The dairy cattle would be a credit to the National and there were classes which have never been equaled in the show ring of this country. The get of sire in the Holstein class had thirteen entries and a more uniform, typy class, backed by high yearly records, has never been presented to the public. The only dairy breed that did not have a large representative of choice animals was the Ayrshire, but it should be said that every breed had a few animals on exhibition that could have been left at home and a few bulls that belong in the hands of the butcher.

It should be borne in mind that many of the exhibitors are not professional showmen but come with their cattle to learn their defects and to train themselves to understand the proper type animals to breed. All these men were benefited by the show and we predict that next year there will be fewer animals of the undesirable type. The Pacific States have splendid producing cattle as their records show, but some breeders have not appreciated the necessity of breeding for beauty of form, uniformity of type as well as for large production. It would seem that some have not conceived the proper dairy type, but had a chance to observe great dairy animals and of good conformation which is held to be desirable by the best informed breeders. Herein lies the value of the show ring.

The West grows large and well developed cattle and the splendid records which have been made lead us to believe that the Pacific Coast States will be looked upon as one of the great breeding sections of our country and that breeders elsewhere will be seeking the blood developed in this section. It would seem that there must be something in the feed, some element or elements which are highly desirable for the proper development of dairy cattle. The climate is admirable for dairy stock. The extremes of heat and cold are not so great here as in the Central West and East. In other words, natural conditions are well suited to the dairy cow.

The Pacific International is preeminently a live stock show, and there were only a few exhibits of machinery and dairy equipment which are prominent features of the National. The several dairy breed associations had their booths and there were a few educational exhibits. In time this part of the exposition will be developed as there is need of educational demonstrations, displays of machinery, and dairy equipment. The splendid progress which the Pacific International has made shows that the men back of it have a vision and an understanding of what is essential to develop the live stock industry of the Pacific States. Special credit is due to Mr. O. M. Plummer, secretary and general manager of the show, as to him the credit is given as being a good "beggar" and the result is a large and well appointed show building. He not only has the faculty of getting men to subscribe their money, but is a capable and congenial manager which is essential in the successful development of an enterprise of this character. He has been able to unite the breeders and business interests of Portland to support and work for the development of live stock in the Pacific Coast States and he has succeeded.

Ayrshires

The Ayrshire exhibit was not up to its usual standard. We look to the Ayrshire to present the most uniform type of animals, but this cannot be said of those shown at the Pacific International. The mature cows shown by VanTassel of Washington were good, but his younger stock lacked in type and many were not in show condition. It may be said that there were a number of very good Ayrshires among the younger animals, but their poor fitting and development did them injustice. Willowmoor Peter Pan 25th, senior and grand champion, is a bull of great dairy qualities and has proven himself a good breeder. He was an easy winner in his class. The total number of Ayrshires exhibited was 59. The Ayrshires were judged by John L. Smith, Washington. The awards are as follows:

Bull 3 years or over—1, E. W. Van Tassell, Washington, on Willowmoor Peter Pan 25th; 2, E. B. McFarland, California, on Steybrae Improver; 3, W. J. Domes, Oregon, on Belle's Triune. Bull 2 years and under 3—1, Washington State College on Queen's Scottish Cavalier. Bull 1 year and under 2—1, McFarland on Ayrmont; 2, Domes on Grand Champion Washington State Fair. Senior bull calf—1, State College of Washington on Chinook Peter Pan Ben; 2 and 4, Van Tassell on Wenatchee Robin Hood and Stewart of Wanatchee; 3, McFarland on Steybrae Ayrmont. Junior bull calf—1, State College of Washington on Chinook Cavalier Caddy; 2, McFarland on Steybrae Inuchy; 3, Van Tassell on Stewart Robin of Wenatchee.

Cow 4 years or over—1 and 4, Van Tassell on The Belle of Wenatchee and Lady Bruce of Wenatchee; 2, McFarland on Willowmoor Vista 4th; 3, Domes on Beauty Barboigh of C. H. A. F. Cow 3 years and under 4—1, Van Tassell on Bruce Belle of Wenatchee; 2 and 3, McFarland on Steybrae Grace Darling and Steybrae Ellen; 4, Domes on Happy Clent. Heifer 2 years and under 3—1, McFarland on Steybrae Nona; 2, Domes on Dolly Edgewater; 3, Van Tassell on Queechie of Wenatchee. Junior yearling heifer—1, McFarland on Steybrae; 2 and 3, Van Tassell on Lady Scott of Wenatchee and Scottish Queen of Wenatchee; 4, Domes on Ben Hur Sadie Netherall. Senior heifer calf—1 and 3, McFarland on Steybrae Happy Girl and Steybrae Vista; 2, Van Tassell on Lady Bruce of Wenatchee 4th; 4, Domes on Happy Daisy. Junior heifer calf—1, McFarland on Steybrae Darling; 2, 3, and 4, Domes on Miss Sentinel Fjalyston, Ben Hur Saide Netherall 2nd, and Belle of C. H. A. F.

Exhibitor's herd—1, Van Tassell; 2, McFarland; 3, Domes. Young herd—1, McFarland; 2, Van Tassell; 3, Domes. Calf herd—1, Domes. Produce of cow—1, McFarland; 2 and 3, Van Tassell; 4, Domes. Get of sire—1, McFarland; 2 and 3, Van Tassell.

Senior and Grand Champion bull—Willowmoor Peter Pan 25th. Junior champion bull—Chinook Peter Pan Ben.

Senior and grand champion cow—The Belle of Wenatchee. Junior champion cow—Steybrae.

Guernseys

There was deep interest and keen competition in the Guernsey classes. The admirers of this breed were not disappointed in the showing it made, for in every class there were many splendid type animals backed by creditable yearly records. In the mature class of cows nine animals were shown. Wilson's Pet won first and grand champion. She is an unusually well developed cow and has an official record of 648 lbs. fat in a year and is in the AA class. Her head was plain, and she is a little u-necked, but outside of this she was hard to fault. In the essentials she is highly developed. Veda's May King of Edgemoor was grand champion bull. He is an animal of splendid breeding and a son of Itchen May King, a bull that has won many laurels in the show ring. The bull, Jolly Fermain, contender for grand champion, is an animal of great dairy qualities, but did not have quite the quality of refinement as did his contender, Veda's May King. Both bulls had their following, but when the judge placed the purple ribbon on Veda's May King it seemed to meet the approval of the ringside critics.

The exhibitor which received the most comment on his exhibit was W. A. Goodin of Oregon. He showed ten head and he only owns twenty in all. He won three firsts, two seconds, two thirds, and one fourth, and a grand championship on Wilson's Pet. His second cow, Yeksa Snowdrop, has a record of 806 lbs. fat and his heifer, Yeksa Queen of Rose City, won first in the two-year class and has a record of nearly 600 lbs. as a senior yearling. His herd is noted for records and type and this is what every breeder should seek. It must be remembered his competitors had splendid animals and each one could well be given special mention, but space does not permit. Mr. Goodin, being a small breeder and winning so many prizes in keen competition and with animals of good records, gives opportunity to drive home what constitutes good breeding.

It was most fortunate for the Guernsey that the judge, Mr. Hope, of New Jersey, passed on their cattle for he holds fast to characters which indicate production, but does not neglect type and the characteristics essential to the Guernsey breed.

The awards follow:

Bull 3 years or over—1, Watson and Hunter, Oregon, on Jolly Fermain; 2, A. I. and J. Hughes, Oregon, on Red Wing's Monogram Sequel; 3, F. H. Stangel, Oregon, on McDonald's Makefield Prince; 4, A. L. Gile, Washington, on Chicona Buster. Bull 2 years and under 3—1, H. E. Angel, Washington, on Rex of Willow Brook; 2, W. A. Goodin, Oregon, on Langwater Khedive. Senior yearling bull—1, Winsor Ranch, California, on Veda's May King of Edgemoor; 2, Gile on Chicona Lover Bold; 3, John Berns, Oregon, on May Rose Count; 4, R. Zweifel, Oregon, on Tillamook Buster. Junior yearling bull—1, Gile on Chicona Corsair; 2, Stangel on Red Wing Jennie Van's May Rose Yeksa Starlight; 3, R. McClay, Oregon, on Fern's Glen; 4, J. Durrer, Oregon, on Red Wing's Model's May Rose Starlight. Senior bull calf—1, A. M. Smith, Washington, on Woodvale Radium; 2 and 3, Gile on Chicona Peter and Chicona Luesta; 4, Goodin on Duke of Midvalley. Junior bull calf—1, Gile on Chicona Viking; 2, W. Harvey, Oregon, on Royal Knight of Imp. Beauty; 3, Hawley and Son, Oregon, on Landon's Lad; 4, Angel on Starlight of Ruby Dell.

Cow 4 years or over—1 and 2, Goodin on Wilson's Pet and Yeksa Snowdrop; 3, Gile on Lucilla of Chicona; 4, Hughes on Modele's Jolly Lass. Cow 3 years and under 4—1, Angel on Raider's Minie of Muskego; 2, L. G. Perry, Idaho, on Edna of Mt. View, 3, H. Mason, Oregon, on Butternut Bessie of Fairlea; 4, Smith on La France of Bralee. Heifer 2 years and under 3—1, Goodin on Yeksa Queen of Rose City; 2 Jewel of Rose City; 3, H. W. Bateman, Washington, on Kulshan Hayes May Rose 2d; 4, Gile on Linnie of Chicona. Senior yearling heifer—1 and 2, Gile on Marjorie of Chicona and Helen of Chicona; 3, Goodin on Governor's Yeksa Hope of Rose City; 4, Angel on Sweet Dame of Muskego. Junior yearling heifer—1, Goodin on Jasmine of Rose City; 2 and 4, Mason on Julia's Alma of Few Acres and Ethel's Evangeline of Few Acres; 3, Hughes on Red Wing Starlight's Gypsy. Senior heifer calf—1, C. Ringo, Oregon, on Clearbrook Starlight's LePort; 2 and 3, Gile on Pride's Peggy of Chicona and Pearl of Chicona; 4, Hughes on Red Wing Doctor's Phillipa. Junior heifer calf—1 and 2, Gile on Lustre of Chicona and ——; 3, Goodin on Dairymaid of Rose City; 4, Mason on Beth's Rosette of Few Acres.

Exhibitor's herd—1, Goodin; 2, Gile; 3, Angel; 4, Hughes. Young herd—1 and 3, Gile; 2, Goodin; 4, Mason. Calf herd—1, Gile; 2, Mason.

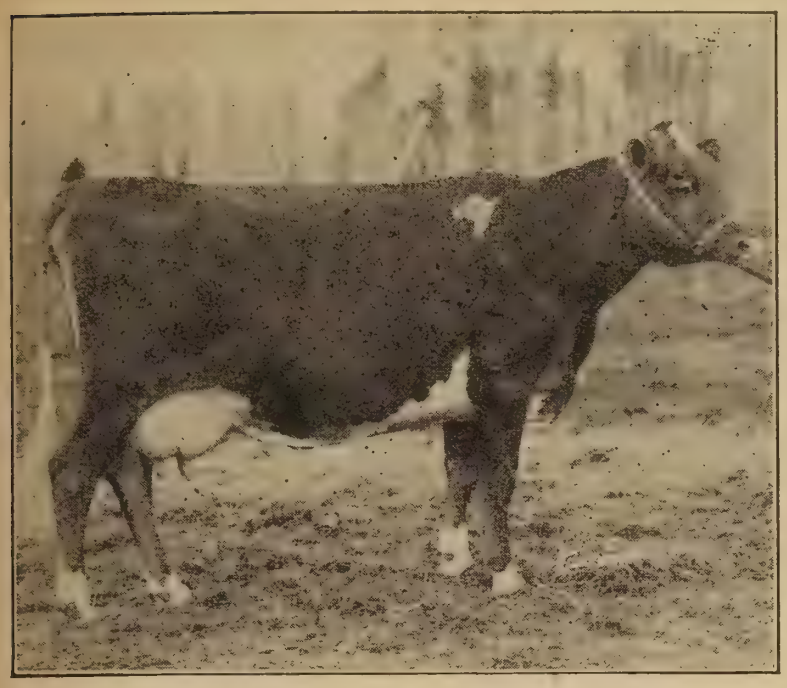
Senior champion bull—Jolly Fermain, junior and grand champion bull—Veda's May King of Edgemoor.

Senior and grand champion cow—Wilson's Pet. Junior champion cow—Marjorie of Chicona.

Holsteins

This breed made a very fine showing and especially with its younger animals. We believe no greater display was ever made with any breed or at any exposition than that made in the get of sire class. There were thirteen entries in all and a more uniform type and well developed lot we have never seen and Mr. Moscrip of Minnesota, their splendid judge, said it was the best class he had ever seen, numbers and everything considered. The get of the noted bull, Judge Segis of Hollywood Farm and Matador Segis Walker of Carnation Farms, were the chief contenders in this great class. The get of Matador won 1st and 3rd and that of Judge Segis 2nd. But the owners of the other bulls, which won top places with their progeny, need not be discouraged for it was an honor to have recognition in tenth place.

There were ten bulls shown in the aged class and they made a fine exhibit. Matador Segis Walker 6th, owned by J. L. Simpson, Oregon, won first and later senior and grand champion. He is a remarkable bull; has great quality and a fine system of veins which stick out all over. He has refinement and good dairy qualities and was the easy winner notwithstanding he is only three years old, and that is against him, especially in a class of bulls noted for show ring successes. Hollywood Farm's noted bull, Judge Segis, had to take 3rd place as he is 10 years old and age has begun to show itself. He did not show his usual form in body and the bull that won second was exceptionally good in this respect, especially in depth of body. Merci Lad Korndyke Burke, winner of second, is a bull of not only good depth and length of body, but of high refinement, especially in the head. He was a little too fat and heavy in shoulders and in hind quarters, not well cut up in thighs.



The aged cow class was not exceptional; rather common for so large a showing of Holsteins. Mutual Clothilde Segis Walker was senior and grand champion. She is an exceptional cow, or rather heifer, and by the famous bull, Matador Segis Walker. Her system of veining is simple and teats a little small and close together, but outside of this she is nearly a perfect individual. She has a record for 10 months as a senior yearling of 17,021 lbs. milk containing 561.6 lbs. fat so her veining is sufficient to supply her udder with nourishment for making milk even though it scarcely measures up to the ideal.

Winnifred Hengerveld Walker was junior champion and a great heifer. Matador Segis Walker's progeny won 10 firsts out of a possible 18, and grand champion male, grand champion female, and junior champion female. Junior champion bull was Chi-

Weigh Your Feed— Weigh Your Milk

That's the way to put your dairy on a business basis—find out exactly how much you are feeding each cow and exactly how much milk she is giving. It has been our advice to dairymen for eleven years.

Pick out one cow—any cow you choose—and let the gain in her milk yield prove how cheap Larro really is.

If you don't get more milk than before, and if you don't make more profits from Larro (never mind what you paid for it), take the two empty sacks and any Larro you have left back to your dealer and get your money back.

Write for names of Larro users in your neighborhood and your nearest dealer.

The Larrowe Milling Co.

203 Larrowe Bldg., Detroit. Mich.

Association Notes

Laurel Hill, Pennsylvania:—During September 3% market milk sold for $3.61 per cwt. and 4c per point above. The creamery paid 72c per pound for fat. Feed prices were: Gluten, $52 per ton; bran, $50; oil meal, $70; Tioga Dairy Feed, $77; ground oats, $55; corn meal, $3 per cwt.

Towanda—Wilmot, Pennsylvania:—Three per cent milk sold for $3.33 per cwt. in September. Tioga Dairy Feed sold for $3.95 per cwt.; wheat bran, $3; cottonseed meal, $3.50.

Canton, Pennsylvania:—A number of the members are connected with the local Holstein bull association. This association has recently received four well bred bulls which were purchased last spring for fall delivery. Conditions have made it difficult to dispose of surplus stock, but it is believed the market will improve later this autumn. The refusal of the manufacturers to purchase milk has affected a number of our members, but the majority either sell fluid milk or patronize the local creamery. Three per cent market milk sold for $3.65 in October. The creamery paid 69c per pound for fat. Milk retails for 14c per quart and butter for 65c per pound. Feed prices are: Cottonseed meal, $72; oil meal, $72; gluten, $58; corn meal, $56; ground oats, $56; hominy, $62; Unicorn Dairy Feed, $76; wheat bran, $54.

McGregor, Iowa:—This association purchased a carload of cottonseed meal at $63 in October. The McGregor Association had the high grade herd average of the state last year and the same herd is making good progress this year.

Sullivan, Ohio:—The high cow for October is owned by A. C. Snoddy. This cow produced 52.06 lbs. fat in 1,407 lbs. milk. The seven other cows which produced more than 40 lbs. of milk are owned by the same dairyman.

Empire, Wisconsin:—October milk sold for $2.50 per cwt. at the condenseries and butterfat sold to the creameries for 60c to 68c per pound. Feed prices are as follows: Silage, $8 per ton; alfalfa, $24; bran, $40; oats, $30; barley, $40; oil meal, $70.

Rock Prairie, Wisconsin:—Five pure-bred Holstein cows were purchased during November. Two cars of alfalfa hay have been bought. Market milk testing 3.5% sold for $3.05 per cwt. and 4c per point above. The retail price of milk is 14c per quart; butter, 69c per pound, or storage, 64c; and cheese, 38c per pound. Bran is rated at $36 per ton; oil meal, $68; barley, $1.90 per cwt.

Rockfield, Wisconsin:—The association has purchased two carloads of bran at $35 per ton, one carload of oil meal at $68 per ton, and one carload of gluten at $44 per ton. September market milk testing 4% sold for $2.80 per cwt. and 6c per point above.

Macoupin County, Illinois:—This association has no scrub sires and has five 100% pure-bred herds. A carload of hominy feed and linseed oil meal has been bought co-operatively. Milk sold for $3.75 per cwt., a test of 3.6% being required and 5c paid for each point above. Feed prices are: Bran, $2.25 per cwt.; hominy, $3; linseed oil meal, $3.40; malt, $3.35; corn, $1.16 per bushel; oats, 75c per bushel.

Weiser—Payette Co-operative, Idaho:—Several unprofitable cows were disposed of during October. Milk testing 3.4% sold for $3.75 per cwt. The creamery paid 60c per pound for fat. Milk retails for 14c per quart, butter for 65c per pound, and cheese 38c per pound. Feed prices are as follows: Rolled barley, $2.90 per cwt.; linseed, old process, $90 per ton; soy bean meal, $79; molasses meal, $59; bran, $48; ground corn, $2.60 per cwt.

McCracken County, Kentucky:—Three unprofitable cows were sold to the butcher during the month of October. A carload of 41% cottonseed meal was bought co-operatively by the dairymen and cattle feeders of the county through the farm bureau. The price quoted by feed merchants in Paducah was $63 per ton and the carload was bought at $44 per ton laid down in Paducah. Dairymen received $4.50 per cwt. for 3.6% milk and 6c per point above this test. The creamery paid 57c per pound for fat. Milk retails for 17c per quart and butter for 70c per pound. Silage is rated at $8 per ton; cottonseed meal, $44; bran, $42—$44; sorghum hay, $15—$18; clover and red top, $22.50—$25; mixed feed (mill run), $50; soft corn, 55—60c per bushel.

Effingham County, Illinois:—Two unprofitable cows were sold and two pure-breds purchased during October. The members are giving up the use of commercial feeds and are mixing their own rations from home grown feeds. The result is a much better feed at a cheaper cost. For milk testing 3.5% dairymen received $3.55 per cwt. and 4c per point above this test. The creamery paid 50c per pound for fat. Milk retails for 15c per quart and butter for 65c per pound. Feeds are listed as follows: Corn, $1 per bushel; oats, 73c; bran, $2.10 per cwt.; cottonseed meal, $3.40; oil meal, $3.50; Purina Cow Chow, $3.50; alfalfa, $32 per ton; silage, $7 per ton.

Wilson County, Tennessee:—October feed prices are as follows: Schu-

macher, $63 per ton; cottonseed meal, $60; bran, $45; Dairy Feed, $50; silage, $5; oats, 75c per bushel; pasture, $1 per month. The creamery paid 58c per pound for fat during the month.

Douglas County, Colorado:—About forty cows were sold during October. Several members plan on purchasing cows in the near future. The average production per cow for October was 536.5 lbs. milk containing 20.8 lbs. fat. Feed prices are: Alfalfa, $16 per ton; silage, $8; bran, $2—$2.35 per cwt.; linseed, $3.60—$4; oats, $2—$2.90; barley, $2.20—$3; corn chop, $2—$3.

Johnston, Colorado:—Rocabie, a pure-bred Holstein owned by W. A. Purvis, is high cow in the association and in the state this month. She produced 1,903 lbs. milk and 80.7 lbs. butterfat. Brown Bros. have the high herd, averaging 40.8 lbs. fat and 1,009 lbs. milk. The average production of the association per cow for October was 801 lbs. milk containing 30.4 lbs. fat. The condensery paid 65c per pound for fat. Milk retails for 14—15c per quart. Feeds are rated as follows: Alfalfa, $10—$13 per ton; silage, $6—$8; beet pulp, $1.75 per cwt.; bran, $1.90; cottonseed meal, $3.50; linseed meal, $4.40; oats, $2.30; barley, $2.20; corn chop, $2—$2.60; maize, $2.80.

Platte, Boulder, and St. Vrain Valleys, Colorado:—The average association production per cow for October was 24.5 lbs. fat in 598 lbs. milk. Twelve cows produced over 50 lbs. fat. The creamery paid 75c per pound for fat and the condensery paid 65c per pound. Milk retails for 14—15c per quart. Feed prices are: Alfalfa $8—$12 per ton; wet beet pulp, $2 per cwt.; bran, $2.05—$2.25; cottonseed meal, $4; linseed, $4.50; oats, $2.75; barley, $2.50—$2.75; corn chop, $2.30—$2.75.

Arkansas Valley, Colorado:—Three members have purchased bull calves for their herds. The Prowers County breeders and Lamar bankers have placed a hundred choice heifers with reliable farmers. The association average per cow for October was 516 lbs. milk containing 16.9 lbs. fat. The September average was 433.4 lbs. milk containing 15.5 lbs. fat. Milk testing 3.5% sold for $2.75 per cwt. in October and 5c per point above this test. Feed prices are: Alfalfa, $7—$10 per ton; beet pulp, $2 per cwt.; bran, $1.35; cottonseed meal, $3; linseed, $5; barley, $1.40; corn chop, $1.85; maize, $1.50; shorts, $2.75.

Geauga County, Ohio:—During October 3.5% market milk was sold for $3.35 per cwt. Gluten is rated at $2.50 per cwt.; bran, $2.10; oil meal, $3.25; hominy, $2.50.

Dairying Thirty Years Ago

Taken from the Issue of Hoard's Dairyman of December 12, 1890

In answer to the question—"How many pigs can be kept to a cow?" Col. F. D. Curtis, of New York, who is a very successful dairyman and pig raiser, replies as follows:

"The old rule was one. It depends somewhat on the cow. I say three, because no farmer can afford to give a pig nothing but milk. The milk is worth too much as an aid in the digestion of solid foods and in making succulency, which is an important part of a successful system of feeding. So I say add enough bran, middlings, linseed meal, and corn meal or other meal to the milk and keep three pigs to a cow, and so make valuable manure and more pork."

A Big Family of Milk "Cranks"

HOARD'S DAIRYMAN:—I have twelve living brothers and sisters—all milk cranks. Their first meal on earth was milk, and I believe they will call for it about the last thing. The youngest is over 40 years old.

Father, fifty years ago, gave milk as a medicine. The doctors said he was crazy on the subject of milk. I do not think a doctor was called in twenty years for one of those thirteen children. Rice mush, samp, johnny cake, sweet apples, etc. were served with milk, some of them every day in the year. A fever was not expected or feared. Some of us would occasionally have the stomach ache, but we would lay across a rail fence a few minutes and go to work again. Impure or diluted milk was not thought of or feared, fifty years ago, in the highlands of the Hudson. It was as pure as the water that bubbled from a thousand springs.

If I was threatened with fever, if I could not break it with nicely loppered milk I should send for a notary—or a preacher. Rheumatism can be driven from the blood with buttermilk as easy as driving a pig to market.

I chewed tobacco seventeen years and drank some beer. I have quit them both and take milk instead, and feel better.

When milk is fully understood—and the time is coming speedily—people will never die—not from disease.

A glass of beer, father, will buy your dear family a quart of milk. Deny yourself your cigars for a year and take milk in their place and raise some boys that nothing less than a cyclone will kill. I wanted some advice from Dr. Clark, of Sheboygan, the other day. He says, "Can't you cure it with milk?" I have.

Wisconsin. A. X. HYATT.

⚜

At a state meeting of the dairymen of Connecticut, held the 19th ult., they resolved that an entirely new law on the subject of oleomargarine was needed, and they were unanimous in the view that it should be made the same as that of New Hampshire and Vermont on the same subject—the manufacturers should be compelled to color it pink. That, it seems, does the business as nobody yet has a stomach fixed over to crave pinky butter.

Dairymen's Remedy

Last spring I asked a successful dairy friend why he did not get more cows, as he could easily do the additional head work and his team could take a few hundred pounds more milk to the station without any more wagons or drivers than at present. He replied that he didn't want to increase his number, but was constantly increasing his milk by getting a better class of cows and already nearly doubled the quantity of ordinary dairies. His receipts for eighteen cows for the seven months ending April 30 were over $1,100. He said that with the help of one hand he could milk and feed eighteen cows with comfort to himself and the cows, but an increase of the number meant a larger stable and extra help, and he much preferred to draw the increase from the present number of udders. This idea is in the direction of progress and in the coming dairy millennium will be so universal as not to suggest a newspaper item. The common cow gives 3,000 pounds of milk per annum; the uncommon one 18,000 pounds, or six times as much. To care for three cows would only give one man healthy exercise, while eighteen, as we have seen, gives work for two. Then the accidents of maternity and of disease are reduced in the ratio of 3 to 18, as in the stable-room.—L. B. PIERCE.

These Wrappers Advertise Your Butter

YOUR butter wrappers are your own *paid* advertising space! Use them. Make them pay a profit. Use Paterson Vegetable Parchment wrappers because they not only preserve butter but make your package attractive to the butter buyer.

The sanitary, clean appearance of butter in these wrappers is a mighty factor in the final choice of the fastidious customer.

If you buy Paterson Parchment Paper Wrappers in lots of 5000 or more, we will print your advertisement on them in attractive display and positively guarantee the printing will not stain the butter.

"Pedigreed" Feed? Why Not?

Ce-re-a-lia Sweets is like a pure bred cow. Its past history is an open book and you read the future from it.

Ce-re-a-lia has made good for 8 years like this: "I strayed away for a while but can't get results I got with Ce-re-a-lia. Send me 10 tons." And this: "Increased butter yield of five cows from 18 lbs. to 32½ lbs." Thousands get results like this. So will you.

Feed One Cow Four Weeks at Our Risk. Write for details of trial offer.

THE EARLY & DANIEL COMPANY
301 Carew Building, Cincinnati, Ohio

I believe in lookin' backward as well as forward when I buy dairy feed, same as when I buy "pedigreed" cows.

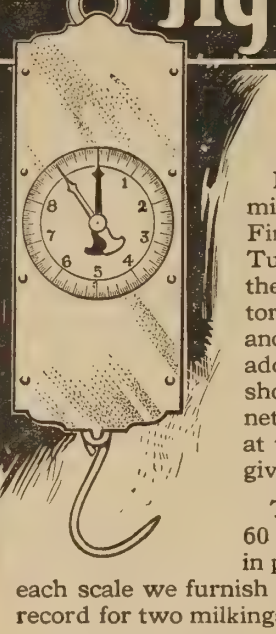
Don't Split With the Miller

Grind your own feed at home. Save miller's profit and long haul to town. Feed efficiently and economically.



HOWELL *Roller Feed Mills*

grind stock feed, rye or graham flour easily, cheaply—a wagon load in an hour at a cost of 15 cents. Grind twice as fast as buhr mills at one-half expense. No buhrs, no stones to wear out. Guaranteed to get the wild oats. Scientifically built, Last a lifetime. 13 Sizes—any capacity—a size for any engine.

FREE complete catalog and Famous Roller Mill Puzzle. Write now. R. R. HOWELL & CO, 4 Malcom Ave. S. E., Minneapolis, Minn.

When Writing to Advertisers, Mention Hoard's Dairyman

Yield of Each Cow Figured for You

By the *CP* Pail Balancing Scale

Has two indicators. Weighs the milk in the pail. Eliminates errors. First hang the empty pail on the scale. Turn the thumbscrew in the center of the dial, which moves the red indicator until it is at the 0 mark, thus balancing the weight of the pail. Then add the milk or cream and the result shown by the red indicator gives the net weight of the milk or cream, and at the same time the black indicator gives the gross weight of pail and milk.

The capacity of these scales is 30, 60 and 120 pounds, according to size, in pounds and tenths of pounds. With each scale we furnish special blanks that will contain the record for two milkings a day for one week for 14 cows.

The scale can also be used for all weighing purposes.

Price each, 30 lbs. capacity by 1-20 lb. $4.85, 60-lb. $5.65, 120-lb. $8.85. Extra records per dozen, 15c.

"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings top prices —pleasing the eye and tempting the palate.

The High Scores of 1920

In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor.
Doesn't color the buttermilk. Leaves no sediment.
Colors more butter to the gallon.

Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all Food laws—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc. BURLINGTON, VERMONT

PACIFIC LIVE STOCK SHOW

(Continued from page 914)

nook Segis Pontiac David and is owned by the Washington College of Agriculture.

The awards follow:

Bull 3 years or over—1, L. J. Simpson, Oregon, on Matador Segis Walker 6th; 2, A. M. Baldwin, California, on Merci Lad Korndyke Burke; 3, Hollywood Farm, Washington, on Judge Segis; 4, California Geo. Jr., Republic, California, on Dechuter Spofford Korndyke Lad 5th. Bull 2 years, under 3—1, Carnation Farms, Washington, on Pietertje Prospect Colantha; 2, Yakima Valley Holstein Breeders' Association, Washington, on Sir Bessie Rags; 3, Rupp on Hollywood Lilith Adventuress; 4, Wm. Bishop, Washington, on Riverview Sir Fellinga. Senior yearling bull—1, W. J. Higdon, California, on Prince Bonnie Walker; 2, Carnation Farms on Shadford Segis Hartog; 3, Bishop on Canary Paul Ormsby Poach; 4, Yakima Valley Breeders' Association on Sir Cascade Ormsby Blossom. Junior yearling bull—1, T. J. Owens, Washington, on Hollywood Veeman Segis; 2, Hollywood Farm on Hollywood Fayne Segis; 3, J. A. McCormick, Washington, on King Segis of Nooksack. Senior bull calf—1, State College of Washington on Chinook Segis Pontiac David; 2, Hollywood Farm on Hollywood Illustrites Fayne; 3, Yakima Valley Breeders' Association on Sir Ormsby Duchess Segis; 4, W. Martin, Oregon, on Aaggie Colantha Gerben. Junior bull calf—1, Yakima Valley Breeders' Association on Sir Cascade Johanna Pietertje; 2 and 4, F. R. Beals, Oregon; 3, Carnation Farms on Walker Matador Prince.

Cow 5 years or over—1 and 4, Bishop on Hazelwood Ormsby Posch 2d and Hazelwood Pietertje Jewel; 2 and 3, Carnation Farms on Bahama Cornucopia and Nena Kaan Selah. Cow 3 years and under 5—1, State College of Agriculture on Maple View Myra De Kol 2nd; 2, Rupp on Irene Countess of Somerset; 3, Bishop on Daisy Perfection De Kol; 4, A. E. Smith, Washington, on Nooksack Sundy Organdy De Kol. Heifer 2 years and under 3—1 and 3, Carnation Farms on Mutual Clothilde Segis Walker and May Walker Skylark; 2, Bishop on Chimacum Andy May; 4, Smith on Korndyke Greenback. Senior yearling heifer—1, Carnation Farms on Winnifred Hengerveld Walker; 2, D. McKeown, Oregon, on Reka Segis 2d; 3, Baldwin on Anoakia Burke Cornucopia; 4, Hollywood Farm on Hollywood Segis Phoebe Veeman. Junior yearling heifer—1, ——; 2, McKeown on Hazelwood Heilo Spofford Queen; 3, Bishop on Chimacum Mollie 2d; 4, Baldwin on Burbank Aaggie Lincoln. Senior heifer calf—1 and 2, Carnation on Carnation Colantha Ciruela and Carnation Matador Pontiac; 3, Beals on Hengerveld Burton De Kol Hartog; 4, Martin on Colantha Johanna Prilly Canary. Junior heifer calf—1 and 2, Carnation on Carnation Sylvia Queen and Carnation Matador Clementine; 3, Martin; 4, Simpson.

Exhibitor's herd—1, Carnation Farms; 2, Boner and Son; 3, Smith; 4, Bishop. Young herd—1, Carnation Farms; 2, Hollywood Farm; 3, Bishop; 4, Smith. Calf herd—1 and 3, Carnation; 2, Hollywood; 4, Bishop. Produce of cow—1, Hollywood; 2 and 4, Carnation; 3, Bishop. Get of sire—1 and 3, Carnation; 2, Hollywood; 4, Bishop.

Senior and grand champion bull—Matador Segis Walker 6th. Junior champion bull—Chinook Segis Pontiac David.

Senior and grand champion cow—Mutual Clothilde Segis Walker. Junior champion cow—Winnifred Hengerveld Walker.

Jerseys

The most difficult breed to judge was the Jerseys as the classes were not only large, but a great variation in type. Oregon and Washington are noted for their big Jerseys of large dairy capacity and vigor, but lacking in many instances in uniformity of type and refinement. The judge, Mr. Geo. W. Sisson, Jr., of New York, gave very good satisfaction and we believe selected the right animals for the ribbon class. He believes in good sized Jerseys, in type that indicates production, but with it he desires refinement and symmetry. To our knowledge he sent one animal to the barn, characterizing it as a watch charm. The aged class of cows created the most interest and brought forth the largest amount of comment. There were 20 entries and the judge said if he had 15 ribbons he would award them. This class made a wonderful showing; it had exceptional udder development and was of high dairy quality and as Mr. Sisson said "there were no watch charms among them." The people of Oregon and Washington may well be proud of their Jerseys, for there is seldom seen in a show ring twenty cows equal to these.

The blue ribbon went to Eminent's Jimp's Owl owned by Glen Tana Farm, Washington. Later she won senior and grand champion. The most striking thing about this cow is her great udder development. It seems too large for her body, but a record of 16,000 lbs. milk containing nearly 800 lbs. fat shows that her digestive and assimilative powers are well developed.

The senior heifer class was the largest at the show. It contained 33 animals and a splendid lot they were. Their development, like that of the older animals, speaks much for Oregon and Washington as being ideal states for the Jersey:

The awards follow:

Bull 4 years old or over—1, B. C. Altman, Oregon, on La Belle's Oxford Lad; 2, N. C. Sears, Washington, on St. Mawes of Grasmere; 3, F. Vincent, Oregon, Clarissa's Dulcet King; 4, P. Meenderinck, Washington, on Sunlight's Chief. Bull 3 years old or under—1, D. C. Howard and R. C. Williams, Oregon, on Captain Tristram; 2, J. M. Heldt, Washington, on Noble's Majesty of L.; 3, J. Donaldson, Oregon, on Golden St. Mawes Rosaire; 4, L. C. Daniels, Oregon, on Belle's St. Mawes Lad. Bull 2 years and under 3—1, Waikiki Farm, Washington, on Manna Lad of Waikiki; 2, Glen Tana Farm on Glen Tana Golden's Lad; 3, Ice and Spangler, Oregon, on Creampot's Fortune; 4, W. Robitsch, Oregon, on Susy's St. Mawes Apex. Senior yearling bull—1, Waikiki Farm on Count's Foxy Owl; 2, N. H. Smith, Oregon, on Picabo's Wonder Boy; 3, F. Loughary & Son, Oregon, on Leda's Golden Prince of L.; 4, F. E. Butler, Oregon, on Joy's St. Mawes. Junior yearling bull—1 and 2, Waikiki Farm on Esther Pilot of Waikiki and Bonny's Pet of Waikiki; 3, L. A. McCormack, Oregon, on Damsel Mawes Poppy; 4, V. Forrest, Oregon, on St. Mawes Bright Lad. Senior bull calf—1, McArthur & Stauff, Oregon, on Sophie's Oregon Tormentor; 2, Waikiki Farm on Waikiki's Morocco Duke; 3, Glen Tana Farm on Glen Tana Golden Boy; 4, M. C. Sears, Washington, on Champion of Midfields. Junior bull calf—1, McArthur & Stauff on Sophie's Chief Engineer; 2, Waikiki on Belle's Pilot of Waikiki; 3, A. Johnson, Oregon, on Emerald Kilches Joe; 4, Wm. M. Ladd, Oregon, on Vive Glow Senna Chief.

Cow 5 years or over—1, Glen Tana Farm on Eminent's Jimp's Owl; 2, Smith on Western King's Delight; 3, Waikiki on Mourier's Golden Maid; 4, Loughary on Eminent's Daisy of L. Cow 4 years and under 5—1, Loughary on Luckiamute's Noble Lou; 2, Altman on La Creole's Oxford Millie; 3, Howard and Williams on St. Mawes Beauty's Gertie; 4, Waikiki on Indiana Lady Diana. Cow 3 years and under 4—1, Loughary on Luckiamute's Queen Vidette; 2 and 3, McArthur and Stauff on Hood River's Lenore and Thora of Ashwood; 4, McLeod on Double St. Mawes. Heifer 2 years and under 3—1, Altman on Helier's Queen Maid; 2, C. L. Mulkey, Oregon, on Maggie of Laurchester; 3 and 4, McArthur and Stauff on Holger's Madam Butterfly and St. Mawes Hazel. Senior yearling heifer—1, Mulkey on Verna of Lancaster; 2, H. L. Weister, Washington, on St. Mawes Lady Etta; 3, B. Olsen, Washington, on Fern's Nehalem Goldie; 4, Waikiki on Pilot's Duchess of Waikiki. Junior yearling heifer—1, Mulkey on Fairy's Queen of Laurchester; 2, Altman on Helier's Lady of Ingleside; 3, Cary on Susy's Maiden Beauty; 4, Glen Tana on Glen Tana Sultan's Nelly. Senior heifer calf—1, A. Malar, Oregon, on La Coneyella; 2, Waikiki on Pilot's Trilby of Waikiki; 3, Glen Tana on Glen Tana Dorothy; 4, Altman on Empress Lass of Ingleside. Junior heifer class—1, O. P. Dosland, Washington, on Miss Pogis of St. Mawes; 2, Glen Tana on Glen Tana Morocco Lois; 3, Sears on Peggy Annabel; 4, Cary on St. Mawes Poppy 3rd.

Cow having Register of Merit record for one year to be judged on conformation only, producing 600 lbs. fat or over in tests begun at 5 years or over—1, Glen Tana on Eminent's Jimp's Owl; 2, Loughary; 3, D. Perkins, Oregon, on Rosaire Chimes; 4, J. M. Dickson & Son, Oregon, on Lulu May of Ashburn.

Cows producing 400 lbs. fat or over in tests begun at 2 years and under 5—1, Altman on a Creoles Oxford Millie; 2 and 4, Loughary; 3, Watt & Acree, Oregon, on Brilliant Jersey Queen.

Exhibitor's herd—1, Altman; 2, Glen Tana; 3, Waikiki; 4, McArthur & Stauff. Breeder's young herd—1, Loughary; 2, Glen Tana; 3, McArthur & Stauff; 4, McCormack. Calf herd—1, Waikiki; 2, Glen Tana; 3, McArthur & Stauff; 4, Loughary. Dairy herd—1, Loughary; 2, McArthur & Stauff; 3, Dickson & Son; 4, Ladd. Get of sire—1, Loughary; 2, Altman; 3, McArthur & Stauff; 4, Mulkey. Produce of cow—1, Loughary; 2, Altman; 3, Glen Tana; 4, Malar. Cow having Register of Merit record for one year, shown with two of her progeny—1, Glen Tana; 2 and 3, Loughary; 4,

4,200 Eggs From 48 Hens

Simply write me and I will send you a big triple size box of my famous **Buttermilk Compound Tablets** by return mail, postpaid. I want you to know that you can double and treble your poultry profits by doubling or trebling your egg yield—perhaps get five to seven times as many eggs as did many of my friends last winter by using these wonderful tablets. Fed in drinking water or feed. Because I want these tablets known in every township in America I say: Try them at my risk. If you like them, tell your friends. If not, you are not out a cent.

Over 10,000 People Wrote Me Last Year

Here are a few samples of the kind of letters I get from all parts of the United States.

4,200 Eggs.

I used two boxes of your tablets. Before using them got only 6 eggs a day. Within two weeks was getting 12 to 15 eggs a day. In seven months I got about 350 dozen (4,200) eggs from my 48 hens. I did not have any Roup. I give your tablets the praise.
MRS. ARTHUR TUCKER. Wilkinson, Ind.

75 Eggs Instead of None.

I found the tablets were fine to start hens to laying. Before using the tablets I wasn't getting any eggs. Within 10 days after using tablets increase started. I was finally getting 75 eggs a day and fed the tablets until spring.
MRS. R. H. TULTZ, Scranton, Kans.

Makes 'Em Lay in Coldest Weather.

Last winter I fed two boxes of your tablets mixed with feed. Before using tablets got only 12 eggs a day—afterward 30 to 36 eggs a day. This was within three weeks. After feeding the tablets six weeks got 50 and 60 eggs a day and in the coldest weather in winter.
MRS. ELMER HOTTMAN, Ridgeway, Wis.

Best Tablets Made.

The Buttermilk Compound Tablets I think are better than the common tablets. I got more eggs within two weeks after using them. I have some other tablets but the "Buttermilk" are the best. I fed three boxes last winter. My flock did not have the Roup. Will send for more tablets.
MRS. WALTER ELLIS, Gypsum, Kans.

FREE

Because I want one million new users of these wonderful tablets I am willing to send you a big triple size box if you will just write me. Your name and address is all I need. Use a postal card if you wish—I'll send the tablets by return mail, post paid. You use the tablets 30 days then report results to me. If you are not satisfied in every way—if you are not more than pleased—the tablets are to cost you nothing. But if you do find that you get many, many more eggs—probably three to five and even seven times as many—and your flock is healthier than ever before—full of pep and strutting around with healthy red combs—the tablets cost you only $1.00. No matter what you have tried before, I want you to remember that my secret formula is absolutely different from anything else—that it has been known to succeed where others failed. Not only that—you must remember that I send you a big triple size box—nearly three times as big as the ordinary box of tablets.

At any rate, the risk is all mine. You can't afford to pass up this Special Introductory offer a single minute—it may never be made again.

Send No Money — Just Write Me, That's All.

All I need is your name and address—just put it on a postal card or use the coupon below—I'll understand and send you the tablets post paid by return mail.

R. C. COMBS, Gen. Mgr., Milk Products Co.
668 Creamery Bldg., Kansas City, Mo.

As per your offer send me your big triple size box of **Comb's Buttermilk Compound Tablets.** I understand I may use the tablets in a 30 days' test, and if satisfied they cost me $1.00, otherwise they are to cost me nothing.

Name .....

Address .....

R. F. D. .....P. O. Box.....

Dickson. Bull entered in Register of Merit, shown with four of his progeny, at least two of which must be females in milk—1, F. E. Lynn, Oregon.

Senior champion bull—Captain Tristram. Junior and grand champion bull—Esther Pilot of Waikiki.

Senior and grand champion cow—Eminent's Jimp's Owl. Junior champion cow—Verna of Laurchester.

Students' Contest in Judging Dairy Cattle

This is the third dairy cattle judging contest of the kind held under the supervision of the Western Dairy Instructors' Association. Four teams were entered in the contests this year, representing the University of British Columbia, University of Idaho, Washington State College, and the Oregon Agricultural College.

The scores made were very close and the contestants demonstrated the excellent training they have received from their instructors.

The following are winners in individual prizes: Alfred W. Loy, Oregon Agricultural College, was high man of the contest; Bert Sweeting, University of British Columbia, second; and A. L. Leonard, Washington State College, third.

The high students in Holsteins were: A. J. Leonard, first; and W. T. Putman, Washington State College, second. The high students in Guernseys were: Alfred W. Loy, Oregon Agricultural College first; and Carl L. Patch, University of Idaho, second; and the high students in Jerseys were: Bert Sweeting, University of British Columbia, first; and Herbert Nelson, Oregon Agricultural College, second.

The Oregon Agricultural College team made the highest score, all breeds considered and were highest on Guernseys; the best total on Holsteins was made by the Washington State College; and the University of British Columbia made the best rating on Jerseys.

Students' Dairy Products' Judging Contest

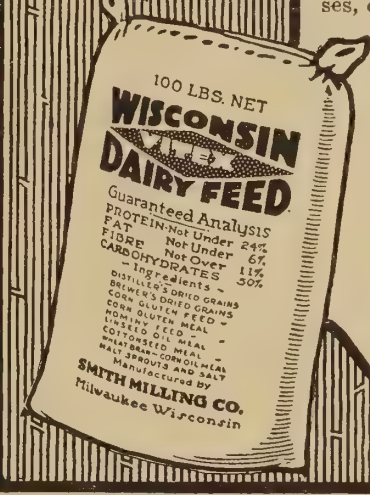
The standing of teams in this contest, in which butter, cheese, and milk were scored, is as follows: First, University of California; second, Washington State College; and third, University of Idaho, and the plaque offered by the Pacific International Live Stock Exposition was won by the University of California for having the highest total score.

In judging butter the Washington State College made the best score; in cheese, the University of California; and in milk, the University of Idaho.

G. R. Jaehnig of the University of California was high man of the contest and his team mate, L. H. Nielson, was second. Robert Tucker of the Washington State College was third.

Ames Dairy Short Course

A three months' course in dairying, beginning January 10, is offered by the Iowa State College, Ames, Iowa. It is offered to men who are interested in taking up buttermaking, ice cream making, cheese making, and market milk work, and is a part of the regular six months' dairy course.



Students entering in January can secure positions in dairy factories where they can work during the summer months and obtain valuable experience and at the same time receive full compensation for service rendered. They may then enter for the second term's work in September and have the six months' course completed by January.

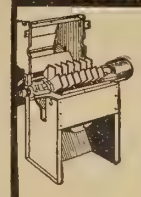
Iowa. M. MORTENSEN.

Tile drain those places where wheat, alfalfa, and clover were heaved out last winter by frost. This work can be done during the late fall and winter months when general farm work has slacked up somewhat.

WISCONSIN VITEX DAIRY FEED

4-All is a scientific blend of oil meals and nutritious grains. It is an economical strength builder and meat producer.

COWS eat Vitex eagerly. They digest it thoroughly and pay you dividends in the form of greater milk production.



Vitex keeps the cows in better condition and gives you a bigger daily milk yield at lower feeding cost.

It is made from choice milk producing ingredients without molasses, oat hulls, screenings, dirt, chaff or other worthless fillers. Our exclusive process of mixing insures that every sack runs uniform. You can gauge your feeding exactly and know the production value of every pound of Vitex. Put your herd on a Vitex ration and watch results. You will be convinced.

If your dealer has no Vitex or 4-All on hand, write us.

EDITORIAL COMMENT

DRY GRASS

There is a strong tendency to consider that hays and grasses of the same kind have the same kind of nutritive properties. That is to say, alfalfa would be identical in composition with all alfalfa cut at the same time and cured in the same way, and grass grown for pasture would have the same feeding value. Close observers have discovered that this is not true. Soil and perhaps other factors cause plants of the same kind to vary in composition and in feeding value.

In the Middle West we do not look upon dry grass as being very nutritious or a desirable feed, especially for milking cows. In the West, however, the grass which has been frosted and dried is a very nutritious feed—if the condition of cattle and horses may be used as a basis of judgment. In passing through Montana recently, we were struck by the high condition of the live stock seen along the way. Many of the cattle were apparently ready for market, the horses were fit, and the dairy cows in exceptionally good condition.

The animals were grazing among the sage brush and there was nothing but the dry grass. There is seemingly something in the soil of this section that produces a grass of high nutritive properties and it shows conclusively that in the older sections the soil may be so fed as to improve the quality of feed for our live stock. It suggests, too, that the making of certain combinations of feed is highly desirable to obtain the best results. Some day we shall know how to make better combinations of feeds so as to nourish our cattle better. This will mean larger milk records and better developed calves.

The dry grass of the plains country may hold a valuable lesson for us.

CUTTING ALFALFA

Cutting alfalfa at the proper time is more important than is appreciated by a majority of growers. When alfalfa is cut too late in the fall it is likely to winter-kill, unless there comes an early fall of snow and it lasts until late in the spring to protect it. A growth of from 8 to 12 inches will help hold the snow and keep the ground from thawing and freezing.

In the north latitudes we do not consider it a good practice to cut alfalfa after the first week in September for after that date the weather conditions are not likely to produce a sufficient growth to protect the roots of the alfalfa. Cutting alfalfa too late in its maturity we know weakens the plant and makes winter-killing easy. When alfalfa is ready to cut the crown is sending out little shoots and if permitted to stand long after this the mower will cut the ends of these shoots and growth is stopped. New shoots are sent out and this requires strength from the roots.

Late this fall we visited the farm of J. Q. Emery of Wisconsin and noted that his alfalfa was apparently divided into two fields. It appeared as though the field might have been seeded at different times. Upon inquiry we learned that one-half of the field was cut late in the previous fall and the other half was not cut. The half that was cut late in the fall was decidedly a poorer stand than the other half. The plants were not so vigorous, June grass was coming in, large patches were bare of alfalfa, in short, it was fast reaching a stage when it should be plowed up. The half that was not cut late in the fall was almost a perfect stand and showed in every way, by its color and growth, to be a well established and properly treated field of alfalfa.

It was an open question with Mr. Emery whether cutting late in the season or late in maturity caused the difference or rather weakened the growth of the alfalfa plants and caused many to die. Before the late cutting this part of the field had the better stand. The difference in these fields may be attributed to cutting the alfalfa too late for the line of demarcation between them is distinct. Whether the plants died because they were weakened by clipping the new shoots or by exposing the crowns and roots to freezing and thawing is a question which cannot be definitely answered. It matters little which was the cause of so many plants dying, the results told the story of bad practice. This field shows conclusively that unless proper attention is given to cutting alfalfa at the right time that it is likely to be killed.

ANOTHER VICTORY FOR DAIRY FARMERS

"The dairymen of California have just won a sweeping victory in a suit brought by our enemies, in which an attempt was made to take away our charter." This message from the Associated Dairymen of California is one of good cheer for all those interested in co-operative marketing. The court decision is the first ever made in that state on the points involved—fundamental principles in the co-operative movement among producers.

It was claimed that the Northern California Milk Producers' Association is so organized and so conducted that it should "be excluded from all corporate rights, privileges, and franchises", that it should "be dissolved and its franchise revoked and cancelled". It was charged that the association has conspired with others and formed a trust which unlawfully controls the purchase and sale of milk in California—that through this trust competition in the sale of milk is prevented and the price of milk and milk products is increased to the public.

The association was successful in having the court "strike out" this charge. That left, in the opinion of Peter J. Shields, Superior Judge, "a confused charge, too vague to be made the basis of inquiry". He states: "A great industry should not be called upon to defend itself against charges so uncertain and impermanent as the record discloses in this case. . . . With this charge removed the case loses all character as a public action, and completely fails to state a cause for action for the relief asked for."

This court opinion is further legal vindication of the effort of dairy farmers to take part in the work of marketing of their products. It is a notable addition to the number of court victories already won by co-operative organizations.

EGGS AND MILK

Along the coast of Alaska fish eggs are an important food, especially among the people who have little or no milk supply. We are informed by a person engaged in government service that when the fish fail to come up in the spring thousands of babies die. Eggs are used to feed babies where a supply of milk cannot be obtained and where the mother fails to provide enough for her baby.

It was discovered by Dr. E. V. McCollum that the fat of a hen's egg contains a vitamine or an unknown substance which he has termed soluble A. He proved that a young animal denied this substance, soluble A, would not make proper growth and in time death would ensue. This substance is found in grass, leafy vegetables, and roots of yellow color. Some nations get it principally from these sources. But in Alaska the supply of vegetables is not always abundant, especially among the Indians. Moreover, vegetables for an infant could scarcely be considered good food. These people are forced to feed fish eggs to their infants and we surmise that they contain this life giving substance, soluble A, for it has been well demonstrated that it is essential to young and we know no reason why the young fish should not require it as much as the chick or the baby.

How fortunate we are to get an adequate supply of this substance in milk—cheap, wholesome, and nutritious. We do not have to resort to fish eggs, to carrots, or grass for our supply. The cow will eat the carrots and grass and refine them into the best of human foods. Yet there are thousands of persons who are denying their children and themselves an adequate supply of milk.

The Indians of Alaska learned from sheer necessity the value of fish eggs to their infants, but it took a scientist to give the reasons for their value. This same scientist has explained the relation which eggs have to milk. Both were created to supply food to the young.

TAKE TIME TO KNOW

It is wrong to accuse a person or firm of underreading the Babcock test for fat or giving improper weights unless the accuser knows that cheating has been done. Every dairyman should weigh his milk and cream and know their tests before he charges the person or firm to whom he sells it with making false returns. It pays a dairyman to weigh and test each cow's milk occasionally for the purpose of determining what each cow is doing. If care is taken it can be determined how much total fat and milk a herd is producing. To be exact, a farmer should weigh his milk or cream when he has it ready for market; then he will know just what amount he is selling.

A well-to-do farmer recently called our attention to a neighbor of his who claimed the company to whom he sold his milk cheated him out of 80 pounds a day. This man was asked if he weighed his milk, and he said, "No," and then added, "but each can holds 10 gallons and a gallon of milk weighs 8.6 lbs. I should have 86 lbs. of milk in each can, and I ship 15 cans of milk per day." Here is the reply from the man to whom these remarks were addressed, "You are mistaken about a ten-gallon can holding 86 lbs. of milk. When new and carefully filled a can seldom holds over 84 lbs. of milk and the most of them less. In shipping the can becomes jammed and that makes them hold less, and further care must be taken to fill a can full of milk. The only way for you to determine whether you are getting honest weights is to weigh your milk when it is ready to ship. It is nothing short of criminal to accuse someone of cheating you when you have never weighed your milk."

This was straight talk from one neighbor to another, but it set forth facts, gave good advice on what to do before accusing another person of stealing. There would be less fault finding, fewer accusations, and more confidence in others if every person took the time to know.

Crops on Tile Drained Marsh

I have just completed a job of tile drainage of a marsh on my farm and I am not clear as to what should be done with the land next spring by way of cultivation, cropping, etc. The peat and muck range in depth from 8 inches to 3 feet, according to location with a sandy subsoil. I would like to know how deep the soil should be plowed the first year and what crops can be successfully grown the first season. Some farmers often sow flax or buckwheat on such ground while others seed it to grasses and occasionally oats, rye, or corn is planted the first year but I am afraid that the soil would be too cold for such crops the first season. Flax or buckwheat is hard to harvest and does not, as I understand it, improve the fertility of the soil. I presume the ideal plan would be to fertilize the ground with manure or some commercial fertilizer, but I am not in position to do either next spring and am seeking something that would take its place and at the same time benefit the soil.

Illinois. C. J. M.

The choice of a crop to grow upon the tile drained land should be made upon the basis of its adaptability and its effects upon the soil rather than upon the economic use to which it may be put. The choice, for these conditions, is necessarily limited to a rather narrow range. Crops which will make a fairly good growth and which will tend to make the peaty condition of the soil decompose are the ones to look for. The crops mentioned are the ones from which to make a choice.

We are inclined to believe that corn and buck-

wheat would be among the best ones to select, as both have certain advantages for conditions such as described. Buckwheat is a very vigorous feeding plant and will stand both an infertile and an acid condition of the soil better than most other farm crops. It is quite possible that this soil may be somewhat acid or sour owing to the presence of an accumulated amount of partially decomposed organic matter. Corn, likewise, will handle this condition fairly well, and the cultivation which it would receive during the summer would aid in a rapid decomposition of the pea. It is quite possible that corn would serve best of the crops. As suggested, an application of stable manure would do a great deal toward a successful crop of corn. It is also barely possible that soy beans might do fairly well, since crops like this and corn have an advantage in being planted later than other spring sown crops. Oats might also be tried since this crop is also a vigorous feeder and stands an acid condition of soil very well. We would not advise seeding the land down for a few years at least. It will be much better to keep it growing the regular cultivated crops in order to get the soil in good condition. Eventually it might be profitably laid down as a permanent pasture.

For the coming season seed portions of the field to the crops suggested. This would give a line on those that will do best. In the matter of plowing, we would say that our inquirer should plow at least from six to seven inches deep. Follow the plowing with thorough cultivation, working up as good a seed bed as is possible.

Sugar Beet Information

1. Can sugar beets be grown successfully on old meadow sod not very rich?
2. What distance should the rows be apart?
3. What distance apart should the plants be in the rows?
4. How early in the season should sugar beets be sowed?
5. How often should sugar beets be cultivated during the season and should they be hilled the last cultivation?
6. At what stage of the plant should the beets be blocked or thinned out?
7. Should sugar beets be raised on the richest land of the farm?
8. Will commercial fertilizer be beneficial, if the land has been well manured with barnyard manure this fall and plowed under?
9. Should sugar beets be cultivated and handled differently in dry seasons like this last season?

Milwaukee, Wis. W. C. O.

1. Yes, it is best to plow the meadow in the fall so as to start decomposition of vegetable matter early, so as to compact the soil and to expose the plowed soil to freezing and thawing during the winter months. Plant food is rendered available and usually one good crop can be raised on such a field under ordinary conditions of weather.

2. The rows should be from 20 to 22 inches apart.

3. The plants should be from eight to ten inches apart in the row.

4. Plant sugar beets just as soon as the soil is warm and dry—about corn planting time. Generally the earlier the beets are planted the more vigorous their growth.

5. After the beets are planted and as soon as the beetlets show up above the ground in rows begin to cultivate. After thinning, cultivate frequently so as to keep the field clean of weeds. Cultivation will hasten the early rapid growth of the plants so that the tops will cover the ground between the rows before the usual hot, dry weather begins. The leaves protect the soil moisture from evaporation which promotes the healthy growth of the root. After 8 or 10 leaves are formed do not cultivate too close to the plant nor too deep. Close, deep cultivation checks growth by cutting too many side roots which serve as feeders to the plant. Cultivate from three to five times during the spring and early summer and until the tops meet between the rows. We do not recommend the killing of beets at the last cultivation.

6. When the beets are from two to four inches high they should be blocked, leaving two or three inches of beets in each block. This work can be done by using a hoe about 7 inches wide. Thin out to one plant in each block leaving the moist, vigorous plant to produce the beet, every 8 or 10 inches apart in the row. This work should be done with care and, above all, it must be done on time. The condition of the crop at this time and the evenness of the stand will largely determine the success or failure of the crop.

7. Yes, sugar beets will grow best on rich land. They will do particularly well on rich, sandy loam soils. However, we would not attempt to grow sugar beets on any kind of low and poorly drained soils, although rich in plant food.

8. Sugar beets are generous feeders of nitrogen and potash and an application of these two fertilizing ingredients in the form of commercial fertilizer would favorably supplement the plant food derived from barnyard manure. Our best results on sandy, loam soil were made by the application of 150 lbs. of sulphate of potash, 300 lbs. of acid phosphate, and 150 lbs. of sulphate of ammonia to the acre.

9. Usually in times of dry weather, cultivate frequently so as to conserve moisture. Cultivate more frequently under such conditions than you would under the average conditions. Cultivation will form a moisture at the surface and will conserve the moisture which the sugar beets so much need for their best growth.

Wisconsin. J. F. WOJTA.

Flaxseed Too High to Feed

I have about 25 bushels of flax. What would be the result of the flax in the ration? Should it be ground and mixed with other grains, should it be fed whole, or shall I boil it and feed it?

Hartford, Wis. M. M.

If a market can be found for this flaxseed, the oil usually brings so good a price that it is best to sell the flaxseed and purchase oil meal. If it is desired to feed flaxseed, it is very high in feeding value and serves an excellent use in dairy feeding. It should be ground. As compared to oil meal it is very much higher in fat content and contains only about half as much digestible proteins and carbohydrates on the average. One hundred pounds of flaxseed contain 20.6 lbs. of protein, 17 lbs. of carbohydrates, 29 lbs. of fat, and equivalent in the total digestible nutrients of 102.8 lbs. This compares with the average analysis of oil meal which gives the digestible contents as 31.7 lbs. of protein in each 100 lbs. of meal, 37.9 lbs. of carbohydrates, 2.8 lbs. of fat, and a total of digestible nutrients of 75.9 lbs.

In feeding, attention should be given to the difference in nutrient contents. We recommend that this feed be used rather as a conditioner than as a part of the regular ration. Small calves will bring good results if a little flaxseed is fed. Also heavy milking cows will do well for having consumed one pound, or even one and a half pounds, per day in the grain mixture. It combines well with such grains as corn, oats, and cottonseed meal, a good mixture with usual farm roughages being: 400 lbs. ground corn, 300 lbs. ground oats, 100 lbs. cottonseed meal, and 100 lbs. flaxseed.

May we ask a favor of our readers?

Will you take just a moment's time — and glance at the address label on your paper?

And if you find these figures "Dec. 20" or "Jan. 21" on the label, will you please send us your renewal order — today?

1 year $1 3 years $2 5 years $3

Thousands of subscriptions expire between Christmas and New Years, and thousands of orders come to us at that time. That means hurry and hustle, and when orders come late, mistakes may happen.

If you want to do us a favor, and assure yourself of not missing a single issue of Hoard's Dairyman, mail your renewal now. Thank you!

Steam Sterilizer

Am considering the installation of a dry heat sterilizer in our new dairy. Sterilizer will be six feet long, four feet deep, and five feet high, constructed of two layers of "tongue and groove" between which will be a layer of 85% magnesia boiler insulation. Door of same construction. Wish to obtain a temperature of about 300 degrees F. in a comparatively short space of time after steam is turned into coils. What length of one inch pipe (or square feet surface area) will be required with steam at 80 lbs. pressure? What size boiler would be required, making due allowance for other uses, such as steam turbine bottle washer, water heating, etc., for a dairy of 1,000 quarts daily capacity, no pasteurization, nor power required therefrom?

Hilo, Hawaii. R. E. C.

A temperature of 300 degrees F. is dangerously near the melting point of solder, it being about 304 degrees F. Experiments here demonstrate that a dry temperature of 230 degrees F. when held for 30 minutes gives satisfactory results, or a temperature of 284 degrees held for 2 minutes, or a temperature of 266 degrees held for 4 minutes. A temperature of 270 degrees F. dry heat, when held for 5 minutes gives as good results as a temperature of 212 degrees F. produced by flowing steam for the same time.

It is, therefore, recommended that you maintain a dry temperature of 270 degrees F. in your sterilizer for 10 minutes. By so doing you will effect satisfactory sterilization, and at the same time avoid the possibility of melting the solder of the utensils and greatly reduce the pipe area required.

The area of pipe required depends upon how well the chamber is constructed and the method of connecting and draining the pipes. With a well constructed chamber and the pipes connected to a header and properly drained, the number of linear feet of one-inch pipe required is 200.

For a non-pasteurizing plant of a 1,000 quarts capacity a 10 H. P. boiler should be used. It would be possible to get along with a smaller boiler, but a 10 H. P. would be the most economical.

U. S. Dairy Division. J. T. BOWEN.

Beet Tops for Dairy Feed

HOARD'S DAIRYMAN:—Where sugar beet tops are grown for the factory, the tops form an important by-product that is sometimes not appreciated. I am not aware that any accurate test has been made to determine their relative feeding value but many dairymen consider them equal to corn ensilage, weight for weight, and the cows of at least one feeder I know showed a small gain in milk when taken off from prime corn ensilage and given the beet tops.

The cheapest way to feed the tops is from the field. In the sugar beet districts of the north, however, the tops usually freeze before many of them are fed. These frozen tops should not be fed to calves or young stock as they are likely to cause poisoning. The old cows do not seem to be much affected by this. If possible, what cannot be fed in the fall should be put into the silo. If this cannot be done, they should be hauled into the barn several days before feeding, and the frost will go out of them.

To ensile the tops they may be put in whole or they may be chopped. The whole tops will settle down and make a compact mass which will exclude the air and keep a long time, except a foot or so on top. The air will penetrate for this distance down and cause them to rot down. When rotted, this seals the silo and prevents further spoiling. To avoid such a lot of waste, corn ensilage may be placed on top of them or wet pulp from the factory will answer the same purpose. If the silo is already partly full of corn or other ensilage, the beet tops may be put on top of it without any bad results.

Michigan. HARRY L. SPOONER.

Fat Percentage Not Changed by Feed

In feeding dairy cattle can you supply a cow feed that will make her milk richer in butterfat?

Bolivar, Mo. C. E. C.

The per cent of fat in a cow's milk is characteristic for the animal and is not affected for any considerable period of time by the ration supplied; that is to say, a cow whose normal fat percentage is 3.5 cannot be made into a 5 per cent cow simply by a change in feed. A cow can be made to produce more fat by liberal feeding, but this increased quantity comes through the fact that the production of milk is greater with well fed cows and not through increased fat percentage. Over short periods it is possible to increase the fat percentage. It is thought that certain manipulations of the ration may be used to give abnormal tests in semi-official record making, this change lasting, however, for a very short time. In the seven-day test records with Holsteins, cows which have been put into a high condition of flesh produce milk which has an extra high fat content for a few weeks after the cow freshens. In a short time, however, she comes back to her normal fat percentage.

Coming Events

Jan. 4—6, 1921, Wisconsin Cheesemakers' Association meets in Milwaukee. Secretary, J. L. Sammis, Madison, Wis.

Slashing of Prices for Feeds Becomes General

Declines in Prices for Coarse Grains Affect Market for Feedstuffs—Demand Continues Dull

[From Report by U. S. Bureau of Markets]

The inability of jobbers to dispose of transit offerings promptly during the week ending Nov. 27 accelerated the decline in the value of feedstuffs. Slashing of prices became general because of the decline in coarse grains and the prevailing belief that prices of feedstuffs are out of proportion with those of coarse grains. For example: A ton of corn in the Chicago market was worth about $24, while hominy and gluten feed were selling at $8 to $10 and $20 to $23, respectively, higher.

With bran selling in the majority of the markets at higher prices than are asked for 36% cottonseed meal and linseed meal containing a lower protein content than 36% cottonseed meal selling at $10 to $15 per ton higher than that commodity, country buyers are reported to be showing an increased tendency to compare costs per unit of available nutrients before placing their orders.

Pittsburg, Cincinnati, St. Louis, and several other important markets report available supplies of feeds in excess of the demand. In the Minneapolis market where prices for bran and middlings were pegged during the last three weeks around $31.50 and $29, jobbers quoted $30 and $26.50 on Nov. 27, because of oversupplies, especially of middlings.

Quotations on bran were $30 in Minneapolis and Kansas City, $34 in Chicago, $39 in Pittsburg, New York, and Boston, $51 in Los Angeles, and $55 in San Francisco. In general middlings were $3 to $4 under bran except in the East and far West where prices on these two feeds were about the same.

Cottonseed meal (41%) was $46 in Minneapolis, $45 in San Francisco and Los Angeles, $41 in Chicago, $43 in Pittsburg, Philadelphia, and Boston, and $33 in Memphis. The 36% meal ranged about $3 under these prices. Texas shippers quote 43% meal at $31 f. o. b. common points or $43.50 delivered Chicago.

Linseed oil meal was quoted at $48 in Minneapolis, Omaha, Philadelphia, and New York, at $50 in Chicago, $53 in Pittsburg, and $54 Boston. (Retail dealers in Southern Wisconsin were able to buy on December 2 at prices permitting them to sell to farmers 33% meal at the car for $50 cash.)

Gluten feed was quoted as low as $31 in Minneapolis, but Chicago quoted $48 and eastern cities were selling at around $52. Hominy feed sold for $27 in Minneapolis, $33 in Chicago, $39 in Pittsburg, $29.50 in Omaha, and up to $44.50 in Boston.

Beet pulp was quoted at $44 in Chicago and dealers were offering it delivered in carload lots in southern Wisconsin at $46.80. Velvet bean meal was quoted at $36 in Jacksonville a d dried brewers grains at $45.50 in New York.

Hay was in heavier receipt, and prices declined slightly. No. 1 timothy was quoted at $24 in Minneapolis and Kansas City, $30 in Chicago and Philadelphia, $37.50 in Boston, New York, and Jacksonville. Mixed clover was about the same price as straight clover, prices ranging from $2 to $4 under timothy.

The general market on alfalfa is about $2 higher than a month ago, the average at eight important markets being $30.75 for No. 1. Quotations on No. 1 alfalfa are $26 in Omaha, $26.50 in Kansas City, $23.50 in San Francisco, $28 in Minneapolis, $32 in Chicago, and $31 in Cincinnati.

Oregon Farm Bureau Organized

Representatives of the county farm bureaus in Oregon recently met in Portland and outlined a tentative state federation. This action followed a meeting in Eastern and in Western Oregon, where it was decided to proceed with such an organization plan. A committee was appointed to draw up preliminary plans, which were accepted at the Portland meeting and will become permanent upon ratification of the constitution by twelve county farm bureaus.

Chester H. Gray, president of the Missouri State Federation and a member of the executive committee of the American Farm Bureau Federation, was present and outlined the work of the National organization. George A. Mansfield of Jackson County, was elected president of the temporary organization and W. W. Harrah of Umatilla county vice-president.

The growth of farm bureaus in Oregon has been conservative. None were organized previous to 1919. Organization developed gradually as the farmers became familiar with the progress of the movement. Eighteen of the twenty-six counties in the state now carrying on extension work have organized farm bureaus, while the remaining eight are in various stages of organization.

Oregon. F. L. BALLARD.

W. W. Weir, formerly instructor in the soils department of the University of Wisconsin. He has recently been appointed managing editor for the Soil Improvement Committee of the National Fertilizer Association with headquarters in Washington, D. C. Readers of Hoard's Dairyman will remember the excellent series of articles from Mr. Weir's pen on soil problems, which was published in issues of volumes 58 and 59.

Wisconsin Milk Prices

There have been numerous inquiries as to prices paid for milk by condenseries in Wisconsin during the month of November. The State Bureau of Markets has furnished us with the following table showing the prices paid by condenseries in various counties of Wisconsin:

County	Price per 100 lbs.	Test basis %	Differential per 0.1% test
Clark	$2.40	4	
Dane	2.52	4	$.05

An Opportunity for Ameriean Stock Breeders

American stock breeders and distributors of dairy appliances who are looking toward the Argentine market will be afforded opportunity for demonstration at the annual international dairy exhibition of the Argentine Rural Society to be held at Palermo, a suburb of Buenos Aires, May 8-27, 1921.

The exhibition will be divided into three sections: the first for breeding and dairy cattle, sheep, and goats; the second for dairy machinery and appliances; and the third for dairy products. Applications for space should be addressed to the manager of the society, Sarmiento 834, Buenos Aires, where they will be received up to April 10.

Two representatives of the United States Department of Agriculture, David Harrell and H. P. Morgan, visited the exhibition last year while on a tour of investigation of live stock and dairying conditions in South America. They report the farmers of Argentina to be deeply interested in improving the dairying industry, which is still in a primitive condition in many parts of the country, and to be friendly toward American breeders and manufacturers. They suggest that much more rapid progress in establishing American agricultural relations with South America can be made by practical demonstrations than by correspondence or advertising, declaring that so much erroneous advertising has been done by importers of stock and other merchandise that the people are skeptical of printed matter. They express the belief that there is an opening for the sale of American cattle and equipment, remarking that, "it is impossible that this good cattle country should stay permanently in its present condition, which is about that of the Southwest 40 years ago."

The Argentine Ambassador at Washington is manifesting much interest in the exhibition, and information regarding it can be obtained direct from him without the delay of writing to Buenos Aires.—U. S. Department of Agriculture.

Western Guernsey Breeders' Sale

The second annual sale of the western Guernsey breeders was held at the Pacific International Stock Show sale pavilion at Portland, Ore., November 18th. Twenty-five animals were sold for an average of $444.60. The sale was attended by over two hundred and fifty people, but the buyers were rather few. It had been rather difficult to secure enough animals from the different breeders to hold a sale so that the quality was not as high as it might have been had the animals been more plentiful. The fact that several animals of very plain breeding were brought into the ring in rather poor condition lowered the average of the sale very much.

Edna of Mountain View 70827, a cow owned by Leslie G. Perry of Idaho, topped the sale at $950. She was purchased by Wallace and Fordyce at Washington. The senior champion bull, Jolly Fermain, sold for $700 to Ira G. Lance and E. Harrison of Oregon.

The list of buyers and animals sold follows:

Ira G. Lance and E. Harrison, Oregon	
Jolly Fermain	$700
Frank A. Rowe, Oregon	
Red Wing Starlight's Acorn	$500
M. Ryan, Oregon	
Landom's Beauty	$410
Alvin E. Hornshirk, Oregon	
Ra's Spotswood Sweet Brier	$405
H. E. Angel, Washington	
Hambro's Deriloffa	$575
R. H. Thomsen, Washington	
Middle Dale Golden Maid	$460
W. H. Evans, Oregon	
Cascade Trixey	$400
Wallace & Fordyce, Washington	
Chicome Loven	$435
Edna of Mountain View	950
Homer Mason, Oregon	
Linnie of Chicona	$500
Wm. Bues, Washington	
Nedra of Chicona	$900
F. S. Peer, New Jersey	
Merle of Chicona	$700
J. F. Patty, Washington	
Sara of Mountain View	$525
A. E. Engbretson & V. H. Harwood, Ore.	
Hope of Mountain View	$425
W. O. Reith, Oregon	
Elaine of Chicona	$800

Jersey Cattle Notes

For week ending November 26: Number of animals registered: bulls, 163; cows, 545; total, 708. Number of transfers recorded: bulls, 148; cows, 545; total, 693.

AYRSHIRE CUP TO UNIVERSITY OF VERMONT

One of the greatest forward steps ever taken by the dairy breed associations was the establishment of the various Advanced Registry and Register of Merit systems. When Advanced Registry was inaugurated by the Ayrshire Breeders' Association the cow, Rena Myrtle, bred by C. M. Winslow and owned by the University of Vermont, was the first to complete a record. Rena's Myrtle's record of 12,172 lbs. milk and 467.92 lbs. fat was unexcelled and she stood as champion of the breed for some ten years. Thus the honor of completing the first Ayrshire record fell to the University of Vermont.

In recognition of the issuing of this first certificate of Advanced Registry the Ayrshire Breeders' Association recently presented the University of Vermont with a silver loving cup. The University appreciates this gift both for its historical significance and the distinction it brings the University.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., DEC. 2—George E. Flanders, attorney for the Division of Agriculture of the State Department of Farms and Markets of New York, has recently called attention to the danger to dairy interests found in the bill now pending in Congress pertaining to the labeling of package goods in interstate commerce. This bill, he says, provides that package goods in inter-state trade shall not be interfered with by the states. This, in the case of oleo and similar preparations, would result in the state assuming police control only of goods made within the state where offered for sale, but this control would be of no effect on goods made outside the state and shipped in. "It is necessary," said Mr. Flanders, "for the dairy interests to be watchful if they are to be protected against the clever designs of the manufacturers of imitation butter, imitation milk, and similar products."

This measure has had careful attention by the House committee on interstate commerce, and is still before that committee. It, along with a good many other pending matters both of legislation and in the courts, hinges on the conflicting rights of state and federal governments in inter-state commerce. Dairy interests, neither more nor less than many other interests, are much concerned. Mr. Flanders is a former president of the National Dairy Union, the national dairy protective association, and in that position and in his present position as attorney for the New York State Department charged with the enforcement of pure food laws, has proven that he is one of the best and most watchful friends of the dairymen in the United States. If it it dangerous in his judgment, it means that this legislation should be promptly opposed by everyone with the best interests of the dairy industry at heart.

⚜

Secretary and Manager Warber of the National Milk Producers' Association has started a bulletin service for the interchange of items of information as to the activities and work of the various milk producers' associations federated with the National. His last bulletin contains references to numerous recent happenings in a number of the important associations, which makes it most interesting to the producers of fluid milk everywhere. Coming as it does so quickly after his very complete report of the recent three-day session of the association in Chicago, this indicates that Manager Warber has his office and its work well organized, and is ready to go on and do a big year's work in the interest of the dairy industry.

⚜

A steady undercurrent is manifest here just now, on the eve of the return of President-elect Harding to the United States and to Washington, in favor of bringing sufficient pressure to bear on him to cause the appointment of a secretary of agriculture to serve agriculture, not to serve political purposes. People close to the President-elect say it will not be difficult to get his approval providing two qualifications are possessed by the man or men brought to his attention, one real qualification as a farmer, administrator, and man of outstanding ability; the other that the man, or men, suggested be free from personal or political animosities or relationships incompatible with the Harding policies. The dairy industry stands so large among the subdivisions of agriculture that it ought to be able to suggest from among outstanding representatives of the industry some man or men big and able enough to become secretary.

⚜

One resolution passed by the National Grange has more public interest than appears on the surface. It is the proposal adopted at Boston last week to assemble the various public welfare activities of the government under a woman secretary of public welfare, with a seat in the cabinet. A study of this proposal shows that it is intended to take the social service work now under extreme radical leadership in the Department of Labor and put it, along with the narrow and unprogressive bureau of education from the Interior Departmen , and the hospital and public health services from the Treasury and Interior Departments, and the home economics work now misplaced in the Department of Agriculture, and put them under a broad and progressive department. It was a coincidence that just one week after this was adopted by the Grange, Senator Medill McCormick of Illinois should come out with a fully matured plan to enact a law not only carrying out this plan in its full details, but also reorganizing the Interior Department as a Department of Public Works. These two plans, if they can be put into effect by Congress, will strengthen what is now the weakest, least efficiently organized, and most radically handled departments in the federal government, and work economies which are badly needed.

Exports of Dairy Products

The total exports of dairy products for the ten months ending October 31, 1919 and 1920, were as follows:

	1920 lbs.	1919 lbs.
Butter	16,676,775	29,687,470
Cheese	14,645,414	11,090,861
Cond. and Evap. Milk	374,542,930	705,803,814

This shows a decrease of nearly 50 per cent in the exports of butter and condensed milk, but exports of cheese are approximately 30 per cent greater. Figures are not yet available on the imports of dairy products, but they will unquestionably be considerably higher. These two items, while not relatively large as to our total production, doubtless explain in part the decreased prices now prevailing. There are so many factors involved, however, that it is well not to speak with too great positiveness as to what the future may have in store.

If we were to venture an opinion it would be that with the present prices of grain and feed, the dairy cow will buy these at a better return to the farmer than direct sales of grain on the market will bring. Despite all pessimistic forebodings and despite the unquestionably hard position many producers now occupy, we believe dairy farmers as a whole are now in a better position than a year ago and that the immediate future is full of promise. General business conditions will have a large effect in establishing the buying power of the wage earner, and this tends to make the future somewhat uncertain. Insofar as exports and imports are concerned, as well as stocks on hand, we see no present occasion for anxiety.

His Necessity Your Privilege

Railroad men live with one eye on the dials of their watches, making every effort to have trains leave and arrive on time. Conductors and engineers *must* carry reliable and accurate timepieces.

Farmers, also, are relying more and more on the Hamilton—"The Watch of Railroad Accuracy." On the farm, exact time may not be a matter of life or danger; but there is no place where time counts more than on the farm.

Engineer Frank R. Lippincott pilots the "Twentieth Century Limited" out of Chicago on its first lap to New York. Engineer Lippincott is a veteran of forty years, and has been a pilot of the "Century" since that famous train was first inaugurated. He carries a Hamilton and has done so for ten years.

Hamilton Watch

"The Watch of Railroad Accuracy"

And why shouldn't you have a Hamilton? It would cost you no more, and the farmer who carries reliable time can plan his busy day as a railroad chief plans his train schedule. There is deep personal satisfaction, moreover, in precision and accuracy.

Prices range from $40 to $200. Movements alone, $22 (in Canada $27.00) and up.

Shall we send you "The Timekeeper"—our booklet? "The Timekeeper" tells how to care for a fine watch. The different Hamiltons are illustrated and prices given.

A Diet That Promotes Milk Flow

AN athlete, training for games, is very careful of what he eats.

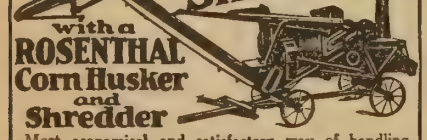
In a similar manner the dairy herd may be said to be "training" for a greater milk production.

The cows should be very carefully fed.

Armour's Dairy Feed is just right for such a diet. It keeps milking cows well nourished, in good health, and in the pink of production.

A trial test will make you a constant user

ARMOUR'S DAIRY FEED



Examine Armour's Dairy Feed at your dealer's, or write us for a sample and state in what quantities you usually buy. The Armour dealer will gladly supply you with Armour's Stock Feed and Armour's Hog Feed also.

ARMOUR GRAIN COMPANY
CHICAGO, U.S.A.

With this wonderful new **Libbey Automatic Water Bowl.** Each bowl controls own water supply. Animal moves lever, opening water valve, when it starts to drink. Lever swings back closing valve when animal stops drinking. No float tank required. Bowls may be put at different heights or in any stall or pen. Cannot overflow; cannot get out of order; almost no water left in bowl. Most sanitary bowl ever sold. **Prevents spread of contagious diseases.** Increased milk yield quickly pays back cost. Saves labor; saves feed. Write today. Also for Catalog if interested in Stanchions, Stalls, Carriers, etc. Sent free.

C. A. LIBBEY COMPANY
195 Marion St., Oshkosh, Wis.

Most economical and satisfactory way of handling your corn crop. **No delay, no extra help.** Do it in your own spare time. Two sizes for individual use, 6 to 15 h. p. Also make three larger sizes for custom work. Over 20 years in the field. Write for catalog and Free Farmers Account Book. State h. p. of your engine.

Banishing Milking Troubles

(Continued from first page.)

fessor E. S. Archibald of the Ottawa Agricultural Experiment Station, who has tested more extensively and thoroughly the merits of mechanical milkers than any one else in America, says, "After many years of experience with various types of milkers, we have found that the mechanical milker properly handled is preferable to the average available hand milker."

Conclusions of this sort are not snap judgment but are based on the test of time. There are numerous cases where machine milking in herds has been practiced for a quarter of a century. Thousands of dairymen have measured the success of machine milking through several generations in their herd. The evidence they offer has been laying a foundation for an unparalleled interest in machine milking on the part of others. Power milking most certainly reduces the cost of production and from this standpoint alone farmers most eventually consider it. Greater profits in dairying can be attained in two ways, namely lessening the operative cost of the dairy or increasing the output. The employment of a mechanical milker enables a farmer to attain both of these ends. It is not surprising, therefore, to hear a man say when asked how he liked his milking machine, "If I had to do without it I'd quit the cow business."

I put the same question to T. R. Jones who with his father is working two large farms near Arena, Wisconsin. Mr. Jones said, "Father and I came to the conclusion that we were wasting time when both of us sent men to pasture to drive the cows home. We have now worked out a system which enables us to combine our herd. Instead of two men going to the pasture for the cows only one is now required. We house all of the milk cows in one barn and a milking machine is employed to do the milking. In this way we have been able to save the wages of at least one hand."

I asked a county agricultural agent of one of the foremost dairy counties of Wisconsin what he knew about milking machines and his reply was, "I know that the farmers in my county are investing in them more and more every year and they seem to be giving entire satisfaction." Cases like this so generally prevail that it is practically certain more than 100,000 mechanical milkers will be bought by farmers of the United States during the coming year.

Efficient Operation Necessary

Milking machines if properly operated pay from the standpoint of economy of labor. The time spent in milking a herd about equals that spent in feeding and otherwise caring for the animals. In other words, milking is half the work of producing milk. A milking machine is therefore practical on any farm where more than ten or twelve cows are kept. When a man operates a double unit milker he is able to handle twice as many cows as would be the case with hand milking. If he is alert it will not be difficult to connect the machine, care for the milk, and do the stripping. Working in this way a man can take care of twenty or more cows in an hour. On the average dairy farm, it normally requires two men to do the same amount of milking when the work is done by hand. Thus, by employing power it is possible for dairymen to reduce their help, and at the same time increase the size of their herds. Carefully kept records on 100 herds by the Michigan Agricultural Experiment Station brought out the astonishing fact that machine milking reduced the time spent in care of utensils and product fully one-fourth. Frequently, the number of cows in a herd governs the size of the profits of the business and for this reason the use of power equipment has a direct influence on the farm income. From the standpoint of cost of installation a standard outfit entails less expense than the purchase of an automobile or farm tractor. After the initial investment there is no other great expense connected with the upkeep. The useful life of a carefully handled plant is about 12 years, although many machines have served still longer. Good milkers require few repairs and necessitate only a small expense for fuel and lubrication when operated. It has been estimated that a good milking machine will work at 10 cents a day. If in addition to the cost of operation the labor of the operator is considered as being worth 40 cents an hour, the cost of milking 30 cows with the machine should not exceed $375 a year as compared with $875 if hand milking is practiced. It is possible, therefore, to almost pay for the equipment from its earnings the first year.

Farmers who bear in mind that a mechanical milker is designed to work on a living object and adjust it to the habits of each cow in the herd, rarely encounter trouble. Ordinarily, it takes only a few milkings to accustom cows to power milking. When breaking the animals in, some farmers alternate hand with machine milking until the animals get accustomed to the latter. Young animals are easier to break to machine milking than old ones. If the milker in use does not have universal teat cups, care should be taken to use cups of the proper size to fit the udders of the different cows. Every bit of the range and adaptability of the machine to the individual animal should be made use of, especially as the cows advance in the lactation period. Every operator knows whether his cows give down their milk slowly or readily and it takes only a simple adjustment of the machine to fit it to their comfort. The cups should never be placed on the teats without first massaging the udder to get the udder in normal condition and the milk flow started. This is particularly necessary in cold weather. Then the suction should be applied gradually. The machine should be run no longer than is nec-

essary to extract the milk when the cups should be removed as carefully as they were attached. The very best types of milkers will fail to do good work if the operators fail to observe these points. On the other hand, if the machine is properly adjusted to the comfort of the animal, the milk will flow into the apparatus normally. In fact, some of the foremost dairymen claim that the milking machine actually increases milk production. Noted herdsmen are authority for the statement that udder trouble is actually less frequent with properly operated machine milked cows than when the same animals are milked by hand. Many of the finest herds of pure-bred cattle in America even where the animals are on official test are machine milked. As a matter of fact, mechanical milkers are known to work most satisfactorily on high producing individuals having well formed udders. Progressive dairymen who use mechanical milkers make it a point to adapt their herds to efficient machine milkers. Only about three out of four cows in the average herd are perfectly adapted in shape of udder and temperament to machine milking. For this reason breeding for the type of animal which responds to machine milking and the weeding out of animals with irregular shaped udders and nervous disposition improves the herd and simplifies the work of milking.

Mechanical milkers can be installed and work well at all seasons of the year in any barn that is built to comfortably house cows. The equipment should, however, be kept clean and sanitary at all times. I have talked to a number of farmers' wives regarding the amount of time required to cleanse the machine milker as compared with the utensils when hand milking is practiced. In no instance have I been told that more work is expended in cleaning the former if the work is done promptly after use. The teat cups and tubing can be cleansed by lifting them up and down in lukewarm water with the suction applied. The pail can be cleansed similarly to any other utensil. The teat cups and tubing can be kept sweet and sterile by placing them in an antiseptic solution between milkings. Special brushes are supplied for more thoroughly scouring the parts. Most machines are constructed with rounded corners and of a metal which does not rust. When the working parts of the milker are kept clean and sanitary it is not only possible for a dairyman to prevent sediment from getting into the milk but a low bacterial count will be attained as well.

Milking machines are here to stay. They are capable of lightening the work of producing milk without curtailing the milk flow when properly used on efficient dairy animals.

Leaks in the Tractor Engine

(Continued from page 913)

be removed from the groove with a screw driver as shown in Figure 3. When a piston ring sticks on the piston, it is a good indication that too much oil has been used in the engine or the oil may have been of incorrect grade. The tractor operator should pay particular attention to the matter of the use of the right amount of a correct grade of gas engine cylinder oil in the tractor. There is no other point more important in the operation of a gas tractor than "correct lubrication".

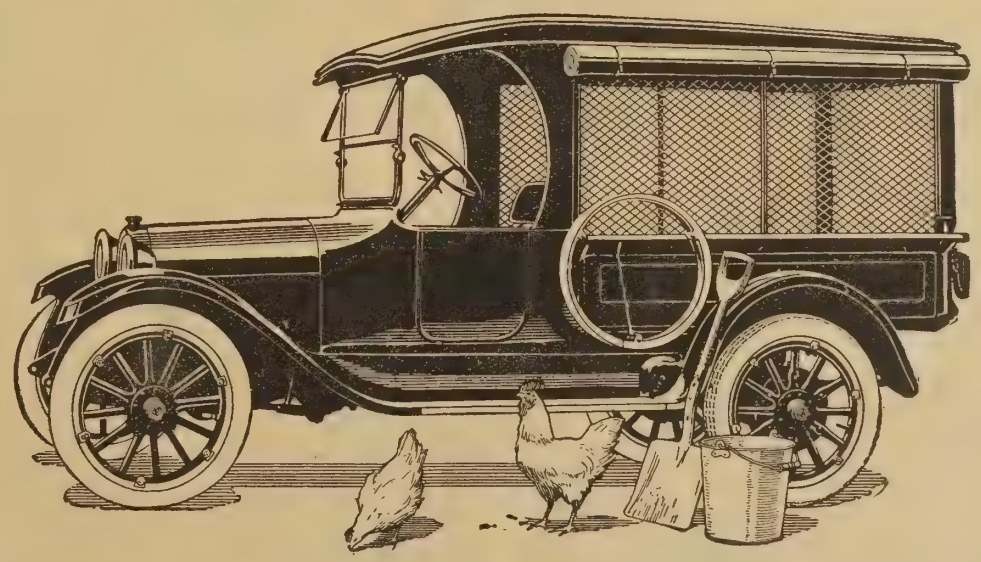
Not only does a leak in a gas engine cylinder cause a loss in power and poor operation of the engine, but a leak has a tendency to overheat when the engine is in operation. At every explosion, a thin live flame shoots through the leak and in this way has a tendency to heat this part extremely hot and may cause preignition, which in turn causes a loss in power and it is detrimental to the bearings of the engine.

In this day of high prices, there is a great need of efficiency in power to operate the numerous farm machines and it is highly desirable that every man who operates a gas tractor, which is coming to be the fundamental farm power, should learn not only to start, steer, and stop his tractor but he should learn the lesson of maintenance and proper management and should learn that it pays to patch correctly.

The simplest way to make sure your body is getting the foods it needs is to use plenty of milk.

DODGE BROTHERS
BUSINESS CAR

The business car pays its way on the farm



It pays its way because the haulage costs are consistently low

It pays its way because it can be kept constantly going on small chores and big chores without running up a heavy bill of expense

It pays its way because repairs are rarely required

It is strong, sturdy, powerful, and equal to a large proportion of all the hauling jobs that are ever done on the farm

November Milk Prices

The following table from the **U. S.** Bureau of Markets' report presents a comparison of the net prices received during November by producers for fresh milk (test 3.5%) f. o. b. local shipping points or milk plants operated by fluid milk dealers:

Sections	Range of Nov. prices per cwt.	Comparison of average prices 1920 Oct.	1920 Nov.	1919 Nov.
United States	$2.45— 5.82	$3.79	$3.72	$3.74
New England	3.50— 5.05	4.29	4.30	4.17
Middle Atlantic	3.56— 4.14	3.86	3.86	3.51
E. N. Central	2.45— 4.09	3.57	3.30	3.63
W. N. Central	2.50— 3.86	3.18	3.24	3.31
South Atlantic	3.26— 5.82	4.43	4.37	4.43
E. S. Central	2.73— 4.68	3.53	3.46	4.06
W. S. Central	3.22— 5.24	4.54	4.59	4.35
Mountain	2.45— 3.82	3.11	3.08	3.14
Pacific	3.05— 4.44	3.97	3.88	3.39

Producers' and Consumers' Prices

The following table shows for certain representative city markets the prices of standard grade milk (Grade B, test 3.5%) received by producers f. o. b. city and paid by consumers during the month of November:

	Producer receives per cwt.	Consumer pays per qt.	Butterfat allowance per lb.*
Birmingham, Ala.	$3.15	$.20	$ .90
San Francisco, Cal.	4.51	.17	.29
San Diego, Cal.	4.71	.19	
Denver, Colo.	2.98	.13	.85

*In actual practice this allowance is made on the basis of a certain price per hundred of milk of a certain test, one-tenth of the price per pound fat being paid or deducted for each one-tenth per cent above or below the stipulated basic test. Where the word "flat" appears in this column, it means that no allowances are made for butterfat content but the milk must not be lower in test than legal requirement and must not be adulterated or skimmed.

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price. In certain cities the prices given apply only to that portion which is considered as the producers' average production, the surplus being either handled by the producers' association or the dealers at somewhat lower prices.

The prices given are here reduced to the comparable basis of 3.5% fat, as different cities vary from 3% to 4% as the basic fat test. To reduce the prices per hundredweight to either a gallon or a quart basis divide by 11.63 or 46.33, respectively.

The prices paid by consumers are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in most cases is for pasteurized milk.

Country Shipping Stations

Prices per cwt. paid at the dealers' country receiving stations or at producers' railway shipping plants are given as follows for November:

New Haven	$4.07	Omaha	$2.50
Washington	3.50–4.19	Newark	3.85
Jacksonville	3.67	Buffalo	3.69
Chicago	3.05	New York	3.85
Indianapolis	2.45	Albany	3.94
Baltimore	3.30	Cleveland	3.35
Boston	4.09	Cincinnati	3.30
Kansas City	2.45–3.45	Toledo	3.30
St. Louis	3.10	Pittsburg	3.50
Lincoln	2.62	Philadelphia	3.81

Retail Prices

The following table gives for a few cities the retail prices of special milk, certified milk, cultured buttermilk, cottage cheese, and cream for November, 1920:

Cities	Special milk per qt.	Certified milk per qt.	Butter milk per qt.	Cottage cheese per lb.	Light cream* per ½ pt.
	Cts.	Cts.	Cts.	Cts.	Cts.
Boston	21.25	28	22	26	16
New York	21	28	12	20	22

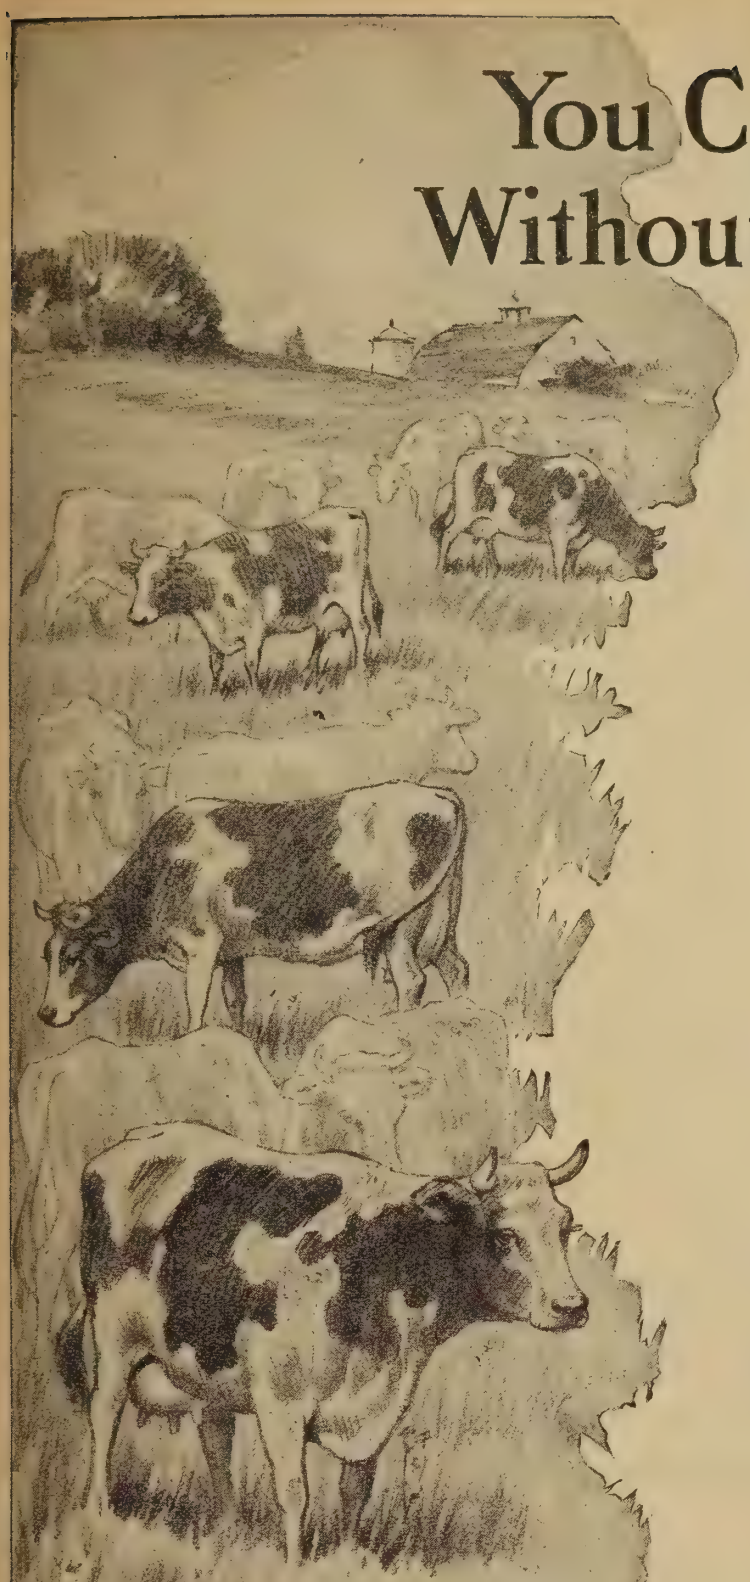
Wisconsin Holstein Meeting

Wisconsin Holstein breeders held an informal get-to-gether meeting at Milwaukee on Nov. 26. The meeting, called by State Secretary Oldham for a round table discussion of state association policies and of the relationship between the state and county associations, was voted a success by the representatives of 21 counties that were present.



The question of local consignment sales and what the state association can do to better those sales was first brought up. Wisconsin undoubtedly has more such sales than any one other state, and while there is no desire on the part of the state association to take over the management of such sales, it does want to better them in any way possible. The discussion finally ended in arrangements being made for a conference of local sale managers with Secretary Oldham, at which it is hoped a definite and uniform policy for most of the sales in the state will be worked out.

A call for Holstein bulls to be sent to the devastated region of France has recently been made by Dudley Waters of Michigan, and the Wisconsin breeders voted to donate 150 bulls, their allotment, and defray shipping expenses to the seaboard.

R. T. Harris, in charge of official testing for the state, reported the progress of the work and asked for the appointment of a committee to represent the Holstein breeders of the state, with whom he could at any time confer on questions relative to A. R. O. work. Such a committee was appointed.

Uncle Ab says: The man who always finds fault with the weather won't have any real indignation when he needs it for a cause that he can do something about.

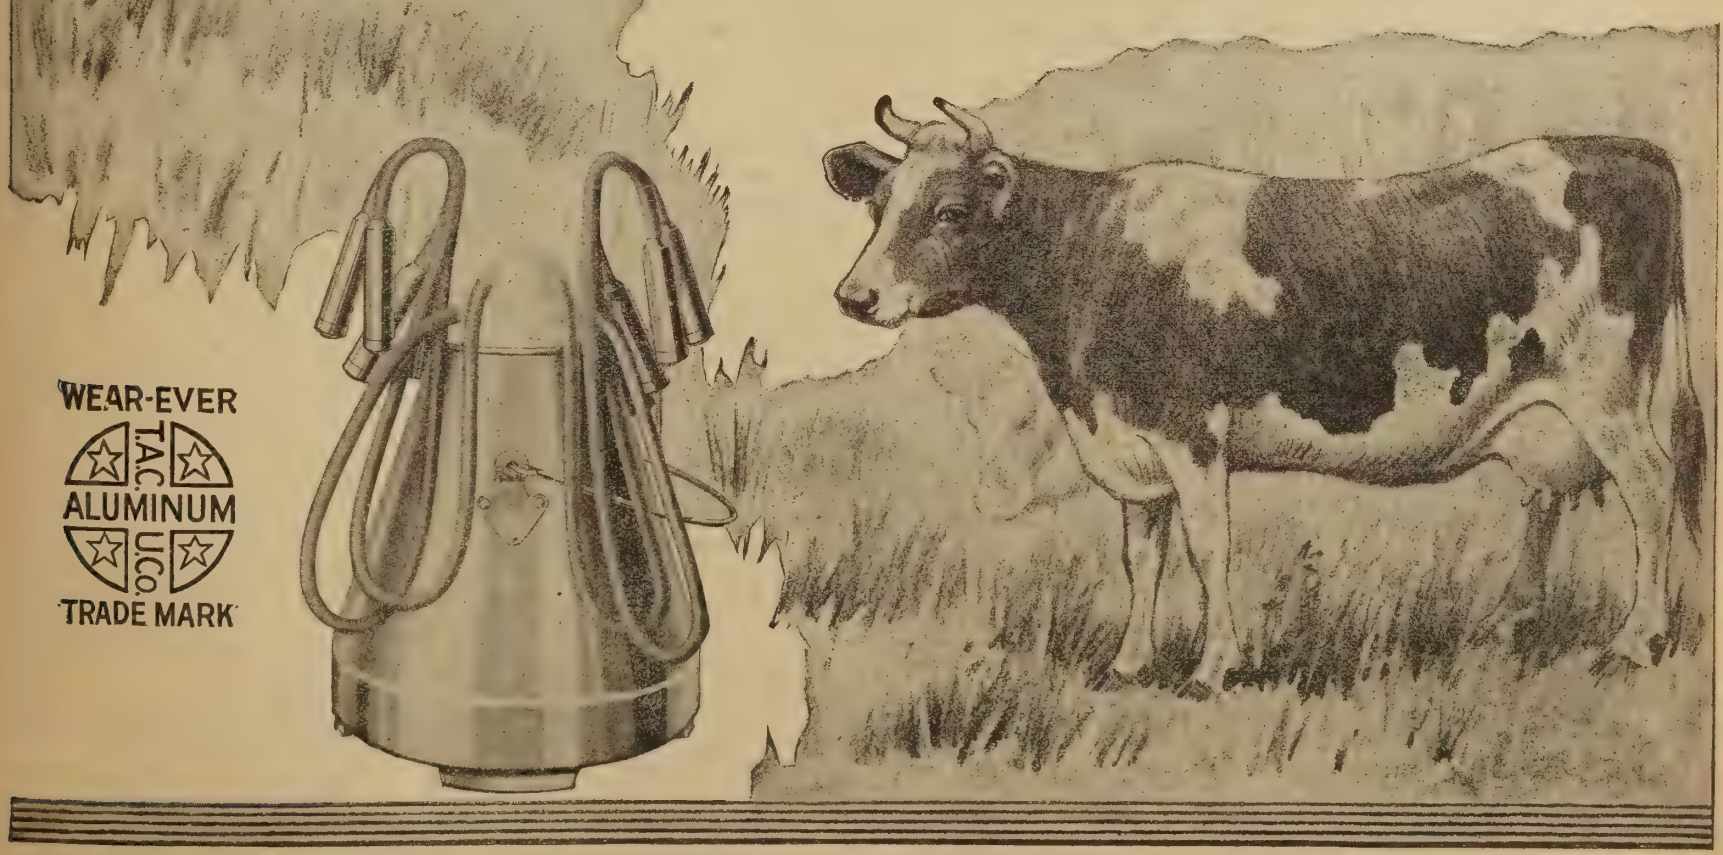
You Can Triple Your Herd Without Adding To Your Help

What Will Be Your Annual Profit If You Do?

That is what the milking machine makes possible; because one man or woman with a milking machine can do the work of three persons milking by hand.

Milking machines that insure the highest grade of milk are those equipped with

"Wear-Ever"
Aluminum Milk Pails



CANNOT RUST and are made SEAMLESS—no places for bacteria to gather. A low bacterial count means a higher price for the product.

"Wear-Ever" Aluminum Pails are easy to keep clean, are light weight, durable and require no tinning.

They are made of the same metal and in the same factory and bear the same trade mark as the millions of **"Wear-Ever"** Aluminum cooking utensils used in American homes.

Dairy Cattle Valuation

(Continued from page 912)

but they must look the part if their value goes much beyond the five hundred dollar mark. Bearing in mind that such animals are sold for breeding purposes, the buyer wants the kind that makes a good pattern for his future herd.

An animal with a very poor conformation is not much sought and will not bring a large price even when backed by good ancestry or showing considerable indication of production. On the other hand, an animal with breed character and pleasing appearance will generally bring all that its breeding will warrant.

Health and Condition

Animals must be up in good condition to sell well as it is very difficult to see through the features of animal form when in the rough. Injuries, defective quarters, and defects of a permanent nature usually bring an animal of exceptional breeding near the common cow in value.

Indications of poor health or disease greatly detract from the value regardless of the good points. Tuberculosis is one of the great price controlling factors among cattle today. An animal, not having been tested, regardless of pedigree or individual merit, will today rarely rise above the $500 mark. There is a growing demand everywhere in this country for tubercular free cattle. Those sold on a 60- or 90-day retest guarantee bring much the highest figures, especially when backed by pedigree and individuality.

Breeding Condition

If a female is of breeding age it is important to know the date of last calving and date of service, if supposedly pregnant. In paying high prices on the basis of the foregoing factors the buyer wishes to be as certain as possible of getting an animal with normal reproducing powers. Reliable breeders will stand behind females which they believe to be in calf at time of sale. Not infrequently high priced animals cause much disappointment and loss by aborting. This is one of the great obstacles today. Eventually breeders will no doubt sell with a guarantee against this great live stock scourge. Reliable breeders in selling young bulls will stand back of the buyer if the male fails to develop his full powers of reproduction.

In case the evidence points to uncertainty with respect to the breeding powers the price paid should be fixed accordingly. If pregnant, the pedigree of the service sire is important. Ordinary females sometimes sell for twice their value if pregnant from the service of an especially preferred sire.

Age

A pure-bred female is worth about 20 to 25% of its mature value at birth, i. e., a new born calf from a herd of about $300 value for the mature cows will be worth about $60 to $75. At six months they are worth about 30%; at one year, 40 to 45%; at two years, 60 to 65%; at three years, 85%; at four years, 90 to 95% and at 5 and 6 years, about 100%, or full value. From this time on they decline in value. At eight years they have dropped only to 85 to 90% of their maximum value. From this time on the decline is rapid, reaching 65% at 10 years, and 20 to 25% at 14 years, when the chance for another calf and a profitable production is not promising.

Naturally other factors enter into the price in special cases. Geographical location may be an important factor, especially with certain breeds. The reputation of the herd and advertising are also matters that cannot be measured. Advertising brings more people into competitive buying, that is, it creates a demand and causes people to want the animals in question.

It is true that many cattle have sold for prices that would hardly seem justified from the standpoint of the factors enumerated. We all know instances where animals brought high prices purely for advertising purposes, for breed boosting, or because of the psychological influence of the sale ring. Some of these, however, have resulted in good. The writer knows of a man without extraordinary means, making his living off the farm, who paid $5,000 for a bull at a big sale. He had no intentions of buying such a bull before that time. Everybody thought he was "stuck" and probably the buyer thought so too, in his sober moments. But he got busy. He tested his cows, advertised, and applied energy and good business sense to his establishment. His bull turned out well and in three years he was able to announce that he had paid for him and he has the bull and the best herd he has ever owned left. Many such high priced animals have proved wonderfully good investments.

In spite of some glaring instances to the contrary, live stock is being bought and sold more and more upon its merits. An animal which has the breed's best blood in its veins, which is nearly perfect in type, in the prime of its life, free from disease, and with the bloom upon it, is most desirable, and it will bring a high price at any time that two or more breeders who recognize such rare traits may come into competition.

Go and Hear Rachmaninoff on the New Edison

NOW you can make a straightforward comparison and find out which is the best phonograph. Rachmaninoff himself, the great Russian pianist, will give you this opportunity.

He has made recordings for one of the standard talking-machines. We are very glad that he has done so. For now you can compare.

Your Edison dealer will gladly play Rachmaninoff's RE-CREATIONS on the New Edison for you. Watch for his announcements in your local newspaper. You *must* hear this most astonishing phonograph comparison,—before you buy your Christmas phonograph.

The photograph, from which this illustration is reproduced, was taken in Mr. Rachmaninoff's home, in New York City. It shows the great Russian pianist playing the Second Hungarian Rhapsodie *(Liszt)*, while the New Edison RE-CREATED his previous rendition of the same composition.

The three music experts who listened from behind the screen, were amazed and astounded at the absolute fidelity of the RE-CREATION to the artist's original performance. Once more, the New Edison's perfect Realism triumphed in the test of direct comparison.

Be sure to look for your Edison dealer's announcements. Hear Rachmaninoff on the New Edison. THOMAS A. EDISON, INC., Orange, N. J.

California Dairy Manufacturers Meet

The fourth annual convention of the California Butter, Cheese, and Ice Cream Makers' Association was held recently at the University Farm, Davis. The convention was well attended. A special feature of the day was the competitive judging contest, in which twenty-one members competed for prizes. The winners were as follows:

L. H. Nielson was the best judge of butter; G. Jaehing, second; and O. Berroth, third. The best cheese judge was Wm. Glass; E. Hyatt placed second; and Wm. Halde, third.

T. J. Harris of the San Francisco Exchange was the principal speaker at the afternoon program. His comments on the butter quality desired on the San Francisco maket proved to be interesting and valuable information for the Association members. J. I. Worswick gave a very instructive description relating to the manufacture and use of various types of thermometers.

C. L. Roadhouse reviewed some of the work undertaken by the Dairy Industry Division of the University of California. Besides giving instruction to a large number of students, and doing extension work, the Dairy Industry Division is conducting experiments with various kinds of wood for butter boxes, cheese mites, butterfat tests for butter, the methylene blue test for detecting milk quality, and recording data on other major and minor projects which are under investigation. Other speakers at the afternoon session were Mr. Inman of the Creamery Package Company and H. S. Baird of the Northern California Milk Producers' Association.

At the business meeting the following officers were elected: President; Louis Diamond; vice-president, J. S. Palmer; and secretary-treasurer, J. C. Marquardt.

Twenty-four members were voted into the association at the business meeting, making the membership seventy-six at the close of the fourth annual session. The banquet held in the evening was the largest and best in the history of the organization. S. H. Greene of the California Dairy Council gave a very interesting account of the dairy industry from an international point of view. The members present received a very vivid impression of the magnitude and importance of the National Dairy Show by listening to its description by Dean H. E. Van Norman.

California. J. C. MARQUARDT.

Portage County, Wis., Guernsey Meeting

The Portage County, Wisconsin, Guernsey Breeders' Association met at Nelsonville, November 20th. The present membership numbers 105. Fifty pure-bred herds are owned by members and the rest are grades. About 60 members were present at the meeting. The officers elected were: L. E. Gordon, Jr., president; E. L. Leppen, vice-president; R. K. McDonald, secretary-treasurer.

It was decided to hold a bull sale December 16th, when some grade heifer calves would also be sold. The annual sale of the association of pure-bred males and females will be held May 25, 1921, at Stevens Point. On the 26th a grade cow and calf sale will be held. A show circuit within the county will be held next fall, from which the winners will be sent to the Wisconsin State Fair. L. H. Gordon was appointed supervisor of this circuit. A. H. Peterson was named to act as Junior Calf Supervisor.

Quebec Ayrshires Sell Well

There was great enthusiasm among the Ayrshire breeders at the Allancroft sale of Ayrshires held at Beaconsfield, Que., on November 24th. This herd is owned by H. Montagu Allan of Montreal. Having certain theories in breeding, he wanted to try them out in Ayrshires and, despite the fact that he was not able to give the herd any personal attention during the war, his manager knew what was wanted and "carried on" at Allancroft. They built up an exceptionally strong herd largely by the use of two sires on good imported and home bred females. The bulls used were Finlayston San Toy and Barwheys Flashlight. The former has 11 daughters qualified in the R. O. P. with most creditable records and has now another daughter in the test that has given over 16,000 lbs. milk in 8 months. Finlayston San Toy was sire of most of the older matrons sold and Flashlight sire of the younger ones. The herd was true to Ayrshire type—large, roomy, fine quality cows and heifers capable of big production.

The herd had show yard winnings in 1914 and a number of good R. O. P. records and had passed successfully the second tuberculin test in the accredited herd plan. This was largely the reason why there was such keen bidding and Auctioneer C. A. Gavin of Huntingdon sold the 43 registered and 12 high grades in exactly 2 hours.

The first twenty animals sold averaged $525. Eighteen cows, 4 years and over, brought $8,295, an average of $460. Forty of the animals sold realized $14,420, an average of $360—the best average at an Ayrshire sale here for some time.

Adam Seitz, the celebrated Ayrshire breeder from Wisconsin, who knows an Ayrshire from the ground up and also her value, was present and was a keen contender for several of the best ones. William Hunter representing Alta Crest Farms, Massachusetts, purchased 5 head. A. E. Fish & Son of Ayer's Cliff purchased several choice ones and R. R. Ness of Howick secured a few of the best. The Experimental Farms secured a prize in Allancroft Ada, out of San Toy, for $800. Seitz and Hunter were both after this heifer and the former chased her to $775. For Allancroft Mildred there was also keen bidding and she was knocked down to Hunter for $750. Mr. McRobbie, manager for A. R. Martin of Bonnybrook, Thetford Mines, Que., pinned his faith to Allancroft Kate and followed her to $650, but knocked down to Gilbert McMillan for $700. One of the surprises of the sale was when Auchenloich Mina was knocked down to R. R. Ness at $675, as it was thought she would reach $800, at least, but her age, 9 years, may have been against her. The sensation among the young things was when the yearling heifer, Allancroft Susanna by Springburn Ringmaster, a heifer of wonderful quality and great outcome, reached $355, and was knocked down to George H. Montgomery, Quebec.

The secretary, W. F. Stephen, opened the sale with a few remarks as did also Mr. McMillan. At the close three cheers were given for Montagu Allan who in responding expressed himself as being well pleased with the result of the sale and encouraged to continue along the lines started and possibly hold such a sale every two years. He reserved 35 head of various ages of "San Toy" and "Flashlight" breeding as a nucleus to build up the herd.

Quebec. W. F. STEPHEN.

Cheese Markets Steady

[Report by U. S. Bureau of Markets.]

The holiday during the week ending Nov. 27 caused somewhat lighter trading in cheese than usual but otherwise reports from markets indicate that business was fairly satisfactory. Early in the week asking prices at primary markets in Wisconsin were generally advanced slightly following the meeting of the Plymouth Cheese Exchange, although there was some hesitancy at following the advance and considerable price cutting actually took place at some country markets.

In the distributing markets trading is still mostly of a jobbing nature and involves small lots. Much of the wholesale buying so far this year seems to have been done in the country. Prices on both fresh and held advanced slightly during the week and the firm tone of the markets was fairly well maintained after the advances although trading became somewhat quieter. Receipts of fresh cheese are becoming lighter, and further decreases from New York State are expected following reports that a number of factories are closing for the winter.

No export business of importance has developed as yet, but there is a noticeably better feeling in that direction. A good many of the trade expect larger export demand after the first of the year. Inquiries for Twins were received during the week, but no actual business resulted, principally on account of a shortage of shipping space. Some Skims have moved for export at around 17c.

The average wholesale prices on American cheese (style Twins) for the week ending Nov. 27, 1920, and for the corresponding week last year, were as follows:

	Week ending Nov. 27 1920	1919
	Cts.	Cts.
New York	28.0	31.7
Chicago	25.5	31.1
Boston	25.7	32.7
San Francisco	30.3	29.9
Wisconsin Board	25.3	31.4

The receipts of American cheese at the four markets first given and at Philadelphia totaled 3,026,240, lbs., as compared with 3,300,581 lbs. a year ago, and 3,309,126 lbs. last week.

Waupaca Co. (Wis.) Holstein Sale

Waupaca County Holstein Breeders held their first annual sale at Weyauwega, Wis., November 24, selling 45 head for $10,025. A. E. Smith topped the sale with a 3-year-old granddaughter of Pontiac Aaggie Korndyke that went to L. L. Raisler, Wisconsin, for $410.

Mack & Pohlman did the selling with F. H. Everson in the box.

Following is a list of those animals that sold for $250 or more and buyers:

Robert Ferg, Wisconsin	
Clara Pontiac De Kol Korndyke	$310
H. C. Johnson, Minnesota	
Mechthilde Canary Alcartra 2d	$310
Oscar Pryse, Wisconsin	
Allie Mona Hengerveld	$380
John Hofberger, Wisconsin	
Countess Juliana Belle De Kol	$290
Emil Seibel, Wisconsin	
Fobes Pontiac Korndyke	$260
J. L. Dopp, Wisconsin	
Maple Grove De Kol Belle	$285
C. L. Raisler, Wisconsin	
White Star Bonnie	$410
May Johanna Pietertje	280
Canary Fobes De Kol Homestead	350
Harry O. Allen, Wisconsin	
Ponderosa Jessie Johanna 2d	$320
Lewis Bauer, Wisconsin	
Ponderosa Lilly Fobes	$355
Mike Paltzer, Wisconsin	
Unnamed Male	$350
F. W. Prill, Wisconsin	
Netta Pontiac Colantha Lass	$400
John Rolland, Wisconsin	
Johanna Alegra De Kol	$325

The engine stalled but the wheels didn't spin

The driving wheels of a new one-ton truck were equipped with Caterpillar tires.

The truck was then loaded to capacity and driven into soft, sandy plowed ground.

Again and again this test was repeated and each time the engine stalled but the wheels did not spin. The Caterpillars stuck to the ground with bulldog tenacity.

This is just an example of every-day Caterpillar performance. They get traction on almost any kind of road. They carry the truck wherever the engine will pull it.

Caterpillars will solve your traction troubles. And they will give you almost double the mileage of any other truck tire you can buy.

Butter Markets Break Sharply Under Light Demand

[Report by U. S. Bureau of Markets.]

The market at New York for the week ending November 27 offers an excellent example of the manner in which a shortage of fine butter will support an otherwise weak and unsettled market often for a period of several days. Examples of this sort have not been lacking on the general market at any time this year, but this is a particularly good illustration. Chicago started the decline last week, Boston weakened as early as Tuesday, and Philadelphia was supported only by the steadiness at New York.

Foreign Butter Aids Weakness

The arrival of two steamers carrying about 6,000 casks of Danish butter added to the weakness of the domestic market. This Danish butter, however, has practically created a market of its own and when prices on domestic fell away, Danish butter sold as firmly as ever. Prices on fresh Danish ruled around 55 to 58c and on storage at 51½ to 56c. New Zealand butter scoring from 88 to 92 was reported on eastern markets. Sales were made at New York at 62c for the best. Canadian butter was also offered at New York and sales were reported up to 61c. The large stocks of Argentine butter now in this country are being moved with great difficulty because of poor, irregular quality and lack of demand. There has been a little improvement in exchange rates the past week and some traders are still looking for export orders for domestic butter, but as yet none of this business has materialized.

Net losses in quoted values were high during the week, the New York and Chicago markets closing at prices 8c and 6c respectively, below the prices of the previous Saturday.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending November 27, 1920, and the corresponding week last year were as follows:

	Week ending Nov. 27 1920	1919
	Cts.	Cts.
New York	62.4	73.3
Chicago	55.0	70.9
Philadelphia	63.6	72.3
Boston	59.2	70.8
San Francisco	53.7	64.6

The receipts of butter at these markets for the week were 6,065,074 lbs. as compared with 7,261,831 lbs. a year ago and 6,001,680 lbs. last week.

PAT. 7-2-07
ANTI-COW-KICKER
Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensible for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. HOARDS DAIRYMAN JUNIORS

Junior Club News From Sheboygan County

Edward Crosby and Marion Rock Get Special Mention

Three years ago Edward Crosby of Waldo and Marion Rock of South Prairie were pioneers in calf club work in Sheboygan County. When, for the first time in the history of the county fair, entries were made by members of calf clubs, Marion captured the first prize with her heifer and Edward took second honors. At that time few people knew what the calf club was, or realized that it would grow to its present proportions. Neither did they know what an important factor the calf club would become in raising the standards of dairy cattle in the county, and, what is no less important, the parents of these youngsters never imagined what the club would mean to their children.

Keep Up Consistent Work

As the calf club work has grown in the county with an initial exhibit of thirty-two calves three years ago to an exhibit of nearly a hundred calves last year, so have Edward Crosby and Marion Rock continued to grow with it. Each year they have exhibited calves and each year Miss Rock has captured a prize while Edward, though losing out the second year, staged a come-back and captured first prize in the heifer class at the last county fair.

More Than Prize Winners

We believe the boys and girls of Sheboygan County who live in the country, and the grown-ups, too, for that matter, will be interested in just a peek at the history of pioneers of of calf club work here. Looking at the illustration you will find pictured with Miss Rock the calf and the mother of the calf she exhibited this year. The mother is the first she raised in calf club work and on which she received first prize. It is here that we like to emphasize the fact that the winning of the prizes is not the important thing in this work, but it is rather to continue right along giving the same careful attention to the animal that it received while being groomed for the live stock show. You cannot help but note that Miss Rock has taken good care of both the cow and the calf. Doubtless you will be interested in knowing that the cow pictured here made more than nineteen pounds of butter in seven days as a junior two-year-old and she has a number of full sisters who have also averaged more than nineteen pounds as two-year-olds. Both mother and son are prize-winners at the county fair and, with his grandam having a record of more than twenty-eight pounds as a four-year-old, it can be readily seen that the young fellow is more or less an aristocrat so far as breeding and type are concerned.

Edward Makes Fine Progress

Three years ago Edward Crosby bought a young heifer calf from Gust Brickbauer of Elkhart Lake, paying Mr. Brickbauer $125 for the animal, the animal being backed with excellent breeding on both the dam's and sire's side. It is this calf, now grown, that is pictured here with Edward.

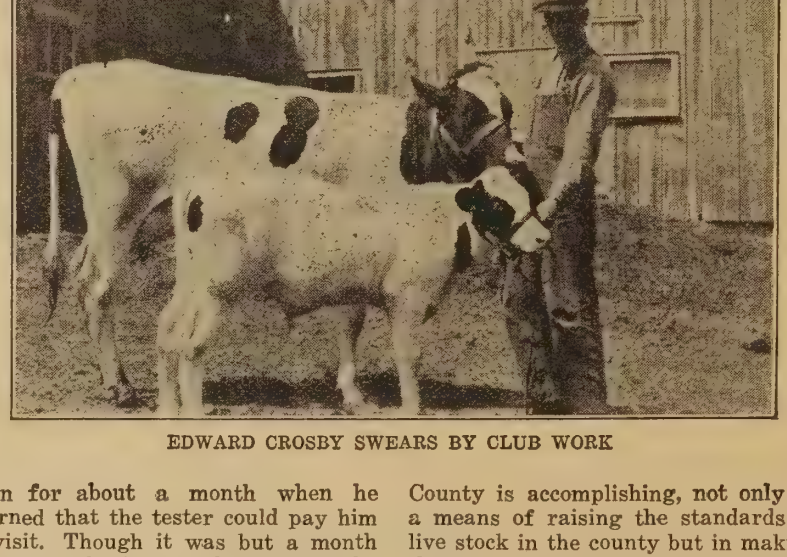
He was unfortunate in having her freshen a little under two years. Being anxious to put a record on his heifer he made an application for an official tester. Milking the animal four times a day he was prepared for the coming of the tester when he received word that the tester could not come.

Makes 17-Yearling Record

Putting the heifer back to two milkings a day he continued on this plan for about a month when he learned that the tester could pay him a visit. Though it was but a month after freshening and despite the changing from four to two and back to four milkings a day, Edward made a seventeen-pound yearling record with his heifer.

Sells Bull Calf for $310

Perhaps Edward was unfortunate in another respect, in that the first calf from his heifer was a bull, but he had shown forethought and wisely bred his heifer to a very high record sire, realizing that the heifer might give birth to a bull calf for which he would naturally want to receive a good price. When this calf, shown in the picture, was about a month old, Edward disposed of him to one of the neighbors, receiving $310.



With this money he bought another heifer calf which he turned over to one of his brothers to raise, later placing it in the calf club contest.

Calf Every Year

Edward has bought a pure-bred heifer every year since calf club work has been instituted and gradually but surely he is replacing the grade cows on the farm with pure-breds of a good type backed by official record.

Do you think that Edward's father is going to have a hard time keeping his son on the farm? The question is a pertinent one, one that is of interest to everyone who wants to see the business of farming placed on a basis whereby it will be more attractive to the farm boy, and as the success of all of our business and all of our jobs is more or less dependent upon the success of farming the question is naturally of interest to all of us.

The story of Marion Rock and Edward Crosby is a mighty fine example of what the calf club of Sheboygan County is accomplishing, not only as a means of raising the standards of live stock in the county but in making the job of farming interesting to the boys and girls best fitted to do it.—Plymouth Reporter.

EDWARD CROSBY SWEARS BY CLUB WORK

MARION ROCK WITH HER HOLSTEINS

Junior News From Harford County, Maryland

Harford County boys have been very successful in their judging work in that three boys from this county won the first place at the state fair, among the sixteen other teams represented, and were successful in having two boys among the first six boys making the best record. These first six boys making the best record at the state fair were chosen to constitute a preparatory team to go to the National Dairy Show. When three boys were selected to go on this team, two Harford County boys were fortunate enough to be placed on the state team. Assistant County Agent, W. C. Snarr of Harford County, accompanied the boys on the trip to Chicago. The boys won fourth place in the junior judging teams.

While these boys were at Chicago, the boys who were not fortunate enough to go on the trip to Chicago, did not lose sight of the fact that it was necessary for them to do preparatory work in order to make the team the next year. To this end a judging contest was staged at the Harford County Fair where 28 boys took part in the judging of Guernsey cows, Guernsey bulls, Jersey cows, Durc hogs, and Berkshire hogs.

The Harford County Fair Associa tion offered liberal prizes for thes junior judges. The Highland Clu was fortunate enough to win firs place, Bel Air second, and Perryma third. The boys are being give every opportunity to make good i their judging work. This year the exhibited seventy head of mature hog and about 65 head of pigs and tw calves among the live stock. It i hoped that next year even a large number of hogs will be exhibited, in cluding at least thirty pure-bre calves which will be given out in pure bred calf club work.

B. B. DERRICK, County Agent.

A Jersey Calf Club Wins a Wisconsin

HOARD'S DAIRYMAN JUNIORS:—Th history of the Mondovi High Schoo Calf Club dates back through severa years of active competition in junio agriculture. Last year a high schoo judging team from this little Buffal County city won over all agricultura high schools in Wisconsin. Ever sinc the first baby beef exposition at Mad ison in 1916, we find that live boys an girls from this live stock center hav taken part. However, this particula paper is concerned with Mondov since it gave up the idea of being th draft horse center of the state an began to pay more attention to th dairy cow as a mainstay of its leadin industry.

Late in the winter of the past yea Mr. Walter L. Houser, president o the Wisconsin Live Stock Breeders Association, took his neighbor, James Dillon, to one side and suggested tha a Jersey calf club was an absolute necessity to put Buffalo County at the head of the territory that the little fawn butter cow had mapped out fo herself in the western part of the state. Money was raised with which to purchase fifteen head of calves for boys and girls most interested in Jerseys. The two above named men, after some search, went down to Fred Stubley's Jersey farm where fifteen baby calves were purchased at a very nominal price, considering that they were mostly of straight island breeding and were all sired by either Kilda's Royal Majesty or his sire, Golden Maid's Viscount.

Throughout the spring and summer Mondovi Jersey enthusiasts watched the progress and development of the junior show men and show women who took the most faithful care of their charges. Shortly before the state fair at Milwaukee, show blankets were bought for each calf, not cheap covers, but uniform tan canvas affairs with name of the club neatly stencilled on both sides. After clipping, brushing, and grooming, an elimination contest was staged where the best of the fifteen calves were taken aside; then additional calves of the same quality and uniformity were added to make up the fifteen to represent the county and state at Milwaukee.

At the latter show for four or five years past, due to the efforts of Professor T. L. Bewick, state club leader, the boys' and girls' calf club exhibit has been one of the most interesting features of the fair. This year two hundred and ten dairy calves stood around the ring of the judging pavilion while Judges Van Pelt and Axel Hansen rendered their decisions.

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am ——— years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. ——— State ——— R.—

THE JERSEYS WON THE CLUB PRIZE

The two judges, together with Mr. Moscrip, had reckoned with Wisconsin junior farmers earlier in the week in the open classes and knew that many had out-stripped their dads with calves of quality. Stanley Melrose of Mondovi had won first on a senior bull calf called Ethelwold Warder, in the open class; he won first over all breeds in the senior division in the club class. Ralph Seyforth lead his little dark fawn heifer up to the head of a line of twelve juniors and took his stand just ahead of the peer of Wisconsin show men, Jack Dixon of McClenahan & Dixon. Margaret Dillon stood third in the senior calf division of the open class and her fellow schoolmates, Wesley Smith and George Helwig, stood better than sixth in the same division. The above winnings indicate that the Mondovi Club had quality and type; Jersey uniformity added the needed dairy essential to place this calf club first over all other groups of fifteen calves in the great arena of over two hundred club calves.

The Winnings

Junior Jersey heifer calves—1, Ralph Seyforth; 2, Julius Hangland; 3, Charles Wittwer; 4, Harley Knight; 5, Aubrey Helwig; 6, David Bartlett; 7, Percy Gullickson; 8, Margaret Dillon; 9, James Hill; 10, Iva Viola Johnson.

Senior Jersey heifer calves—1, Aubrey Helwig; 2, Margaret Dillon; 3, Wesley Smith; 4, George Helwig; 5, Dorothy Helwig; 6, Olive Wilms; 7, James Anderson; 8, Kenneth Evjen. (Four others shown.)

Senior bull calves any breed—1, Stanley Melrose (Jersey); 2, Reuben Johnson (Jersey). (Sixteen senior bulls shown.)

First prize group of fifteen calves from any one club—First, Mondovi High School Jersey Calf Club.

Wisconsin. G. W. VERGERONT.

Junior Letters

Hoard's Dairyman Juniors:—I live on a 283-acre farm and we have 4 horses and a tractor and 2 milch cows and 4 heifers. We have about 200 Minorca chickens and 7 Bantam chickens and 2 White Leghorn chicks. One of them is mine. I have 2 Pekin ducks. We have 15 geese and one of them is mine and we have one ewe lamb.

My letter is getting long so I guess I'll close. If any of the juniors wish to write I will be glad to answer them. My address is R. 2, Strawberry Ridge, Pa.

Fannie Linskill.

Hoard's Dairyman Juniors: I live on an 80-acre farm 2½ miles south of Green Forest, Ark. I have a calf which is 16 months old and looking fine. We have 18 head of cattle which are all Jerseys. We are milking 8 now and sell cream. We have 2 mares and 3 mules. I have 4 pigeons, 1 dog, and 1 cat. My dog's name is Rover and my cat's name is Joe. My father has a 30-ton silo.

I have 4 sisters and one brother. Two of my sisters and I go to school at Green Forest. One of them is in the eighth grade and the other is in the fourth. I am in the sixth grade. I am 13 years old.

Arkansas. Onnis Youngblood.

Hoard's Dairyman Juniors:—I have one grade Holstein heifer I bought from my father for $10. The regular price was $25 when it was born but papa gave it to me for $10. And I have a full blooded Berkshire pig. I tried to put some rings in 3 of the pigs' noses.

We have a pedigreed bull and 27 cows with the calves and 5 horses. We are going to get some chickens pretty soon. We have only lived on our farm of 320 acres since last spring.

I am 11 years old and am in the fifth grade in school. My calf is 3 weeks old this Saturday.

If any of the juniors wish to write to me I will be glad to answer their letters. My address is Gully, Minn. Archie Currie.

Hoard's Dairyman Juniors:—We are milking five cows. We have three yearlings and three calves, four horses and three colts, and two sows, ten spring pigs, and three last fall pigs. We butchered three pigs today. We worked 120 acres. Papa and I did the work on the farm this year.

I am ten years old and am in the fifth grade at school. I wish that some of the juniors would write to me. My address is R. 3, Flint, Mich. Courtland Hugan.

Hoard's Dairyman Juniors:—I have a grade Ayrshire calf. I have named her Josey. I am now in the seventh grade. For studies, I have spelling, history, arithmetic, geography, English, and reading. I hope some of the juniors will write me. My address is Box 134, No. 1, Warren, Maine. Merrill Payson.

Hoard's Dairyman Juniors:—I am a boy of 12, living on a 100-acre farm in Northern Wisconsin. I help with the chores and can help in the field driving machinery, etc. We have six cows that milk at present and I help milk nearly all the time. Pa gave me a calf for milking. She is not a full blood. Can you guess her name. It is "Sweat Heart". We don't get a very large cream check, as we do not patronize Mr. Oleo, but we surely patronize our cream and butter.

I have completed the common school and am intending to take up higher grades in our neighboring town. I live 2¾ miles away from town.

I would like to hear from boys in the western states.

Wisconsin. Palmer Hanson.

Hoard's Dairyman Juniors:—I live on a farm of 160 acres. We have 17 head of cattle, 5 head of horses, and 10 hogs. I hope some of the juniors will write to me.

South Dakota. John F. Feeney.

Hoard's Dairyman Juniors:—I am eleven years old and in the sixth grade. Our teacher's name is Miss Holle.

I live on a 100-acre farm and like cattle and other dumb animals very much. We have 14 milk cows, six of which are dry, and one pure-bred bull whose name is King Beryl Korndyke.

I have six ducks. I am going to have ducks again next year until I have to buy a calf.

Wishing all the juniors good luck. Hoping some of the juniors will write to me. My address is Route 3, Box 13, Baldwin, Wis.

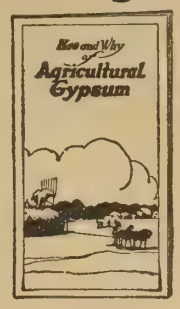
Walter D. Klanderman.

Hoard's Dairyman Juniors:—I live on a farm of 126 acres. I am eleven years old and in the 6th grade in school.

I have a registered Holstein cow. I bought her two years ago. She will be four in January. I paid $150 for her. We have 11 milking cows and 9 calves.

I have 35 rabbits now. I would like to have some of the juniors write to me. My address is Sunny View Stock Farm, Route 3, Howell, Mich. William Gilkes.

Hoard's Dairyman Juniors:—We have a cow, a horse, and some chickens and a dog. That is about all the animals we own, but that doesn't stop me from being a junior. Our cow is a full blooded Jersey and our chickens are Plymouth Rocks. My brother tends to the horse and I tend to the cow. We ride to school in busses. There are five busses that go to Gaines School.



I did not trap much last year but will trap more this year.

We have a county feeding club.

I play in the high school band. I play a clarinet. There are 22 members.

Michigan. Harold Bronson.

Act immediately. E. M. WEAVER, Marysville, Ohio.

Milk a Factory Lunch

In modern factories an increasingly ·mmon sight is a push cart loaded ·th half-pint milk bottles being heeled down the aisles about the iddle of the forenoon. The Dairy ivision of the United States Depart- ent of Agriculture has been doing uch educational work on the value milk as a food in the factories with- the past 18 months, and the amount milk now being drunk by factory nployees is good testimony to the ct that the beverage is all that is aimed for it.

The conditions found in one ringfield, Mass., factory which has 0 employees are typical of many her places. The milk specialist in at county spoke to the factory rce, which consists of both men d women, during the latter part of ly. The manager stated that he d been considering the proposition d was willing to have milk distri- ted throughout the factory during rking hours. The next day the an was put into operation. The lk costs the company 4 cents a half- nt bottle, and to cover the cost of stribution was sold for 5 cents. For e first day 100 bottles were or- red. This proved insufficient and 0 were ordered for the second day. is still proved too small a quantity, d 500 were ordered. After a week two, 700 bottles a day were being nsumed. In August the price of e milk was raised to 5 cents a bot- , and 6 cents was charged the em- yees for it. There was a falling in the demand; so the manager, convinced of the value of the lunch to the men and women, put the price back to 5 cents; and the factory paid for the cost of distribution.

The efficiency of the force is much increased by the milk lunch, the manager states, for many of the men come to the factory having had no breakfast. Less time, too, is lost from the machines than when the men left them and went to their lockers for sandwiches.—U. S. Department of Agriculture.

Land Clearing and the New Settler

Perhaps the first effect of cleared land on the new settler is the inspiration it gives. Like many before him, he hauls his household goods, machinery, etc., out to the new farm-to-be, unloads, and begins work. He clears up around the house, puts in a garden, erects a little stable, and starts developing. He looks out over an uninviting view and resolves to make it attractive and profitable.

Getting rid of the brush, cutting, piling, and burning it probably is new work. But every blow of the axe and every stroke of his scythe overcomes an obstacle preparing the way for the things we need to eat and wear. A man's job in a real man's country.

But every brush pile set aflame and every stump blown high celebrates an event today in which he himself is the principal actor. He meets all the grime and hard, muscular work of the game. If so situated that he does not have to work at outside employment, every day's labor shows a greater amount of land available for crops. That increased acreage is his inspiration. He is conscious that he is doing a work without which there would be no progress in building a bigger and richer state.

Another effect of cleared land on the new settler is the superior security he is able to present for a loan. It too often is true that in the early development period when he is most in need of a loan he may have difficulty in getting it. But we are making progress in remedying this condition. More money is coming into the country as more outlets are found for mortgages on partly improved farms. This increased acreage of cleared land on the settler's part not only enhances his security, but the fact that he has increased it is evidence that he is a worker and demonstrates his ability to carry a loan.

Bring out the yard-stick! Chalk it off in dollars and cents instead of inches and feet. Measure for us the worth to the state of the early pioneer in southern Wisconsin. They are not all gone, not yet—but they are fast dropping away—brave-hearted men and women who migrated to Wisconsin, to get it ready for you and me. They, too, built strong log cabins, and killed deer and bear, supporting themselves on scant fields from which they had driven back the forest with the axe and fire.

Their efforts are being repeated in Upper Wisconsin. The last two years more than 3,000 families located there to build farms. The men and women who are hewing out homes for themselves in Marinette and other counties may well be said to be doing their duty to posterity.—From address by B. G. PACKER, Director of Immigration for Wisconsin, before meeting celebrating the clearing of 1,800 acres of stump land in Marinette County, Wisconsin.

There Was Room at the Top

Mr. Farmer, has it ever occurred to you that a Silo is an investment that brings bigger returns than any other stationary building on your farm, considering the cost of same, the space it occupies, the amount of feed you can store, the extra profit it earns, the ease of feeding in cold weather, and there are many more reasons why you should consider the

"Acme Brick Silo"

It's the last word in silo construction, as it will improve in strength and looks. It will stand wind, fire, heat and cold and any requirement it is put to. Investigate before buying.

The Contributions of Science

The greatest material benefits the world has received have come from the laboratories of the scientists. They create the means for accomplishing the seemingly impossible.

Science, after years of labor, produced the telephone. From a feeble instrument capable of carrying speech but a few feet, science continued its work until now the telephone-voice may be heard across the continent.

In February of 1881 a blizzard swept the city of Boston, tearing from the roof of the Bell telephone building a vast net-work of 2,400 wires. It was the worst wire disaster the Company had sustained.

Now through the advance of science that number of wires would be carried in a single underground cable no larger than a man's wrist.

As the fruit of the effort of science greater safety and greater savings in time, money and materials are constantly resulting.

And never before as now, the scientist is helping us solve our great problems of providing Telephone service that meets the increased demands with greater speed and greater certainty.

Description and prices sent on application. 300,000 of these ear tags have been sold without adverse criticism. 500 of these BullStaffs are used by the best breeders in the business.

H. A. Meyer, Syracuse, N. Y.

Middlesex Meadows' Quartette

Middlesex Meadows Farms, Massachusetts have lately completed four very meritorious Ayrshire Advanced Registry records. The members of this worthy quartette are Lucy Webb, junior two-year-old, Maple Leaf Jean, six-year-old, Freda of Elmwood, eight-year-old, and Nancy Whitehall, five-year-old. Lucy Webb produced 13,524 lbs. milk, 568.47 lbs. fat; Maple Leaf Jean, 16,271 lbs. milk, 614.69 lbs. fat; Freda of Elmwood, 18,502 lbs. milk, 753.45 lbs. fat; while Nancy Whitehall topped the list with 22,075 lbs. milk, 858.77 lbs. fat. The average production of this quartette is 17,593 lbs. of milk, 698.84 lbs. fat.

Lucy Webb was bred by Middlesex Meadows and is out of Rosella Webb a great producing dam. Maple Leaf Jean is not only a big producer but a great show cow as well, being champion at Toronto in 1919 and winner at many of the state fairs. Freda of Elmwood has also been a prize winner. Nancy Whitehall holds the junior four-year-old world's record in milk production.

Captain Higginson is developing a great herd of producing Ayrshires at his Middlesex Meadows Farms, Massachusetts and at Sheldon Farms, New York. He is ably assisted in this work by his capable superintendent, W. R. Coutts.

Vermont. J. G. WATSON.

National Board Calls Meeting for St. Louis

The National Board of Farm Organizations has issued a call for a national convention of agricultural co-operative organizations throughout the United States to meet at the Statler Hotel in St. Louis, Missouri, December 16, 17, and 18. The purpose is to gear up existing farmers selling and buying machinery and set in motion a national movement to meet the acute and distressing needs of agriculture. The invitation is being extended at the request of the National Farmers' Union.

"The purpose of the convention is for action," wires Charles S. Barrett, who is now starting on his seventeenth year as President of the National Farmers' Union. This sentiment will meet with the approval from farmers everywhere who are facing disaster as a result of the recent declines in farm prices.

The total turnover of the agricultural co-operatives is enormous—several billions annually—and co-ordinated effort on the part of the various organizations now engaged in the marketing of wheat, live stock, cotton, and milk is one of the greatest importance. Farmers' unions, equities, milk producers' associations, granges, gleaners, farm bureaus, and other groups are all invited to participate in the coming meeting. Various committees now working on the grain question will have opportunity to meet and harmonize their programs in case it may appear that there now exists some conflict of opinion as to procedure.—CHAS. A. LYMAN, Secretary.

Jefferson County (Wis.) Holsteins Average $309

Members of the Jefferson County, Wisconsin, Holstein Breeders' Association offered 74 very good individuals in their first annual sale held November 19 at Lake Mills, Wis. The entire lot sold for $22,540, an average of $305, with $2,125 the top figure. C. L. Mulks & Son of Wisconsin paid this for King Segis Pontiac 28th, a yearling son of King Segis Pontiac from Queen Juliana Dirkje, the first cow to produce over 1,000 lbs. butter as a 3-year-old. The bull was consigned by John L. Fisher.

Carnation Stock Farms consigned the highest priced female, Beauty Pietertje Prince Segis, a 2-year-old daughter of Beauty Pietertje Prince from a 27-lb. dam and in calf to Avon Pontiac Echo.

Mack & Haeger did the selling with F. H. Everson in the box.

Following is a list of all animals bringing $300 or more and buyers:

Earl Pierce, Wisconsin	
Colson Ormsby Hengerveld De Kol	$320
Longfield Canary De Kol	325

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Development of the Fetus

After conception has occurred the ovum descends into the uterus and the embryo then gradually develops. Toward the twelfth day in the cow the ovum measures from one-third to one-fourth of an inch in diameter and is composed of four structures or layers contained one within the other, three of which are complete. They are: The yolk membrane and the originating tissue or mass, called the blastoderm, divided into an external, middle, and internal layer. By gradual modification of these embryonic layers form the various organs and enveloping membranes or sack of the fetus. The internal or mucous layer forms the epithelium of the intestines and glands, the respiratory apparatus, the kidneys, and the bladder. The middle layer develops the principle vessels of the fetus and the locomotory organs and from the external or serous layer originates the epidermis and organs of sense. Each layer furnishes in the course of development both the inner and outer parts of the fetus. The inner layer forms the umbilical vessicle filled with granular fluid for the nutrition of the fetus.

The allantois next forms. It has two sacs, the inner composes the true allantois, or inner sac urachus which is small and represents the fetal bladder and the outer which is larger and composes the true allantois, or inner sac of the embryo. The outer envelope is called the chorion and exactly fits the inner surface of the uterus and attaches to its cotyledons or "buttons" through which nourishment is derived from the coa. The amnion is the second envelope, included within the later and contains the fetus; then comes the allantois which has two layers which are spread over the outer face of the amnion and the inner surface of the chorion. The placenta are tufted tissues which graft the fetus to the mother and the umbilical cord, or navel cord, is composed of vessels that attach the fetus to the envelopes which contain it. The amnion or second complete enveloping sac secretes the liquor amnii, a fluid which bathes the fetus. This fluid favors movements of the fetus and serves as a buffer between it and the dam and influences from without. It also preserves an even temperature and has other important functions. The allantois also contains a fluid which at first doubtless helps to nourish the fetus but toward the end of pregnancy is largely composed of urine from the fetus and is brown in color.

When the fetus of the cow is about 12 weeks old it measures 5½ inches; at 13 to 20 weeks, 12 inches; at 21 to 32 weeks, about 2 feet; at 33 to 40 weeks, 2 feet or more according to breed and uterine nourishment. Hairs are seen on the fetus of the cow at the third month. In the cow the maternal cotyledons number 60 to 80. In to their crypts the villi of the chorion graft and between them and the maternal cotyledons is always to be found a small quantity of thick, white milky-looking fluid, called cotyledonous or uterine milk. The fetus does not directly take nourishment from its dam.

Acute Indigestion

Would you please state the best remedy for cows that got an overfeed of apples? They seemed to be very weak, some could not hold their feet, their noses would sweat, and they had no fever up to the time of their death.

Howard City, Mich. F. S.

Gorging upon apples might cause fatal bloating or acute indigestion, but we cannot decide from your description just what was wrong. In such a case treatment would consist in giving stimulants, such as aromatic spirits of ammonia, nitrous ether, and nux vomica in water and if necessary followed by small doses of barium chloride and tartar emetic. A trained veterinarian should, of course, be employed in so serious a case.

Impotent Bull

I bought a Holstein bull a short time ago and he seems to be sterile. He is rising two years old. His sterility is no doubt due to being put in service too young. He is keen and in good flesh. He is very well bred and am anxious to know if there is any chance of his ever being of any value.

Canada. W. M.

As cows often are to blame in such cases the bull should not be considered impotent unless it has been found that conception follows the service of other bulls. If the bull is a confirmed masturbator you might as well castrate him or send him to the butcher. If he has not that vice he may become potent, in time, if you retire him from service and put him to steady work in harness or a tread power, provided there is no organic disease of the testicles.

Why was the maiden all forlorn?
Because her cow had a crumpled horn.
If she had raised that bossie right,
And fed the heifer morn and night
With bran and hay and silage corn,
She wouldn't have had that crumpled horn.

Jack and Jill went up the hill,
With light and lively step,
A balanced breakfast gave them speed,
And health and strength and pep.

Hood Farm Abortion Remedy

JAS. SCULLY, Box 109, Pomeroy, Pa.

"Carbola-Clean" Buildings

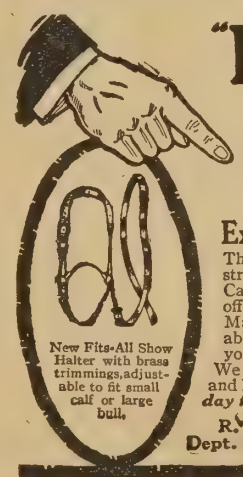
means that walls and other surfaces offer no harboring places to contagious disease, lice, and mites. It means sunny-sweet interiors—light and wholesomeness. It means healthier and more vigorous cows, hogs and hens. It means fewer losses through death, fewer non-producers, fewer low-producers. It means a better profit on your investment—more money in your pocket.

CARBOLA
The Disinfecting White Paint

a snow-white paint combined with a germicide many times stronger than pure carbolic acid, is the standard of sanitation on thousands of the best kept farms, large and small, and at leading agricultural colleges and experiment stations.

Carbola helps prevent the start and spread of contagious diseases that affect herd or flock—glanders, contagious abortion, roup, white diarrhoea, canker, etc.—and kills lice, mites, fly eggs, etc., besides greatly increasing the light and general evidence of cleanliness. Carbola—which is mixed with water and ready for use in less than five minutes—gives you quickly a paint and disinfectant to apply in one operation instead of two, saving time, labor, and money. There is no straining or waiting, and no clogging of sprayer as there is with whitewash. No peeling or flaking. The smooth-flowing paint-and-disinfectant gives an even surface and puts wholesomeness into every crack and crevice to stay there. Carbola does not spoil if left standing—may be mixed today and used any time—another advantage.

Use Carbola Instead of Whitewash and Disinfectants



to paint sunshine and health into stables, poultry houses, hog pens, cellars, kennels, rabbit hutches, creameries, outbuildings, garages, etc. Apply with brush or sprayer to wood, stone, brick, cement or other surfaces or over whitewash. A gallon (a pound of the powder) covers 200 square feet. Use it also as a lice powder, for which it also is unexcelled.

Your hardware, paint, drug, or seed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Satisfaction, or money back.

10 lbs. (10 gals.) $1.25 and postage. 20 lbs. (20 gals.) $2.50 delivered. 50 lbs. (50 gals.) $5.00 delivered.

Hitch Your Wagon to a Star

Tie Your Herd to the Proven Success of

Ravinia Ayrshires

with a Ravinia Bull and Get the Uplift of this World's Greatest Production Ayrshire Herd.

You want more milk, bigger records, better profit. It's hard to get these things.

Even with the best feed and care you can only do it by putting at the head of your herd a sire in whom great production has been bred and fixed for generations.

This is just what has been done at Willowmoor and Ravinia.

This herd has made more Advanced Registry records and more world's records than any other. You can depend upon a bull from this herd to bring you more milk, bigger records, and better profit.

In order to give one herd a definite chance to get this production uplift, we are listing in this issue

Ravinia Thrush Successor

This is a good, straight, growthy calf; more white than red; an exceptionally good individual. In this son of the second highest record living Junior two-year-old, you have tremendous milk record inheritance backed by the show quality of Beuchan Peter Pan and Old Graitney Queen 4th, grand champion cow, Panama-Pacific Exposition.

Get your order in first by wire and send check with shipping instructions by first mail.

Missouri Junior Contest

Missouri's first annual Junior Live Stock Judging Contest was held in Columbia, Missouri, on November the 12th and was a success in every way. Each Smith-Hughes School in the state was allowed one team in the contest and twenty-one of these schools

JOSEPH SMITH

were represented. About $800 was offered in prizes and a great deal of interest was manifested in the entire contest. The dairy judging contest was won by the team from Springfield. Joseph Smith of Springfield was the high individual on all dairy breeds winning the gold medal offered by the Missouri State Dairy Association.

The proficiency which these boys showed in judging live stock speaks well for the training given them by their instructors in vocational agriculture. The training in these contests is also excellent preparation for teams in future contests at the National Dairy Show. But it goes further than that. It brings these vocational schools of the state into closer touch with the agricultural college and sends them home with a bigger and a broader grasp of the real value of pure-bred live stock breeding.

Missouri. E. M. HARMON.

"Out of twenty-four hours of daily time you have to spin health, pleasure, money, content, respect, and the evolution of your immortal soul. Its right use, its most effective use, is a matter of the highest urgency and the most thrilling actuality. All depends on that."—ARNOLD BENNETT.

JERSEYS

The Profit Points of the Profit Breed

Economy: Jerseys produce more butterfat from the same amount of feed.
Early Maturity: Jerseys milk sooner.
Longevity: Jerseys milk longer.
Persistency: Jerseys have shortest "dry" period.
Quality of product: Highest in butterfat. People are glad to pay more for Jersey milk, butter and cheese.
Health and Vigor: Jerseys are easily adapted to all climates and conditions.
Prepotency: Jerseys breed true to type.
Dairy Temperament: Jerseys are willing workers.

JERSEYS—the perfect dairy cows! Write today for "Jersey facts" and "The Key to Dairy Profits"—invaluable whether you are interested in one cow or a hundred. Sent free.

Third Guernsey Field Man Appointed

Professor W. W. Fitzpatrick, for the last three years Professor of Dairying at Clemson College, South Carolina, and head of the Dairy Division in charge of teaching, experimental work, and extension work, has now become a representative on the extension service of the American Guernsey Cattle Club. Professor Fitzpatrick will work in the states south of the Ohio and Potomac rivers and east of the Mississippi. This is the

W. W. FITZPATRICK

third appointment for field service by the American Guernsey Cattle Club. Professor E. L. Westover is the western representative with headquarters in Portland, Oregon, and Professor Karl B. Musser is the eastern representative with headquarters in Rochester, New York.

Professor Fitzpatrick was born and reared on a farm. He graduated from the University of Kentucky in 1913. In 1912 he was a member of the students' dairy cattle judging team at the National Dairy Show. For eighteen months after graduation he was assistant dairy agent for the Southern Railway Company, in charge of a dairy instruction car operated over eleven southern states. From November, 1914, until July, 1917, he was in charge of dairy extension work in South Carolina, for Clemson College and the United States Department of Agriculture. During this time the first Guernseys were purchased for breeders in South Carolina. The first Guernsey bull association was formed in 1916 and in the next year the State Guernsey Breeders' Association was established. He was made Professor of Dairying in July 1917, and continued this position until his resignation on November 1, 1920.—American Guernsey Cattle Club.

Fond du Lac County (Wis.) Third Guernsey Sale

Sixty-seven registered Guernseys brought a total of $17,500 at the Fond du Lac County Guernsey breeders' third semi-annual sale on November 18 at Fond du Lac, Wis.

D. C. Shephard of Minnesota paid the top price, $725, for a 4-year-old granddaughter of George Washington of Fairfield Farm, consigned by E. V. Maltby, Illinois.

Henry Hefter, Wisconsin, purchased the highest priced bull for $385. It was a 10-month-old grandson of Imp. Kenilworth Gold, consigned by B. F. Sheridan.

Love, Benjamin, and Pohlman did the selling with Sale Manager C. L. Hill in the box.

Following is a list of all animals selling for $300 or more and buyers:

New York Butter Market

NEW YORK CITY, November 30:—The butter market has been decidedly sick for several days but appears to be convalescing as there was a firm feeling for fancy butter today. There is a marked nervousness prevailing, however, and it is difficult to predict whether or not the firmness will continue for any length of time. The principal reason for the nervous condition that prevails is the arrival of large shipments of Danish butter. It is feared that shipments from that country will continue to grow larger, now that its contract with England is filled, and that a demoralized condition of this market may result. On last week Friday, 5,084 casks, 1,292 boxes, and 6 tubs of Danish butter were unloaded. On Saturday, a further shipment of 999 casks was received, while today a boat has docked carrying about 8,000 casks of that butter. Unless some condition arises that will prevent further arrivals of Danish butter, there will be a decided slump in the market in the immediate future.

Some New Zealand butter has arrived in this market and it is of excellent quality. However, it remains unsold because of the conditions that prevail. There is a strong possibility that large shipments of that butter may be forthcoming soon, in which event this market will be over-crowded with foreign butter. There have been rumors that New Zealand butter contains preservatives other than salt. As the butter that has been received in this country passed inspection at San Francisco, it is very probable that the rumor is idle. Reports from England state that the Co-operative Wholesale Society of that country is promoting a company composed of the dairy farmers of New Zealand, the object of which is to market New Zealand butter and cheese in England through the agency of the Society, thereby saving vast sums of money in handling charges. In the event of the perfection of such an organization, very little New Zealand butter would be shipped to this country. However, the Food Control still purchases the butter used in England and until it relinquishes its control the marketing organization would be of no avail.

The butter market received a serious set-back on Friday of last week. For several days it had been weakening because of slack demand, but on Friday when over 600,000 pounds of Danish butter were unloaded it became very weak and the quotation on top grades declined 5c. On Saturday, there was a further decline of 3c. Since that day, there has been no change in quotations and the market is fairly firm on top grades but it is very weak on all other grades. Danish butter apparently has succeeded in making friends as the prejudice which formerly existed against it seems to have disappeared and it is selling readily. However, its selling price is largely responsible for that as it is of high quality and is being offered at prices of 54@56c. Argentine butter is in poor favor in the market and is not moving readily. The same is true of Canadian butter. Domestic undergrades are a drug and are accumulating in such quantities. that the matter is becoming serious. Established quotations at the close today were: Extras (92 score), 57c; higher scoring than extras (93 score or higher), 57½@58c; firsts (90-91 score), 50@56c; firsts (88-89 score), 46@49c; and seconds (83-87 score), 37@44c. W. B. LIVERANCE.

SIR ECHO SYLVIA JOHANNA
A ⅞ brother to the $106,000 bull. His six nearest dams average over 35 lbs. butter and 700 lbs. milk.

Extra fine individuals from A. R. O. dams who are daughters of a grandson of Pietertje Maid Ormsby, the dam of Sir Pietertje Ormsby Mercedes. All are good herd prospects.

Priced very low for quick sale.

Chestnut Hill Farms

Herd Under Federal Supervision

G. A. Burdick, Manager Gibsonia, Pennsylvania

Remember—

When You Buy A Bull From Hollyhock Farms

You Have Our Entire Organization Back of You. You have the benefit of our advertising and of our test force. The chances are far better than even that the dam of the bull you buy will later increase her record and the bull increase in value. Consider those things when you want a bull and write us about a son of S. P. O. M. 41st or of King Pontiac Artis Sadie Vale, the 34-lb. son of K. K. S. V. that formerly headed our herd.

We have a few good ones for sale—1 or 2 of serviceable age.

Gustave Pabst's Hollyhock Farms

Fred J. Southcott, Manager Dousman, Wisconsin

I Will Take Your Note

For Better Than a 30-lb. Bull

I will ship anywhere, express paid, for $550, 6 months time allowed or a discount for cash.

HIS SIRE is King Gerben Maid Lyons, a 33-lb. son of Rag Apple Korndyke Boon, herd sire at Friesland Farm, whose tested daughters include a number of 20-lb. 2-year-olds. "King's" dam, a 33-lb. 3-year-old with a 31-lb. daughter, is now going at a 1000-lb. clip on year test.

HIS DAM, Jessie Fobes Maud Burke, a 28.86-lb. 4-year-old granddaughter of Colantha Johanna Lad, is one of the very best producers in our herd. Her dam is by Canary Paul Fobes Homestead and is from a 27-lb. daughter of that great sire, Homestead Jr. De Kol.

Young Holstein Bulls Backed by Yearly and Seven-Day Records

Herd under Federal Supervision

We have several young bulls up to 17 months of age, sired by Maplecrest Sir De Kol, whose dam made 31.07 lbs. of butter and is a daughter of Daisy Grace De Kol, former World record Junior 4-year-old in the yearly production division.

These bulls are all well grown, and are of show type individuality. They are from dams with records up to 31.70 lbs. of butter in seven days, and 640 lbs. of milk.

Included in the above are a few young calves from 2 to 4 months of age from untested dams, which I will price very reasonable for immediate acceptance.

Prices and full description, with photographs will be furnished upon application.

These calves should be seen to be appreciated.

C. A. WILSON, Prop., Decatur, Illinois

FOR SALE

20 to 25 head of Registered Holstein cows from 4 to 8 years old, mostly close up springers, in calf to Sir Rag Apple Korndyke Hengerveld, a 39.283-lb. grandson of Pontiac Korndyke (whose two-year-old heifers are making mighty good records). Several of these cows have good A. R. O. records. We are selling to make room for our heifers that we expect to test this winter.

Patterson & Dickinson, R. R. 6, Bellefontaine, Ohio

A Few Splendid Young Bulls

for sale that have show ring type, that are backed by 7-day and yearly records and by the best productive breeding in Ohio. They are from an accredited herd, are guaranteed right and are priced to sell.

Zehringhurst Farm, Germantown, O. Oscar O. Zehring, Prop.

25 Holstein Cows For Sale

exchange. 23 are high grades, 2 are registered. Also my herd bull, a grandson of K. S. P. A., the $50,000 l. This bull is from a 27-lb. cow. Most of the cows are bred to him. All are young cows, well marked, vy producers. Price, $200 per head if entire herd is purchased.

'll take 2 good teams of draft mares or mules as part payment or might consider a good used auto-bile as partial payment.

G. A. HIGGINBOTHAM, Rossville, Kas.

Will County Holstein Breeders' Sale

New Lenox, Ill., December 14

Commencing at 11 a. m.

70 HEAD *of A. R. O. Cows and Sons and Daughters of A. R. O. Cows*

A few of the offerings are:

A heifer, whose dam, Lady Beets De Kol Twist (164967), made 31.31 lbs. in 7 days and 122.446 lbs. in 30 days and whose sire, Pabst Champion Abner, heads the herd of Fred Knudson, also a daughter of Sir Tehee Cornucopia (sire of 31 A. R. O. daughters and 7 sons).

Two sons of Sir Johanna Delia (192528), who heads the herd of Frank Sprague & Son.

The Phelps consignment is headed by Wakefield King Hendrikjen (193464), a 24-lb. grandson of King Segis Pontiac (150 A. R. O. daughters, 79 proven sons).

Wilbur A. Francis is consigning a daughter of a 28-lb. cow, also a daughter whose 7 nearest dams average 26.11 lbs. Herd sire on Francis Farm, Sir Susie Dale Segis (157609), a son of the noted Johanna McKinley Segis, out of Johanna De Kol Van Beers.

Sale will be held at the Wilbur A. Francis farm, near Joliet and New Lenox. Free transportation to the farm.

The Rock Island and Santa Fe and Alton Railroads pass through Joliet.

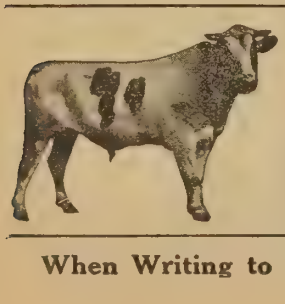
A Son of King Bess

from an A. R. O. granddaughter of Colantha Johanna Champion will suit you for a herd sire



Here's one from Johanna Rutena 3d, a 23-lb. junior 3-year-old that is one of the best long time prospects we have. Her dam, a daughter of Champion, has 30.37 lbs. as a 4-year-old and is now going at better than a 1,000-lb. rate on year test.

King Bess is from a 33-lb., 1,235-lb. daughter of S. P. O. M., so that in the 5 generation pedigree of this calf, every dam has over 22 lbs., 10 have over 30 lbs. in 7 days, 7 have year records, 4 above 1,200 lbs. and 5 over 1,000 lbs.

The calf is a dandy, straight, four-fifths white and well grown. He was born March 8.

Write or wire today about him.

2 Of My Sons Are For Sale

RAG APPLE PONTIAC

They are full brothers, one 18 months old, the other 8 months old. Both are first class individuals, nicely marked and very well grown.

Their dam is one of the best producers in the herd and has a 7-day record of 26.96 lbs. butter.

I am Rag Apple Pontiac. My dam is a 30-lb. daughter of King of the Pontiacs and I trace several times to Pontiac Korndyke.

There are a few other high class sons of mine for sale here.

Several A. R. O. Cows

and some good heifers are for sale. The cows' records run up to 72 lbs. My boss is offering these females and young bulls at bargain prices because he needs the room. Better write him today. He is

W. W. Quackenbush - West Salem, Wis.

HOLSTEIN BULLS AND HEIFERS!!

To make room in our barn we offer a dozen or more heifers from 1 month to 3 years of age. They are backed by some of the best families of the breed. Also a few bulls sired by King Korndyke Veeman, whose two nearest dams average age over 37 lbs. butter in 7 days. Come and see them or write to

WISCONSIN STAR STOCK FARM, ED. M. SHULTZ, HARTFORD, WIS.

Bull for Sale

Having been authorized to sell this bull at a very nominal price, I will give you a brief outline of his breeding.

SIRE—Sir Ormsby Banostine Champion. "The only son of Duchess Skylark Ormsby, the only 1,500-lb. cow." This is enough regarding the sire's breeding.

DAM—A 34-lb. cow with two A. R. O. daughters, and she out of a 29-lb. dam and she out of an A. R. O. cow.

This cow and her dam are individuals, and the dam of the bull is a sister to one of the present day sensational sires in regard to individuality and production of his offspring. Every cow in pedigree is an A. R. O. animal.

This wonderful son of this large producer is offered only for the fact that the herd is small and he is a bull that needs an opportunity.

Guaranteed for 60 days and right in every way. No abortion or T. B. in herd. He is dark, three years old, and weighs 2,400 pounds. Will sell outright or trade for stock of equal breeding.

We offer bull calves by Sir Paul Veeman Hengerveld and Sir Ormsby Skylark Fredericka, out of yearly record dams with type.

Edinboro, Pa.

King Oak Segis Pontiac

Our Herd Sire

A Herd Cannot be Better Than Its Sire

You can put green goggles on a cow and feed her sawdust. It's cheaper, of course, but will the cow give milk?

It's the same way with a herd sire. A poor one will probably sire just as many cattle, but what will they amount too?

If you intend to get anywhere raising Holsteins, you must use the best sire that money can buy.

We had this in mind when we bought King Oak Segis Pontiac and his full brother, Oak Dale Segis Pontiac. But there was one other reason why we bought these two great bulls. They carried the blood lines we wanted.

There are five strains of Holsteins that look pretty good to us and quite a number of our fellow breeders. They are so good in fact that we have decided to affect a combination of all of them.

Our foundation dams were selected with this in mind and now with the help of our wonderful Herd Sire, King Oak Segis Pontiac, assisted by his full brother, Oak Dale Segis Pontiac, we are well under way with our great work.

We have a few foundation cows and young sires for sale which might interest you. Write us or, better still, come and see our herd and let us tell you more about the great work we are doing.

You Build But Once—Be Sure You Plan It Right

THE JAMES WAY

9 trusses for 100-ft. barn like this requires 706 board feet. At $60 per M—$381.24.

Which is the better way?

TYPICAL TIMBER FRAME CONSTRUCTION

9 trusses like this requires 1266 board feet at $80 per M—$911.52. A difference of $530.29.

Mistakes on paper are easily rectified and buildings on paper are readily moved. Once built, changes can be made only at great expense.

It pays to plan a remodeling job or a new dairy barn, *on paper, before* the foundation is dug, *before* the carpenters come, *before* actual work is begun.

The dairy barn is your factory, your workshop, in use almost daily throughout the year.

If it is not built right, if it is not correctly planned, it may lose you money every day.

Wrong location of posts; inconvenient arrangement of feed bins and feed rooms, incorrect arrangement of carrier tracking or stalls or pens, or the wrong designing of the hay loft, may compel you to take more steps, do more work and pay out more money for help each day during the life of the barn.

Save Work Daily — Save Building Costs

A chain is no stronger than its weakest link. A timber is no stronger than its tenon.

A silo or a door in the wrong place, poor arrangement of equipment, ventilating intakes or outtakes improperly installed, mistakes in size in stall floors, gutters, passages and alleys—even these smaller errors may be a source of daily expense and annoyance.

A barn correctly designed and built right in every detail is a constant money maker because it is a constant money saver.

If rightly planned, cow comfort and cow cleanliness may be assured; plenty of light, abundant ventilation and easy disposal of litter will be provided; floor space will be used to best advantage; and all the chores made easy. In many a case, careful planning has cut barn work squarely in half.

What a barn will cost depends in no small degree on the care with which it is planned in advance.

It is no uncommon thing to see a man with the "Know how" build a barn at 20% to 30% less cost than another, although the barn accommodates the same number of cows.

And the man with the "Know how" gets a handsomer building, more convenient and better.

How to Get the Low Bid

Regardless of who designs the barn it is well to submit the final plans to several contractors, getting bids from each.

By having as many sets of blue prints and specifications as there are contractors figuring on the barn, you can safely let the contract to the lowest bidder.

You get the low price, and the successful bidder binds himself to give you the same workmanship, construction and materials as those who bid higher. You hold him to the blue prints and specifications.

National Clearing House of the Best Barn Ideas

To help our customers and others get the best barns possible, we, years ago, established the Jamesway Barn Plan Service under direct supervision of Mr. W. D. James, known as the leading dairy barn authority in the U. S.

Associated with him in this department is an architect and engineer of unusual experience in ventilation, reinforced concrete, steel work and structural design.

Another architect with many years of experience in planning, building and remodelling of dairy barns, a large force of skilled barn designers and draftsmen, and barn experts in charge of divisions of the field force, complete the office staff.

In the field, are more than sixty men who practically every day are consulted by farmers on remodeling and other barn problems, drawing preliminary plans and reporting new ideas and unusual conditions.

For years, Mr. James and these associates, have studied dairy barns—how to best remodel; construction, lighting, ventilation, drainage; how barns should be arranged for labor-saving. Every year they plan or help to plan thousands of dairy barns.

The experience and help of these men is yours for the asking. No charge is made excepting when complete plans and specifications are ordered.

Barn Book Free

Much of their experience and the best of their ideas are contained in a 320-page book which will be sent postpaid on request.

In addition to 28 pages of blue prints, 62 pages of pictures of barns in all sections of the country and many pages on barn planning, ventilation, remodeling, etc., this book tells all about James inventions that save so much of labor, prevent spread of disease, promote better cow health, make simpler the care of calves and sick cows, protect against dangerous bulls, and increase milk yields.

Write us now. Tell us what barn problems are bothering you; perhaps we can help solve them.

If you want the book, ask for Jamesway Book No. 23.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

November Condensery Prices

Prices paid producers for 3.5% milk delivered at factories during November are based on reports made to the U. S. Bureau of Markets by condensed and evaporated milk firms operating approximately 46% of the total factories in the United States. This is a smaller percentage than usual as 54 firms reported no price determined, 21 were temporarily closed, 16 were handling milk for patrons' account, and 2 were out of business. For the firms reporting the prices paid for 100 lbs. of 3.5% milk were as follows for the past three months:

Geographic section	Sept.	Oct.	November Case and bulk goods	November Bulk goods only
New England	$3.89	$3.96	$2.92	$3.91
Middle Atlnatic	3.64	3.49	3.70	3.41
South Atlantic	3.20	3.06	3.30	2.74
E. North Central	3.14	2.70	2.43	2.97
W. North Central	2.69	2.70	2.47	2.87
Western (North)	2.84	2.55	2.03	2.99
Western (South)	2.83	2.56	2.43	3.27
United States	3.31	2.88	2.61	3.17

Wholesale Prices of Condensed and Evaporated Milk

This little pig went to market,
A nice, fat project pig;
His seven brothers stayed at home,
Same age, not half as big.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Two Cows

Bess was a lovable sort of a cow,
Nice to be with and nice to know.
Raised—well, I cannot tell when or how,
That is the way that some cows go.
But when it comes to the ledger's toll,
Records were brief and her output small,
Never ran true to a handsome goal,
Just gave her milk and that was all.

Queen was a sleek and a well-bred girl,
Bright was her eye and her manners pert.
Went to her feed with a swish and swirl,
Just a bit proud and her conduct curt.
But, as to milk and the grade of cream!
Ah! Now I'm telling a different tale.
Pedigree told, it's no idle dream!
Those who have blood, well, they never fail!

That's how it is all the way through life,
Whether with cows or with human kind,
Pedigree tells in the storm and strife,
Class in the breed and the health—and the mind.
Rather one cow with a clean blood strain,
Rather one child that is great of birth,
Than all of the stock that the thoughtless train,
Here on this troublesome, workaday earth.

Some folks are too tarnal good to remain on earth, but I would not go so far as to say that this applies to dairy farmers who love and are kind to the herd and who believe in putting machinery under a shed when it rains.

The New Version

Sing a song of bottles,
On the back step, there,
Of the city dwelling,
That's his honest heir.
Mr. City Feller,
And his jug of cream,
And his quart of glory
From some dairy stream.

Far from cows and pastures,
Far from clover sweet,
Far from barns and silos,
And a pot-cheese treat.
It's his way of knowing,
What a herd can do.
It's his way of tasting
All the relish, too.

Ah, at five, each morning,
Hear the milkman come.
With his rattle, clatter,
And it's going some.
But for mine, the jingle
Of the cow-bells, sweet,
And the smell of clover
Growing at my feet.

Human Nature Always

The dairyman asks: "Have the cows pedigree?"

The farm manager asks: "Have we competent help?"

The helper asks: "How much do I get a month?"

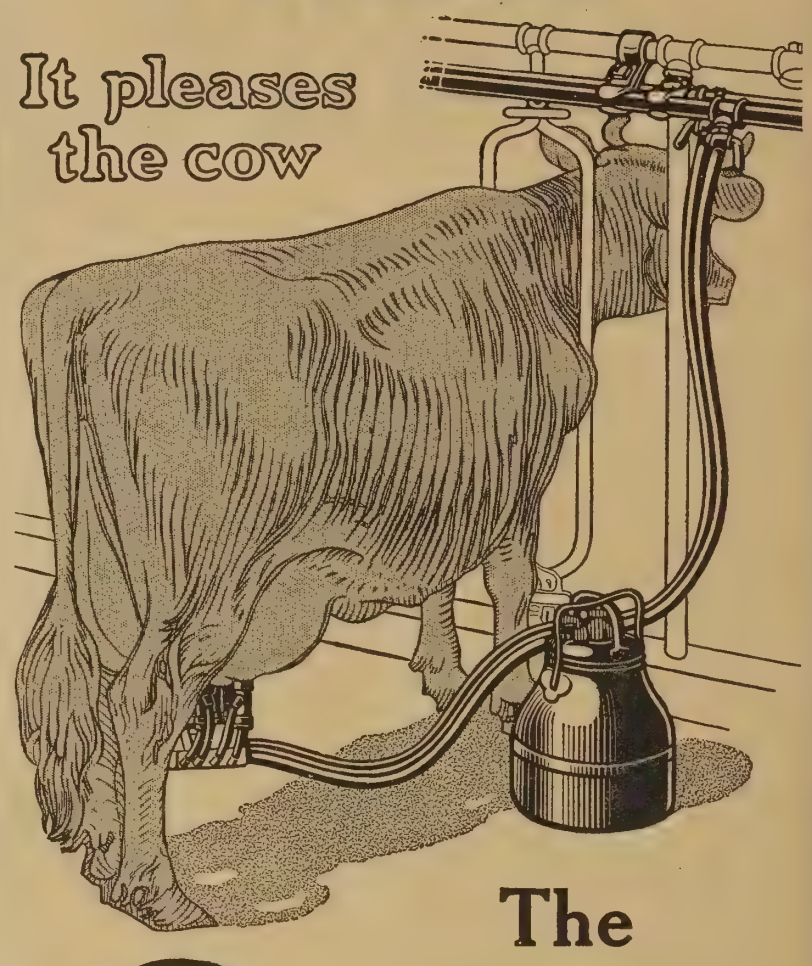
The wife asks: "Can I have a new piano?"

The daughter asks: "Can we have a new car to take us to the movies pa?"

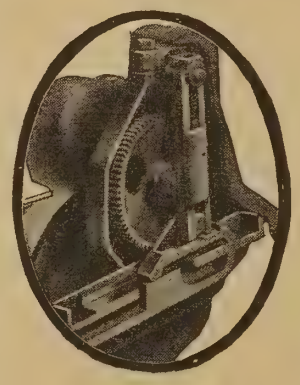
The son asks: "Do I get a herd of my own, dad?"

And the herd asks: "Do I get the right rations and the right care in the right barn?"

All of these questions are easily answered.



Dairy Jim's Philosophy



Once farmers thought more about lightning rods than anything else. Now they would rather have a cream separator and pedigreed stock. Superstition is a dead issue and the lightning rod agent has joined the great majority.

And still, and yet, lightning has its way of striking. While building that new silo, it's just as well to remember that standing under a tree in an electric storm is mighty bad business.

Some dairy farmers think so much about county fair prizes and blue ribbons, that they forget there's a market waiting for milk.

The De Laval Milker

The Master Control

(The Master Control is not shown in the part of the Milker installation pictured above. It is built into the Pulso-Pump, which is placed in any convenient part of the barn)

The Master control part of the De Laval Pulso-Pump is a fixed, gear-driven slide valve, furnishing the impulse to every Udder Pulsator in the barn in a positive mechanical way, so that all milking units in the barn work in unison all the time. The pulsations produced by the Master Control are transmitted through the small, independent pipe to all Udder Pulsators.

These pulsations are scientifically correct in duration and frequency, and the pulsation speed cannot be changed by the operator. Improper and unnecessary adjustments are therefore impossible.

The De Laval Milker is a distinctly different type of machine, both as to design and operation, positive and uniform in action from day to day; and faster, more economical and more reliable than any other method of milking. The sanitary features are of special importance and will be much appreciated by dairymen in their efforts to produce milk having the highest market value. An additional insurance of lasting satisfaction to users of De Laval Milkers lies in the De Laval Company's well-known facilities and reputation for service.

MUST PIGS ROOT? EVVARD SAYS NO

WM. E. DRIPS, IOWA COLLEGE OF AGRICULTURE

"LOVE of money is the root of all evil", even in the case of the hog. He must root because his master won't spend the money to get him some protein for his ration, and in his anxiety to get the protein he fails to get that essential quality of all hogs, weight.

Here's the solution, according to John M. Evvard, swine feeding expert with the Iowa Experiment Station, given out at the annual Swine Feeders' Day on Armistice Day at Ames: "Give the hog some tankage or buttermilk or some other high protein feed along with the corn and he will not care what is under the sod but will rest quietly in the lot while the feed is being converted into fat on his body."

But this wasn't all Mr. Evvard told at his meeting. He had numerous pens of pigs, getting various kinds of commercial feeds, several pens of pure-bred pigs which were being tested as to their type, some pigs sired by a wild boar, the original sire of the swinedom. These and many other features kept together the crowd of three hundred farmers, breeders, county agents, and farm journal correspondents, following the jovial Mr. Evvard around the station despite the wintry weather that prevailed.

In the matter of rooting it is simple and here is the test he put the pigs to. One lot of pigs was given a free choice ration of corn, salt, and blue grass pasture while another lot resembling the first in weight and general characteristics at the start of the test were given corn, salt, and blue grass pasture plus tankage fed the free choice method.

At the end of 90 days the lot which received only the corn and pasture weighed 109 lbs. They made a daily gain of .67 lbs., ate a daily ration of 2.8 lbs., and required 419 lbs. of feed to produce 100 lbs. of weight. They were wild and restless and turned up the lot from one end to the other and were still at it the day I saw them.

The lot receiving the tankage along with the rest of the ration weighed 171 lbs. They had made a daily gain of 1.38 lbs., consumed 4.8 lbs. of feed daily, and required only 347 lbs. to produce 100 lbs. of weight. They were tame, contented, and had not turned up any of their lot. They were twice as good gainers as their fellow workers in the adjoining lot.

"When a hog or pig roots, look to Evvard as a great believer in tankage; it is expensive but the difference in the gain during the period of the test made it worth our while."

There are many kinds of tankage. The kind Mr. Evvard likes is the better grade, that which tests 60 per cent protein, and his tests show that it certainly pays to give the pigs the best. The cheaper grades contain too much fiber and material which is to be had at a cheaper price from other sources. Perhaps many farmers are wondering over the question of where to get the tankage, as did several in attendance who raised the question. They wanted to know if it was safe to buy tankage from any rendering plant, especially the ones close to home. Mr. Evvard was quick in warning them of the disease which could be put in a herd by feeding tankage that had not been properly sterilized. A little more care and perhaps a little more cost will repay the average feeder in the long run.

Another feature of the day was when the wild boar was trotted out before the spectators. This animal, from which all modern breeds have sprung, raced into the pen. He is a shaggy individual, carrying most of his weight on his fore quarters, has a long nose, large tusks, poor legs, a peaked back, and slanting hind quarters. Although he is several years of age he weighs about 150 lbs. As a curiosity he is a first class attraction but as a type of a hog he is a failure.

Next door in another pen the visitors were asked to look at the result of crossing this animal with a pure-bred Poland-China sow. Here were five pigs, small and shy. They had all their father's features and none of their mother's. The slightest trace of the Poland-China breeding was absent, all in one cross.

These pigs, although six months old, weighed less than a hundred pounds, had been poor gainers although they had been fed a good ration. They received, by the self-feeding method, corn, tankage, corn germ meal, alfalfa meal, and salt, a ration which with our modern hogs would have made a gain of 175 to 200 lbs. in the same time. The best record these pigs ever made was one-half pound a day and that was only for a short time. The lesson here was how quickly the modern hog which had been brought to his present standard through many generations of breeding can be turned back to the original state by a few mistakes. Farmers must keep their breeding stock up if they intend to have good hogs to feed. One poor boar which carries the traits of his wild ancestor will impart sloping backs and long noses to his offspring in a very short time. It takes a long time to breed them up but they go back rapidly.

Another interesting test carried on at the station was with the different types of hogs within a pure-bred line. Pigs representing all three types, large, medium, and small, were shown. All pigs were farrowed in April, all had the same rations and same surroundings and the results were interesting.

Lot one, which contained the pigs from the small type, were not extra good in general appearance. They had snuffles and were light in weight. Mr. Evvard said they had been causing a lot of trouble, due to their susceptibility in getting all the ailments going. They looked despondent.

Lot two, containing the pigs from the medium type, were in good shape, weighing around 200 lbs., were thrifty and fine looking market pigs. They had done well and made a good showing up to date but again Mr. Evvard said they had reached their limit when it came to speed in growth.

Lot three were good healthy pigs not so heavy as lot two, but they had made the best daily gain during the latter period of the test. They had been putting in their time getting legs, bones, and frame to support what was to come. They also were in good spirit and showed up well. It was between these two lots that the ideal pig came. All had a good growing ration used by the station for pigs on dry lot feed. While only a beginning, this test will be continued for other years and the results noted.

It certainly is an interesting sight to see the rows of yellow hog houses stretched out on the flat. Each house has five roomers and each group has its own pasture. Water is provided by a pipe line and all hogs are watered twice daily. In the winter they get cold water for Mr. Evvard says warm water for hogs is not necessary and if the feeder wants to get a good record he wants to get the feed inside where the pigs do not have to go out in the cold wind to eat. Being an advocate of self-feeders, all pigs were

(Continued on page 956)

ROOT HOGS! OR DIE?

"There is an old, old saying that the love of money is the root of all evil. Here is a rooting scene that would not have been presented if a little money had been invested in proper supplemental feeds, feeds such as alfalfa, clover, skimmilk, meat meal tankage, mineral mixtures, and such like. Do you see the "rooters" above? There are no "rooters" below. Why? The unhappy pigs of rooting fame weighed a little over 100 pounds when about 5½ months wise, whereas the pigs of the lower pastoral scene weighed around 175 pounds—all the same kind and quality of pigs, litter mates, pen mates, that grew up together until that fateful day three months before this picture was snapped when the "would be rooters" had the meat meal tankage left out of their ration of self-fed corn and salt on bluegrass pasture. The "bouncers", fat and saucy, below, got their nips of tankage daily, free-choice style, and gained twice as much per day as their ill-conditioned, ill-disposed brothers and sisters. When pigs root, look to their feed, as more and better feed may stop them. Tankage stopped the rooting in this experiment; and say, the tractor that pulls three bottoms hasn't anything on these Ames "Bluegrass Rooters" when it comes to depth. All you could see of some of these rooting pigs this summer was their rumps."—JOHN M. EVVARD.

THE MUTT AND JEFF OF SWINEDOM

Mutt's lot fell to bluegrass, corn grain self-fed, and salt self-fed. Mutt is a spotted pig and is thankful for his feed, but wishes he was given more. Jeff's lot fell to the same bluegrass, same corn grain, same salt, but part of a bag of tankage was thrown in for good luck. If you'll compare Mutt and Jeff you'll see that tankage is better than horseshoe luck. They are of about the same age, 5½ months, and had they been fed the same they'd have now looked about equally well, excepting, of course, the difference in spots. Mutt and his fellows average 109 pounds, Jeff and his fellows 171 pounds, or 62 pounds more. Mutt is discontented—Jeff is happy. Mutt is a rooter—Jeff is not. Mutt is a racer and built for speed—Jeff is not, and doesn't care to. Jeff is looking for something and always lands in trouble—Mutt has what he wants and appreciates his meat meal tankage because its balancing proteins, minerals, and vitamines have put pep into his domestic frame. Lest we forget to point the moral: There are countless extremes, Mutts and Jeffs, on our American farms, some recognized, most unrecognized, as such."—JOHN M. EVVARD.

THE KIND OF TANKAGE FED

"The pig on the left received in addition to his self-fed shelled corn and salt ration, a good grade of 60% protein tankage, but his mate on the right received a lower grade of tankage that happened to carry about two-thirds as much protein. This does not mean that 40 or 50% tankages are not good; they are if made right. But it does mean that one had best buy well-made tankage, the sort that does not carry too much fibrous or other undesirable material."—JOHN M. EVVARD.

DID YOU SAY SQUIRRELS?

"Shall we breed them up or down? No! These are not squirrels, but real pigs. They are the result of the cross of the Wild Boar on a Poland-China sow. These three pigs might have been pretty good Poland-Chinas had we used a Poland boar, but we didn't. We wanted to see how fast and how far back, speaking in parables, we could fly in one generation, this by making a wild boar top cross. They, like their daddy, are built for speed and endurance, and need a "rat proof fence". They are light weights, not a one of them, after six months of Iowa farm life, can boast of a hundred pounds avoirdupois. And yet they have been self-fed, free-choice style, on corn, tankage, corn germ meal, alfalfa meal, and salt from farrow. They should be twice as heavy as they now are. But they won't gain; they are too busy thinking about the fine time they'd have if they were roaming the wild woods. How easy it is to turn down our blood lines, to injure our foundation stock. In the spermatozoa (the male generative units) of scrub boars their lies much of retrogression and objectionable reversion. Grading up a swine herd is likely to be slow and somewhat difficult business, but certainly worth the effort. One can move backward much more rapidly and easily than forward, hence when we reach a high plane of effectiveness we must be careful to diligently and persistently 'watch our step lest we slip and harbor regrets."—JOHN M. EVVARD.

AYRSHIRES ON THEIR NATIVE HEATH

THOMAS FORSYTHE HUNT, Dean of Agriculture, University of California

ASIDE from grass, the prominent crops of Southwestern Scotland are oats, potatoes, and turnips (Swedes). Comparatively little wheat and barley is grown. Less than one acre in five is counted arable. One acre in three of the arable land is in oats. The next largest crop is turnips which comprises an area about one-third that of oats.

Ayrshire is noteworthy because it is one of the few places where timothy is raised as a pure crop—to use a British expression. Timothy hay is well liked. Mr. Cochran, manager of the West of Scotland Agricultural College Farm, said that while a mixture of clover and rye grass, which is the common rotation grass, when well cured might make a better food, in their climate it was likely to be damaged and hence was generally less desirable. The perennial habit of timothy is highly prized. My informant said that he had known timothy meadows to last for twenty years. It is perhaps not altogether without significance as to soil conditions that one of the arguments made for attempting to breed the horns off Blackface sheep is, that the horns exhaust the soil of phosphoric acid.

While there is a considerable trade in seed potatoes about Dumfries for shipping south into England, the potatoes are generally the early varieties planted in February and lifted in June and July at a time which gives them a favorable market. This special potato area lies in a narrow strip near the seashore north and south of Ayr. The potatoes are auctioned off in the field. The successful bidder must dig them and turn the cleared land over to the farmer by a given date. The land is then plowed and immediately put into a second crop. This may be a grain crop, as barley, but I am told it is more frequently rape which is fed off with sheep. The rape crop is highly prized by the sheep raiser, but I was informed in Eastern Scotland that farmers were finding, in some cases, the rape crop more valuable to plow down as a cover crop than as feed for sheep. I found no difficulty in getting that statement disputed, but the fact that it was put forward by responsible parties is a matter of interest. Years ago, Patterson of the Maryland Station reported that there was reason to believe the rape plant, being a gross feeder, would make phosphorus available for other crops.

The country south of Glasgow, until one comes within five miles of Kilmarnock, is rather unprepossessing, as is apt to be the case in coal regions. For a distance of ten or fifteen miles immediately adjacent to the second largest city in Great Britain, there is practically not a plowed field in sight. Many Ayrshires were seen. The large preponderance of young stock in this area attracted my attention. As we proceeded southward we came into a "bonnie" country. Pastures and meadows interspersed with ripening fields of oats (September 16), tasteful farm steadings and milking herds of Ayrshires, as well as evidences of "Bobbie" Burns were to be seen on every hand. Nowhere during our travels of a thousand miles did we see so many cattle to the square mile. They may have been in other regions but they were not in view.

The farms are fairly good size. Three hundred acres are deemed to make a tidy farm. A larger farm may contain 600 acres of arable and in addition some hill or mountain land, perhaps 2,000 acres in all. I saw eight farms lying side by side each containing 500 acres and renting for from $2,400 to $2,800.

It is somewhat difficult to determine how much lands rent for per acre, since the farmers are not in the habit of thinking in acres but in the amount of live stock the farm will carry. This is as it should be. The sizes of a farm should not be determined by its acreage but by its income. In Scotland, the farmer's income tax is computed on twice the rent he pays for his farm. If he is not satisfied, he may declare his income. Thus far he has been content to allow his income to be computed on twice his rental, but he is looking forward to the time when it will be expedient to show his books. Hence there is a brisk demand among farmers for instruction in bookkeeping.

The farm at Kilmarnock, on which the Dairy School for Scotland is located, contains 200 acres while another 80 acres has just been taken over. There was some interesting work being done at the Dairy School in the manufacture of Cheddar, Cheshire, and Stilton cheese. The processes of manufacturing these different kinds of cheese were going on side by side, which increased the value of the instruction. The students were, also, taught to make butter from whole milk. I was told that this practice is quite in vogue in Scotland. It is especially profitable where there is a good demand for buttermilk. It is evidently good buttermilk, since it contains 0.6 to 0.7 per cent of fat. However, there is comparatively little butter produced in Southwestern Scotland. Thus in Dumfriesshire, Mr. John Gillies, in charge of the county (extension) department for the West of Scotland Agricultural College, has 130 farms on which cheese is made. There are rather more which produce milk for consumption. There is comparatively little butter produced except when the demand for milk is slack and even then it is more likely to be made into cheese under existing control conditions.

I visited a number of dairy farms with Mr. Gillies, coming upon them unexpectedly since telephones are uncommon. Everywhere I was struck with the cleanliness of the "byres" (cow barns) and surroundings. Of the number of herds of Ayrshire cattle that I had the privilege of seeing somewhat intimately, the herd of Mr. James Howie and Mr. David Hodge stand out as worthy of special comment. Mr. Howie is one of the leading exporters and is well known to American breeders of Ayrshire cattle. His herd of thirty odd milking cows I think is the best herd of Ayrshires I have ever seen. Most if not all of the cows had records of 10,000 up to 17,000 lbs. Mr. Howie has colors to suit the American trade and other colors to suit the South African taste, but he himself says quite frankly that this insistence upon color is a silly fad. However, he admitted that you could not do anything to a brown cow, but that by washing her, you could greatly improve a white cow for the show ring.

The most striking thing about these cows was their udders (always called vessels by Scotchmen). They had uniformly good udders, but very few of them had the real typical, flat, tight udder that we have been taught to associate with the Ayrshire.

The stock bull belonging to the dairy school is from a cow in this herd with a record of 17,000 lbs. of milk in one year. A sister of the cow, also in the herd, has made 10,000 lbs. with her first calf. This picture was not taken because of the bull's beauty or fine points. It seemed to me that his great vigor and sturdiness, which some may call coarseness, coming as it does from one of Mr. Howie's best cows, is rather significant of the breed. Mr. Hodge has what is called a commercial herd of 70 milking Ayrshires worthy of his own breeding and turns the milk into Cheddar cheese at the farm. While the emphasis is placed upon cheese production, nevertheless Mr. Hodge won the sweepstakes for the best female Ayrshire of any age at the Highland Show.

An interesting breeding experiment is going on at the Dumfries Asylum where a herd of 90 milking cows with an Ayrshire foundation is maintained. These cows are being bred to a Red Polled bull in the hope of getting as good a dairy cow as the Ayrshire, minus the horns. The offspring is generally red and polled. It is said that occasionally a useful animal is obtained but too frequently the offspring is indifferent. Ayrshire men, however, say that a polled Ayrshire cow is greatly to be desired. I wonder if it is really so.

This institution introduced the milking machine fifteen years ago. I saw the first pulsator installed here chugging along on a cow as contentedly and apparently as efficiently as if it had been invented yesterday. I am convinced that the Britisher is far better than the American at keeping machinery in repair.

There is, perhaps, more activity in the buying and selling of land in this vicinity than elsewhere, although the upheavel is more or less general throughout Great Britain. Many of the estates are being offered for sale and the tenant farmers are rather reluctantly buying their places to keep some tenant's son from buying and thus ousting them. The statement was made that the farmers generally would prefer to rent but had to buy in self defense. Upon inquiry as to whether it was not desirable for the farmers to own their farms, the answer was in the affirmative provided the farms were not purchased at inflated prices. The tenant farmer generally feels that while prices may not go back to the pre-war level, present prosperity cannot be expected to continue. Hence, rental is a safer policy, and he buys only when compelled to do so.

Pig Weighs 308 Pounds at 208 Days of Age

An unusual incident of rapid growth and fattening of a pig is reported by the Ohio Experiment Station.

One pig used in experimental work weighed 3.7 pounds at birth; at the time the test was completed the pig was 6 months and 24 days of age and weighed 308 pounds, making an average daily gain of 1.46 pounds.

At the weight of 87 pounds the pig was started on a 105-day feeding test in which it gained 2.1 pounds daily.

Besides rape pasture, the feed consisted of corn 14 parts and tankage 1 part, by weight, when the test was begun; when the pig reached a weight of 125 pounds a ration of corn 19 parts, tankage 1 part, was fed.—Weekly Press Bulletin, Ohio Experiment Station.

A Tennessee Creamery

F. C. McCUSKEY, TENNESSEE

ABOUT fifteen years ago it became evident to some of the people of Franklin County, Tennessee, that they needed something to bring in more money for the farmers of this county. They tried to raise melons and other truck crops and sell through the commission men in the cities. After trying this they came to the conclusion they were dealing with a slippery bunch as all their crops did not bring back the money they had hoped to get for it. Perhaps part of the trouble was in the way the crop was prepared for market, we do not know. Anyway they had to find something that would do better than they were doing with truck farming.

About this time there came into this country a Catholic priest, Father Duffey. He was from Wisconsin where the dairy business has been developed to a great extent and in looking around for something to help his people he suggested starting a creamery. About this time a young man of this county came back from the Agricultural College at Knoxville. This man, Mr. Arthur Ring, joined forces with Father Duffey and they worked out a plan to get the money for the creamery.

After figuring out the cost they found it would take about $1,600.00 to put up a creamery in Winchester. The banks offered to loan the money if about thirty farmers would give their individual notes for $60.00 apiece to cover this loan. So thirty progressive farmers put up their notes and Mr. Ring was sent up into Ohio to buy a second hand plant from an old creamery that had gone broke. In the meantime Mr. H. M. Templeton donated a lot for the use of the creamery as long as they continued to use it for that purpose.

On April 1, 1910, the new creamery opened for business. They only had about 250 cows to start with. Mr. Arthur Ring was the buttermaker. He churned every other day, and on the day he was not churning he took a spring wagon and a pair of ponies and went around gathering up the cream for the next day's churning.

From the very beginning 1% of the receipts were set aside to pay off the note the farmers had put in the bank to make possible the starting of the creamery. While the production of butter the first year was only about 12,000 pounds, the growth of the creamery has been slow and sure.

THE ORIGINAL CREAMERY BUILT BY FATHER DUFFEY

THE NEW PLANT BUILT FROM PROFITS MADE

At the regular meeting of the stock holders of the creamery in January, 1913, Mr. Frank Pittenger was elected secretary of the creamery. Under his management the creamery has grown until in 1919 they built a new creamery at a cost of $4,500.00. Some of the money for this new creamery was on hand when the new building was started as a few years ago they increased the sinking fund each month from about $25.00 to $100.00 a month. Part of the money for the new creamery was made by Mr. Pittenger by holding a carload of his summer butter until in the fall when the price of butter went up. He made $1,200.00 on this carload. As the patrons of the creamery had been paid the current price for the butter in the month it was produced this money all went to the creamery and was enough to put them out of debt.

The creamery buys feed and fertilizer for the farmers. And as they have been in need of some place to store these things when they bought they have just completed a warehouse at a cost of $1,500.00. Acid phosphate (16%) is being sold this year to the farmers at $32.00 a ton. This is as cheap as it is being bought anywhere in Tennessee this year. The new warehouse will be paid for before this year is out. During the summer months the creamery is handling about $2,000 worth of feed a month. This is at a great saving to the farmers. While the feed is handled for the benefit of the 665 patrons of the creamery anyone can buy feed there.

This summer some sugar has been sold to the farmers for canning purposes. This has meant more saving on the high price of sugar.

Since the creamery began to sell Golden Rod butter in 1910 there has been a great increase in the price paid for a pound of butterfat. While the year 1911 only averaged 27 cents, the year 1919 averaged 65½ cents a pound for fat. Since the creamery has been in operation it has produced 1,583,360 pounds of butter valued at $854,142.25.

Below is a statement showing the amount of butter produced and its value for every year since 1911. This shows the growth and the money the creamery is bringing into Franklin County every year.

	Lbs. of butter made	Ave. price paid cents	Total business
1911	41,387	27	$ 12,416.27
1912	68,447	27½	20,534.14
1913	92,426	29	28,652.02
1914	154,036	31½	53,912.81
1915	202,758	30	75,199.37
1916	275,115	35½	100,537.89
1917	296,659	47	144,553.27
1918	323,469	59	184,471.98
1919	383,099	65½	233,864.44
Total	1,583,360		$854,142.25

Dairying at Arizona State Fair

H. A. HOPPER, NEW YORK

WHILE Arizona is a great mining state, its wealth and activities are by no means limited to this field. Like every western state, she hungers and thirsts for increased population. So great has been her success in attracting citizens to this land of promise, that the recent census report gives a gain of 63.1 per cent, the largest increase shown by any state.

A statement indicating the source of state taxes also indicates the relative importance of the industries of the state. In 1920 mining paid 52.7 per cent of the taxes, land improvements 11.6 per cent, railroads 11.35 per cent, city or town property 10.44 per cent, and live stock 4.7 per cent. Bearing in mind that live stock is largely a range proposition in the state, the dairy cattle interests become a small part indeed of that 4.7 per cent.

In a human sense, however, dairy development is very important. Milk and butter substitutes are painfully evident but the real article is in growing demand. The increase in population must be fed. Many come to rest, others are sick, but all need, in addition to the climate, the vitalizing effect of good milk. The state has apparently set its hand to the task of supplying this need from its own resources. They are beginning to say, in the presence of irrigation, that cotton is king and alfalfa is queen in Arizona. Judging from the experience of other states, the dairy cow will inevitably become the guiding inspiration of those who plan to develop a well balanced agriculture to meet the growing needs of a progressive new state. What is the matter with cotton, alfalfa, corn, and dairy cows as a diversified scheme for the irrigated regions of the Southwest?

The Arizona State Fair was held the week of November 8th. In facilities for housing exhibits and the general lay-out, the grounds and equipment meet the situation well. The visitor from a distance is struck by the number of games of chance and fakir outfits. It still seems necessary, also, for the amusement of onlookers, to rope and maul a poor, defenseless, emaciated steer.

Two things are imperatively needed: there are sanitary facilities for the grounds and an open air pavilion for the judging of live stock in the shade. With the strides the state is making these improvements ought not and probably will not be long delayed.

The Dairy Herds

In the dairy building appropriate attention was given to farm dairying and market milk production through comprehensive exhibits arranged by the University of Arizona.

(Continued on page 957)

JUDGING HOLSTEINS AT THE ARIZONA STATE FAIR

New York Dairymen's Annual Meeting

H. H. LYON, NEW YORK

THE New York State Dairymen's Association recently held its 44th annual meeting in Watertown. President Troy spoke of the splendid dairy conditions across the northern portions of the state. He suggested the high degree of development of the people in the dairying sections that not only does this industry develop soils but men as well. There is much being learned about the value of dairy products and this knowledge is likely to assist greatly in the work of combatting the use of oleo. He called attention to the experiments at Rochester showing the greatly superior development of children when butter was used instead of oleo. These figures have been published in Hoard's Dairyman. Then he mentioned our low annual consumption of cheese of 3.8 lbs. per capita, while Switzerland makes use of 26.4 lbs. Butter is used in the United States to the extent of 17.4 lbs., while Australia makes use of 25.8 lbs. If we increased our cheese consumption, even to ten pounds per capita, it would require six billion more pounds of milk to provide it and would relieve any congestion of supply.

⚜

The look of the city man upon the Agriculture of the state was given by John B. Harris. He deplored the "scraps" between dairymen and distributors of milk. He called attention to the strange attitude of the public when prices of dairy products went up as did all else except that dairy products went up in a lesser degree. He advocated advertising dairy products.

⚜

State Commissioner of Agriculture Hogue deplored the attitude of the Federal Reserve Banks in restricting credit during harvesting season. It only lowers the farmer's prices and does the consumer no good. Restricting credits has caused the loss of vast quantities of produce which has not been harvested because of such restrictions. Mr. Hogue stated the numbers of cows in the state in 1918 was 1,023,034 and in 1919, 1,146,727. The increased milk production was from 4,436,923,413 lbs. in 1913 to a production of 5,212,769,749 lbs. in 1919. Then he showed that June has double the quantity of milk that December has. We need to pay enough for December milk so that it will pay to produce it, for milk is needed at that time.

⚜

In his address, Geo. L. Flanders, veteran counsel of the New York Department of Agriculture, stated that the American people are rather too tolerant, and that, when wakened up, they sometimes go too far as in the case of the oleo laws. They waited until adulteration of dairy products went so far as to create rebellion and laws were made too drastic. After much work and opposition a law was had that overdid.

Federal courts, he said, do not uphold state laws, but they do presume to say whether a state law conflicts with the powers given to the federal government. There is now a bill prepared which if enacted into law would permit the shipment of goods in package form by interstate shipments and would forbid the state to interfere. The state under this act could look after its own residents and forbid their selling oleo or other products under certain conditions, but citizens of other states might ship it in and be protected. This would apply to all foods, drugs, and medicines, which might mean many things in addition to oleo.

⚜

Mr. Richardson, a cheese dealer of Lowville, spoke of the difficulties of the cheese man. He did not claim that the middleman is perfect but thinks he performs a service. He must advertise largely and get in position to serve. He is not superfluous and is entitled to what he makes. The cost in the cheese business is not much over two per cent exclusive of freight. This he thinks is not excessive and would not be up to five per cent. He is not desirous of rapping co-operative marketing, but it too may be superfluous. Prices are low, partly due to the heavy losses on cheese last year. We must look for lower prices in all lines and the outlook for cheese is as bright as any. There was a large output of poor cheese last year owing to weather conditions. It hurt the market. This year has seen the best cheese that has been made in ten years. New York must do everything to keep up the quality of cheese. We have yet to put much milk in cheese in this state. Wash curd cheese is demanded by certain sections and is to be in demand in the future as well as the hard cheese. It is quality that counts in either case. Professor Troy thinks that we should have distinctive names. Now we are unable to designate any particular kind. Buyers at the retail stores do not know what they get when they order cheese.

⚜

Mr. Horace Reese, the veteran cheese maker of Lowville, said that it isn't necessary to make any poor cheese. It is up to the maker. Have the milk in fine condition. The maker needs to exercise the neatness he would expect in the making of his bread. The milk will be good if the maker is up to his job. Speak to the farmer with a good big smile on your face, and do it at the first instance where there is a lack of quality in the milk. Coach the farmer, not abuse him. Don't hurry the make too rapidly. It takes five hours to do a good job. Mr. Reese went into details as to manufacture. In finishing up, take pains. Have cheese uniform in size and appearance. The man who takes pains in this will take pains all through the process. He will have good cheese. Wisconsin does not make any part of skim cheese and we should not. Skims will affect our reputation unfavorably.

⚜

Mr. Nathans, the secretary of the milk dealers' conference board, presented a paper somewhat along the lines of the circular matter that the dealers have been sending out. He tried to show that the League has been forcing prices too high all summer, that the Nestles Company have been driven to the last ditch and can stand no more. They must rebel against such drastic and unreasoning tyranny. The dairying conditions were pictured as the worst that have ever been known. There is sale in this country for only twenty million cases of condensed milk and the export markets for condensed are rapidly disappearing. I am not trying to quote the words of the speaker, but I believe I have the tone of his argument. It is not for me to take up the cudgel, but unless the dealers have been abused far in excess of anything we know of the attitude of the speaker was unjustifiable. If it is a sample of the sort of argument our League officials have had to contend with, I wonder how they can refrain from extreme combativeness.

⚜

The last day of the convention was opened by an address by Dean Mann of the college of agriculture. He spoke of the general difficulty in disposing of agricultural productions. There has been a readjustment over many years. After the Civil War, we opened up land much faster than the population increased. At the same time, the people continued to drift more from the country to towns. He went on to note the tendency toward deflation and the increase in the difficulty to secure money, due to the rather rapid movements on the part of the government. High interest rates mean that money is bid for by those who can best pay the interest. An additional point is psychological.

The dean called attention to the advantage had by manufacturers during the war over that of agriculture. The farmer had not had an equal advantage and it is a problem of fairness. Our exports are not large in percentages, particularly in manufacing lines. It may be one to three per cent in manufacturing and practically fourteen per cent in agricultural production. In both cases it is something concerning the disposition of surplus.

The chief of tuberculosis eradication of the federal government spoke at length regarding his work, leading up to the accredited herd plan. There is not a large amount of animal tuberculosis except in a few localities. The work started in 1918 and has developed rapidly. The method of detecting tuberculosis was determined in 1890. It came to be a diagnostic agency and is fairly accurate though not 100 per cent efficient. There may be a reaction at the point of application or at the point of the disease and still not react as a temperature change. However, the tuberculin test is by far the fairest. The intradermal method sets up local reaction and can be worked more rapidly. It is considered as certain as the subcutaneous. It is possible for all the herds of a county to be tested and the whole county cleared up without waiting for the accredited herd plan to be worked out. It will go as fast as the people want it. It will never be made compulsory. It is up to owners.

The accredited herd plan in New York was discussed by D. W. McLaury, director of the State Bureau of Animal Industry. It is noted that the status has changed since first commenced two years ago. Then it was a case of getting somebody interested; Now it is a question of doing the work. Mr. McLaury finds that tuberculosis has increased in the state in fifteen years. It needs to be checked at once. It is being done. We are, in New York, testing as many animals as any state in the country. We have 1,300 herds, but these average at least thirty animals. The law was changed last winter so that animals generalized will be paid for the same as those with localized lesions.

⚜

The nominating committee reported for president, H. B. Richardson, with H. E. Cook as vice-president. Mr. Tignin was continued as secretary and Mr. Kirkland as treasurer. This report was adopted. Mr. Richardson, being called upon, asserted that his desire is to increase the attendance of real farm people at the next annual session. These men are from northern New York mainly and it is fair to guess that Watertown will get consideration when the place of meaning is to be determined.

⚜

The paper of P. H. Kieffer of New York City on the question of improving the quality of butter was read by Professor Ross, Mr. Kieffer being unable to be present. The paper stated that two things are necessary—good material and good workmanship. The maker should be experienced and educated in his line. It takes a specially good man to make good butter in all cases. He needs three years' experience as a helper and a short course at the dairy school.

Good material, careful pasteurization, and prompt cooling are very important. The speaker also said a bit about the Danish butter now coming to this country in quantities of 500,000 lbs. a week. It is quite a commentary, remarked Professor Troy, that this butter comes from so far and proves of such uniform and superior quality. We complain because the public does not use more dairy products but a reason is found in the uncertain quality. We must get uniformity. Any good butter that continues uniform will make a market for itself. Milk for butter should be as good as that for marketing purposes, but it may be possible to have a higher acidity. The reason for pasteurization is to destroy disease germs in the case of market milk. The resolutions of this convention were unusually brief. One urged the defeat of the Calder Senate bill relating to provisions for interstate transportation and sale of package goods which would prevent states from controlling the sale of oleo and other products brought from other states, and a house bill that if enacted would also aid certain interests not desired by farmers.

MILKERS AND ONE OF THE HOLSTEINS IN THE IOWA SOLDIERS' ORPHANS' HOME

These boys milk 32 cows, using machines. From left to right they are: Harry Wadenton, Merl Hammond, Forrest Mitchell, James Green, and Bert Wilson.

Cow Testing Associations

RECORDS, PRICES OF FEEDS, FAT, AND MILK

Following is the summary of reports received during the week and up to the time of going to press of this issue:

Association Notes

Dallas County, Iowa:—Feed prices for early November, by the ton, are: corn and cob meal, $20; oats, $25; bran, $37; oil meal, $60; cottonseed meal, $55; alfalfa, $30; clover, $25; silage, $8. Milk sold for $3.75 per cwt., a test of 3.5% being required and 5c paid per point above.

Knox County, Illinois:—Seven unprofitable cows were disposed of during November. Two pure-breds and four exceptionally high producing grades were purchased by members of the association. At present six herds have been tested for tuberculosis and 12 more members have agreed to have their herds tested. Seven of the members are using milking machines which are giving perfect satisfaction. More are planning on installing mechanical milkers in the near future. Most of the farmers are feeding balanced rations. November market milk testing 3.5% sold for $4.08 per cwt. and 9c per point above. The creamery paid 60c per lb. for fat. Milk retails for 17c per quart and butter for 75c per lb. Feed prices are as follows: corn and cob meal, $1 per cwt.; ground oats, $2; cottonseed meal, $3.25; oil meal, $3.65; wheat bran, $2.15; Cow Chow, $2.50; alfalfa hay, $29 per ton; clover hay, $20.

Adams County, Illinois:—There are some unprofitable cows in the association, but the members are waiting for a better market. Two pure-bred bulls were purchased during the month of October and the association bought a carload of pure-bred and grade Holstein cows and heifers in Lake County through the I. A. A. One carload of cottonseed meal was purchased. October milk testing 3% sold for $3.96 to $5.85 per cwt. Milk retails for 16c per quart and butter for 70c per lb. Feeds are rated as follows: alfalfa, $25 per ton; clover, $20; silage, $8; corn, 85c per bushel; oats 62c; cottonseed meal, $3.15 per cwt.; bran, $1.95.

De Kalb County, Illinois:—Seven "boarders" were sold during November. Three pure-bred bulls were purchased, one a 37-lb. grandson of King Korndyke Sadie Vale. In November $3.05 was paid for 3.5% market milk, and 4c per point above this test. Bran sold for $1.80 per cwt.; barley, $1.70; corn, $1.14; oats, $1.50; oil meal, $3.25; cottonseed meal, $2.75; gluten, $2.50; Unicorn, $3.50; clover hay, $30 per ton; alfalfa hay, $35.

Effingham County, Illinois:—Eighteen pure-bred females and one pure-bred bull were purchased during November. Seven of these animals were purchased at the National Dairy Show and have very good backing and individuality. Market milk sold for $2.90 per cwt. and 4c per point above 3.5%. The creamery paid 52c per lb. for fat. Milk retails at 15c per quart and butter at 65c per lb. Feed prices are: corn, $20 per ton; oats, $43.60; bran, $42; cottonseed meal, $68; oil meal, $70; Purina Cow Chow, $70; silage, $7; alfalfa, $30.

Tri-County, Illinois:—One pure-bred Holstein bull calf, one pure-bred Jersey bull calf, two pure-bred Jersey heifer calves, and three grade Holstein cows were purchased during November. One member has a new carrier in his dairy barn, thus lessening the labor of caring for his cows. One unprofitable cow has been disposed of during the month. In November 3% market milk sold for $3.90 and 3.5% milk for $4. A test of 3% was required, 2c being paid for each point above, up to 3.5% and 5c per point above 3.5%. The creamery paid 59c per lb. for fat. Milk retails for 16⅔c per quart and butter for 70c per lb. Feed prices are: brown middlings, $42 per ton; gray middlings, $45; bran, $38; hominy hearts, $42; Purina Cow Chow, $70; cottonseed meal, $50; oil meal, $75; alfalfa, $32; clover, $30; oats, 65c per bushel; corn, 85c; barley, $1.15 per bushel.

Wausau—Marathon, Wisconsin:—Two more herds were tested for tuberculosis during November, making a total of twelve tuberculin tested herds in the association. Farmers are giving their fresh cows better care than we did a year ago, which shows they are interested in better records. Four unprofitable cows were sold to the butcher during the month. November market milk sold for $2.40 per cwt., a test of 4% being required and 6c paid for each point above. The creamery paid 60c per lb. for fat and the cheese factory paid 59c per lb. Milk retails for 15c per quart, butter for 62c per lb., and cheese for 38c per lb. Hay sold for $20 per ton; silage, $6; Wisconsin Balanced Ration, $53; International Dairy Feed, $48; hominy, $46; corn meal, $46; bran, $36; oil meal, $63; oats, 55c per bushel; barley, $1.10 per bushel.

Fort Atkinson, Wisconsin:—November market milk testing 3.5% sold for $2.30 per cwt. The creamery paid 62—65c per lb. for fat and the condensery paid 67c per lb. Local feed prices are: alfalfa hay, $28 per ton; clover hay, $24; wild hay, $12; corn, $28; barley, $90; bran, $35—$40; oil meal, $69; gluten, $68; oats, 60c per bushel.

First Portage, Ohio:—Of the twenty herds in this association, thirteen are headed by pure-bred sires. Seven of the herds are tuberculin tested. Several dairymen are making their herds more profitable by weeding out the unprofitable cows. Much young stock is being raised for dairy purposes. Market milk in November, testing 3.5%, sold for $3.55 per cwt. and 5c per point above this test. Milk retails for 14c per quart, butter for 72c per lb., and cheese for 44c per lb. Feed prices are: gluten, $2.80 per cwt.; oil meal, $3.10; cottonseed meal, $3.10; corn, $1.35; middlings, $3.10; bran, $2.60; hay, $25 per ton; fodder, $7; silage, $8; ground oats, 70c per bushel.

Every Farm Should Have It

The Stewart No. 1 Clipping Machine is an essential part of the modern farm equipment. Any owner of cows, horses or mules needs it the year round.

Right now, and as long as cows are stabled, it's a necessity for keeping the hair short on udder or flanks and as an aid to clean milk production. These parts are then quickly and easily cleaned before milking, and manure and other filth is kept out of the milk pail.

Whether a producer of high grade certified milk, or a distributor of ordinary commercial milk, the clipping machine should be used regularly on your herd. Compulsory now in many communities, the requirement will soon be general.

Clips cows all over in the spring—keeps them through the summer in comfort; clips young stock to free them from lice or ticks; clips horses or mules spring and fall. Same machine for all—no change in knives or adjustments.

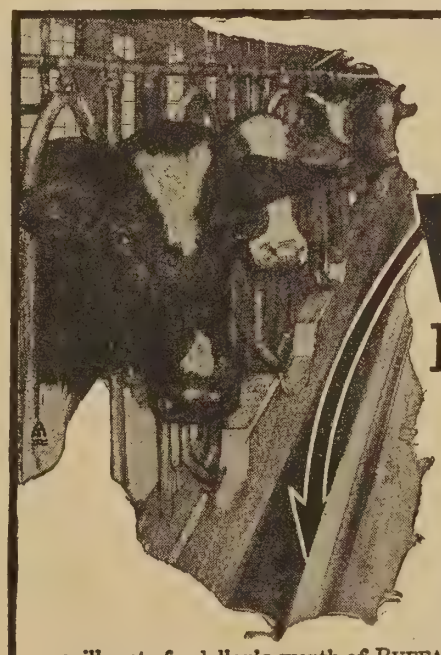
Stewart No. 1 Clipping Machine

Clips Cows, Horses and Mules

Price $14.00

The Stewart No. 1 is a quality product, backed by a company with a record of thirty years of honest manufacturing. Superior construction. Gears cut from solid steel bar, hardened file hard by our own special process—they stand up under long, severe service. Clipping plates of razor steel—reputation unexcelled—hold keen cutting edge longer than any other. Metal gear case dust and dirt proof—gears run continuously in oil. Easily operated—ball bearings reduce friction. Six foot flexible shaft. Machine compact—set up or taken down quickly—weighs only thirty pounds.

Wouldn't Take $100 for His Machine If He Couldn't Get Another



JAYEMA FARM
St. Johnsbury, Vt., Dec., 15, 1919

It gives me pleasure to commend to others the cliping machine which you make. No one not trying one has any idea of the difference in the amount of dirt in milk pails. Aside from this the work of caring for a herd is reduced to the minimum. I wouldn't take $100 for my machine if I could not secure another from you for my barns. It is a wonder and good every day in the year.
J. M. Allen, Prop.

The Stewart No. 1 is the standard clipping machine of the entire world. Clips cows, horses or mules. Only $14.00 at your dealer's, or send $2.00 and pay balance on arrival.

Electric Clipping Machine, 110 volts A. C., $80

Chicago Flexible Shaft Company
Dept. A 156
5600 Roosevelt Road, Chicago

WHAT
Do *you* put in *there?*

FEED, yes. But—WHAT KIND is it?

At the fairs and dairy shows, many of the most successful dairymen tell us they get more dollars' worth of milk out of a dollar's worth of BUFFALO CORN GLUTEN FEED, fed mixed with wheat bran or millfeed, oats, etc., than any feed they know of.

They probably never had anybody offer a reason *why* BUFFALO CORN GLUTEN FEED makes milk the way it does. They did not care WHY so much, as long as they got the milk. But the *very high digestibility*, in large measure, *accounts for it.*

See that there is plenty of BUFFALO CORN GLUTEN FEED mixture in the feed trough in front of your cows—and you will understand *why* BUFFALO CORN GLUTEN FEED is so well thought of on thousands of real dairy farms.

FEED UP! Your dealer should have BUFFALO CORN GLUTEN FEED. If he does not, write us for literature and sample, giving us his name and address.

Corn Products Refining Co.
New York MANUFACTURERS OF Chicago

BUFFALO CORN GLUTEN FEED

Paterson vegetable parchment wrappers

Make wrappers pay a profit!

THERE'S money in butter wrappers if you use the right kind.

Paterson Vegetable Parchment Wrappers are the right kind. With your advertisement printed on them, they catch the eye of the consumer.

Butter wrapped in them retains every good quality it had when churned. They keep butter sweet and wholesome. They pay a profit because they increase your business. In lots of 5000 we'll print your brand advertisement on them in inks that will not stain the butter.

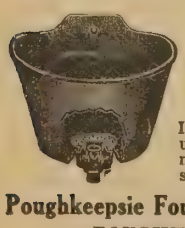
PATERSON PARCHMENT PAPER CO.
PASSAIC, N. J.

Empire Oil-Burning Tank Heater

Greatest improvement ever made in tank heaters. Fits any tank. Burns from 14 to 16 hours on one gallon of kerosene. Any child can operate it with safety; no sparks, ashes or smoke. The heating chamber is entirely under water; no heat wasted. Guaranteed. Saves feed—pays for itself repeatedly.

Empire Non-Freezable Hog Waterer

Made of heavy galvanized iron—large capacity (70 gal.); drinking trough on outside where hogs can reach it; oil burner directly under trough—guaranteed not to freeze. Keeps water warm at a small cost. An abundance of fresh, clean water at right temperature. Keeps hogs healthy—fatten faster on the same feed.



FARMER AGENTS

Special offer to farmers willing to show our Heater and Waterer to prospective buyers. Write at once for price and special offer. Buy direct from factory.

Empire Tank Heater Co.
109 N. 7th Street

Must Pigs Root? Evvard Says No

(Continued from page 951)

fed this way and all had the same start. Pigs of the various breeds are selected as near an age and weight as possible and all started on their various trials on the same day. This year it was July 22 at the afternoon feeding. There were thirty-one pens in all, two of them being pastured on blue grass, as was mentioned above in the rooting work, and the rest given rape. At the end of three months all results are checked up and tabulated.

Many feeds were tried out including hominy feeds, containing 10% protein; specially prepared feeds containing corn feed meal, alfalfa meal, peanut and cocoanut meal, ground blood meal, oats, molasses, and barley; corn germ meal with oil extracted; ground barley, corn gluten feed, oil meal, wheat shorts, tankage, salt, and molasses; corn feed meal, ground barley, wheat middlings, oil meal, alfalfa meal, and salt. All feeds contained from 10 to 20% protein by analysis and between 4 and 6% fat.

THE IOWA MOVABLE HOG HOUSE AFIELD

"This is a good hog house because it gives good results. Its good points are many: Provides shade in summer through the swinging upward of the wall door; gives air to the pigs through the ventilating devices, which note in the peak ends, especially valuable in winter or any time when shade doors are down; furnishes high side walls which give upright and capacity room for men, hogs, and self-feeders, and naturally makes possible more utilizable floor space than in the A type of house; promotes convenience in that the far roof has doors in it, 'side hung' doors, that swing upward, thus permitting attendant to work to better advantage, encouraging airing and sunning, and aiding in better inspection of the housed herd; and makes possible, because of its substantial, stalwart construction, a long period of service. We have had some of these houses at Ames for practically fifteen years, and they are still going strong. To date, we have never scrapped a single one."—JOHN M. EVVARD.

The best results with these feeds were made by the hominy feeds. They were figured from the check results which were 236 lbs. gain for the period, a daily gain of 1.52 lbs., a daily amount of feed consumed amounting to 5.7 lbs. and requiring 347 lbs. of corn and 28 lbs. of tankage for every 100 lbs. of flesh produced.

The best hominy result showed a final weight of 237 lbs., average daily gain of 1.57 lbs., daily consumption of 5.5 lbs. and requiring 319 lbs. of hominy feed and 31 pounds of tankage for 100 pounds of gain. This was yellow corn hominy and the problem of whether or not yellow corn is better seemed to have a point when we examined the group fed white hominy. This lot had a final weight of 228 lbs., average daily gain of 1.46 lbs., consumption per day of 5.2 lbs., and required 325 lbs. of hominy and 33 lbs. of tankage. In the matter of cost the check ration cost $9.10 per 100 lbs. gain while the yellow hominy test cost $11.17 and the white cost $10.80.

The poorest results came with a feed containing considerable molasses which showed a final weight of 190 lbs., a daily gain of 1.08 lbs. with a daily consumption of 5.0 lbs. and a requirement of 389 lbs. of corn and 74 lbs. of the molasses feed for every hundred pounds gain. This feed cost only $11.37 per 100 lbs. gain but would have been fed at a loss as compared with the check ration. This difference is attributed to the pig's natural aversion to sweet feeds of any kind and whenever there was molasses in the ration the pigs did not do very well.

Another experiment in the line of forage crops was announced by Mr. Evvard when he told of comparing alfalfa pasture and the new sudan grass for sows. Several lots were put out on the pastures with no grain given them. They all had salt. Others were given the pastures and two pounds of shelled corn daily.

Sows on the lots with no grain in both cases lost weight but the sows on the sudan grass lost .014 more than those on the alfalfa. The ones on the pastures plus the shelled corn acted differently. Those on the alfalfa plus corn gained daily while those on the sudan plus corn lost.

Alfalfa had the best record as a long season crop. It is good to use in the middle of May and runs until the middle of November. Sudan grass is not good for pasture until June 15 and goes with the first frost, which this year came the 5th of October. Also two crops of hay were cut off the alfalfa lot while only one was removed from the sudan grass. This of course is an item worthy of the farmer's attention.

SOLID COMFORT

"Make things comfortable for the pigs so that they can rest, yes, snooze more. You ask why? Because the fattening pig may burn up too much feed when standing unnecessarily on his feet, thus wasting the precious energy resources that we need to conserve."—JOHN M. EVVARD.

MAKING THE MOST OF RAPE

"Rape, pig feed meritorious, a crop that is worth the while, one that comes early in June and stays until old Jack Frost gives it a terrific wallop. Pasture it so that it just keeps ahead of the hogs' appetite—and then in late October, when the rape growing season has waned, turn the extra stock afield to gather up the high protein, high mineral, high vitamine carrying leaves."—JOHN M. EVVARD.

Corn gluten feed was tried out to see if its possibilities as a feed for fattening fall pigs were worth while. It worked the best when fed in a ratio of one part gluten to three parts of tankage in a corn, tankage, salt ration. Where the gluten was fed alone in a free choice method in addition to corn, tankage, and salt it gave fair results but it increased the feed requirements and decreased the gains, as compared to the corn, salt, tankage ration.

The saving by feeding gluten was not very favorable and it was decided that as far as the Iowa tests are concerned the gluten makes a far better feed for cattle and sheep than it does as a hog feed. A little better statement can be made where the gluten was fed in a dry lot ration. It must be remembered that gluten does not contain the germ as does the corn oil cake meal. The latter is a very valuable hog feed.

These were the outstanding feat-

ures of the year's work and next year Mr. Evvard will have some interesting type tests, more feed experiments and some work with vitamine qualities. He is working on color tests in corn feeding on hogs and promises to have some good information.

Dairying at Arizona State Fair

(Continued from page 953)

The writer's attention was early attracted to the dairy cattle exhibit. It was the largest and best balanced feature of the live stock show. In all 175 head of dairy cattle of the four breeds were shown by fifteen different exhibitors. These were distributed according to breeds as follows: Ayrshire, 2 exhibitors, 63 animals; Holstein-Friesian, 8 exhibitors, 50 animals; Guernsey, 2 exhibitors, 33 animals; Jersey, 3 exhibitors, 29 animals. Every herd came from Arizona except one, the Guernsey herd from Hollow Hill Farm of California. Most of the animals were reasonably well fitted. But few were off type sufficiently to mar the show as a whole.

The State Champion

The Tempe State Normal School made a creditable display of Holstein-Friesians. With records covering several years, they were able to put punch into their statement. They showed the champion production cow of Arizona. She is Minnie Shadeland De Kol with a ten-month record of 16,498 lbs. of milk and 529.7 lbs. of butterfat. Her 2-year record is 30,132 lbs. of milk and 1,293.5 lbs. of butter. She is a cow of good size and great capacity, with plenty of quality.

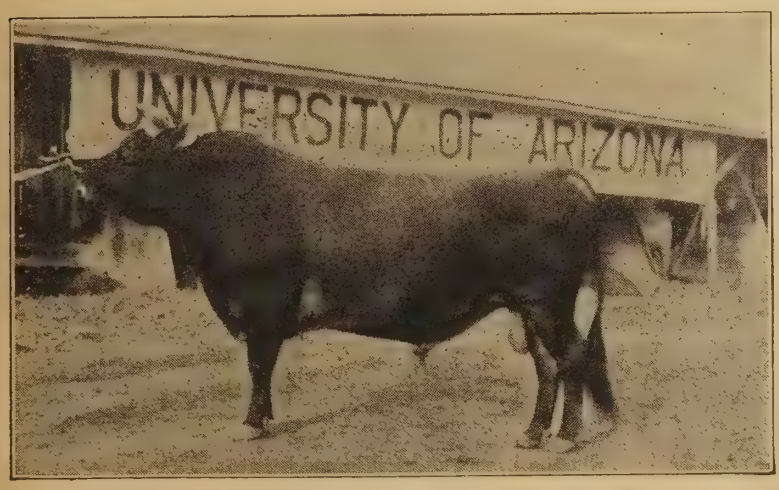
As a class the Ayrshires made a good show but no effort was made to feature any herd or the work of individuals. The Jerseys, likewise, were satisfactory, though in numbers and quality hardly equal to some other breeds.

While only two Guernsey herds were shown, the Guernsey display far outclassed others in the dairy divisions. The exhibit from Hollow Hill Farm was remarkable for its uniformity and quality. While coming from another state it set a high standard and Arizona breeders may well profit from the demonstration.

As indicating the character of the herd the record of a few individuals will be of interest. The 8-year-old cow, Imp. Cherry 3rd of the Effaids, is a fine individual and has 735 lbs. fat in the single letter class. She was first prize aged cow, senior champion, and grand champion at the Riverside Fair. In that show, she went above Imp. Cheminante 11th who was senior champion at the 1919 Dairy Show.

One particularly attractive heifer in the herd is Rosie E. King of Hollow Hill Farm. She has quality, type, and attractiveness all of her own. She was first junior yearling and junior champion at the 1920 California State Fair. Also, she won first junior champion, junior yearling, and reserve grand champion at the Riverside Fair. Here she stood ahead of the senior yearling that won over 44 heifers at the National Dairy Show, 1919.

The dairy exhibit speaks well for the type of pioneers who are building the future dairy business of Arizona. A new country, it naturally has unusual problems which are being met by original though effective methods. Reflecting, as the state fair exhibits did, the relatively large number of pure-bred herds of good quality, there should be the incentive and the means to keep economical production well abreast of demand.



Scub Bull Funeral

Some few weeks ago there were still two scrub bulls in use by two of the members of the Wilton Cow Testing Association. At a picnic held at Wilton, considerable attention was given to the funeral of the last scrub bull. A pure-bred Guernsey bull was hitched to an old top covered milk wagon which contained large frame crate representing the coffin. The bull which was hitched to this wagon is the animal which was purchased to replace the last scrub in the Wilton Association. The wagon was elaborately decorated with American flags.

The coffin was decorated with stick-tights and bull thistles. Mr. Gleis of Tomah, an attorney, served as undertaker and pastor. The fifteen-piece Tomah band was in the procession together with fifty automobiles which followed the coffin to a nearby bridge crossing the Kickapoo river. Upon arrival at the bridge, the coffin was thrown into the river.

There were 500 people in attendance at this picnic and funeral. It was reported that this funeral caused more excitement in the city of Wilton than any other funeral ever known of in Monroe County. Extreme gaiety was shown instead of sorrow and grief as is usually shown at a funeral. It is hoped that more of the associations throughout the state will follow in the footsteps of the members and tester in the Wilton Association.

At the present time we have fifty associations reporting 100 per cent free from scrub bulls. It is hoped that we can report at least ninety per cent on this list before another year goes by. The present forty-five per cent can easily be increased with the hearty co-operation of the members and testers in the associations where scrub bulls are still kept.—A. J. CRAMER, Supervisor.

Buy Permanent Protection

When you invest in a cream separator you can't afford to take chances with a machine that through faulty bowl construction retains particles to sour and taint the next day's skimming. You can't afford to buy a machine that destroys the body of the butterfat. You can't afford to use a machine that promotes unsanitary conditions in your dairy.

The one cream separator that will give you adequate protection against all of these faults is the

Primrose

Its bowl is absolutely free from holes and crevices in which milk can lodge. It is simple in construction, easy to wash. It skims at low speed, insuring the delivery of cream of the highest butter-making quality. Its clean lines and open base provide for sanitary conditions wherever it is used. Its rugged construction and automatic oiling system insure long life and easy running.

Bear these facts in mind when you are ready to buy a new cream separator.

San Joaquin Valley
California

There is but one California. It is a garden. It is a scenic paradise. It is the place of no winter. You get the most out of life for yourself and family. See it, this winter, when the East is snowbound.

You Can Farm All Year in California

Santa Fe

No storing costly fodder for months of snow and ice. Here you can profitably raise alfalfa, grain, fruit, stock and poultry. You have benefits of established communities. Schools are ready, and fine roads. The various fruit associations have a remarkable marketing system. You raise the fruit; no bother about markets. That problem has been worked out for you.

Land values still are within reasonable bounds—considering what you get in return. The San Joaquin Valley can support many thousands of families, on twenty and forty acre tracts. The world competes for what you raise, because of superior quality.

The Santa Fe operates *five trains a day* from Chicago and Kansas City to winterless California. Two of them—the California Limited and the San Francisco Limited—are *solid Pullman trains* with dining cars all the way. The Navajo, Scout and Missionary carry standard and tourist sleepers and chair cars; meals in dining-cars east of Kansas City and at station dining rooms west. Meal service for all trains by *Fred Harvey*. The two Limiteds and the Missionary have through sleepers by way of *Grand Canyon of Arizona*, the world's scenic wonder. The Santa Fe *tourist sleepers* are comfortable and you save half on the berth rate. Station meals also are economical—a "square meal" for a dollar.

Our illustrated folders, descriptive of California lands, and the trip there, mailed on request. Let me help you plan your trip, and advise about places worth looking over.

Countess Prue—World Champion Guernsey

SINCE February, 1915, Murne Cowan of the Anna Dean Farms, with a record of 1,098 lbs. of fat, has held the honor of being the world's champion Guernsey. It is an unusual honor, therefore, that now comes to Countess Prue, for not only has she established a new high record of production for the breed, but she is the only Guernsey cow in the world to exceed 1,100 pounds of butterfat in a year's production. On November 29 she completed her year's work, finishing with 18,626.9 pounds milk containing 1,103.28 pounds butterfat. This accomplishment will bring much fame to Riverdale Farm of Massachusetts, to the owner of the cow, F. L. Howes, and to her caretakers, Harry R. Robblee, manager, and Fred Burdick, herdsman.

Countess Prue merits the distinction which is hers, for she is a cow of splendid dairy conformation, of good breeding, and of refinement and beauty. It is not often that we have such a combination in one individual, although one should see her to really appreciate these facts. She is large, weighing about 1,300 pounds, has splendid spring of rib, depth through body and heart, and breedy head, with generous muzzle and nostrils that go with large digestive and lung capacity. She has good lines and an udder of excellent shape and texture. One of her outstanding characteristics is her quality throughout.

She is a cow of fine temperament, nothing unduly excites her. She seems rather to enjoy the presence of visitors, although it is easy to see that she much prefers Fred Burdick to anyone else. Mr. Burdick has personally fed and cared for her throughout her test, and while he has had a wonderful cow to work with, nevertheless he deserves much credit for his skill and good judgment in handling her. Not once while on test has she missed a feed through indisposition, and at the end is as full of vigor and as keen in appetite as at the beginning.

A careful study of the pedigree of this wonderful cow reveals the fact that she has an inherited right to her dairy conformation, beauty of form, and tremendous producing powers. She belongs to a family of capable and well formed animals. Her sire, Bell-founder, has come to the attention of Guernsey breeders during the past year through the records made by his daughters at Falcon's Flight and Riverdale Farms. He has at present sixteen in the list, whose twenty records average 12,627.72 pounds of milk containing 642.26 pounds butterfat. It is interesting to note that of these twenty records, completed by the sixteen daughters of Bell-founder, one has made over 1,100 lbs. fat, one over 900 lbs., one over 800 lbs., three over 700 lbs., four over 600 lbs., seven over 500 lbs., and only three under 500 lbs.—the least being 418.78 lbs. of butterfat. Bell-founder, through his sire, is a grandson of Imp. Island Champion. His dam, Imp. Island Blossom, was a daughter of Imp. France's Masher 2d and is a sister of the great Guernsey matrons, France's Milk Maid and Anton's Frances. Imp France's Masher 2d, being a son of Imp. Island Champion, Bell-founder gets Masher blood through his dam as well as his sire.

Countess Prue has a previous record made in class B of 13,172.9 lbs. milk containing 709.21 lbs. butterfat. Her full sister, Polly of Falcon's Flight, made 14,133.3 lbs. milk containing 728.79 lbs. butterfat. Another sister, My Fancy of Falcon's Flight, now owned by George W. St. Amant, has just completed an official record of 18,214.7 lbs. milk containing 979.11 pounds butterfat, which entitles her to eighth place in class A. It is surely an unusual happening that two daughters of one bull take a place among the leaders of class A within a month of each other.

Guernsey breeders are familiar with the records of Monobelle, another daughter of Bell-founder, with 546.61 lbs. of butterfat in class B and 16,724.5 lbs. milk containing 847.64 lbs. butterfat in class A. In the next box stall to Countess Prue at Riverdale is another sister, Blanco, that finished early in December with a record of over 800 lbs. butterfat.

Countess Prue was born December 20, 1912, and was bred by Joseph A. Blake of Connecticut. In April, 1914, she was sold to B. Austin Cheney and remained in his Falcon's Flight herd until September, 1917, when she was sold to her present owner. She has two daughters, Prudence of Falcon's Flight, sired by a grandson of Imp. May Rose King, and Duchess Prue of Riverdale, sired by Cottina's Goldseeker of A. D. F. Duchess Prue of Riverdale was born on Nov. 26, 1919, just previous to the beginning of this epoch making record, and has been recently sold by Mr. Howes for a high figure to H. H. Buckley of New York.

The Massachusetts Experiment Station supervised this record of Countess Prue. Her record was confirmed by testers from Vermont, Connecticut, New Jersey, Pennsylvania, Delaware, and Maryland. Besides the regular tests she had ten automatic retests, and two special retests by Massachusetts testers, and eight special tests made by testers from other states. During the year she was under official supervision on an average of one day in every five.

Her highest month in the production of milk was January, the second month on test, while her highest month in the production of butterfat was March, the fourth month. In both March and May she produced more than 100 pounds of butterfat—107.16 pounds in March and 103.38 pounds in May. Her lowest month in both milk and butterfat was September, the tenth month, when she produced 1,247.9 pounds of milk and 79.87 pounds of butterfat. Her lowest day's production of milk was 36.8 pounds on August 23, during a period of excessive heat. Her highest production was 63.7 pounds on January 4.

She was an unusually high tester throughout. Her lowest test for any month being 5.03 per cent for December, the first month of her test, and the highest 6.76 per cent in October, the eleventh month. The owner's statement of feed is as follows:

December—578.2 lbs. grain: 82.6 lbs. bran, 41.3 lbs. each hominy, ground oats, gluten feed, cottonseed meal, oil meal, and alfalfa meal, 123.9 lbs. each Unicorn Dairy Ration and Schumacher Feed; 465 lbs. beet pulp, 620 lbs. each silage and mixed hay.

January—660.8 lbs. grain: 82.6 lbs. each bran, cottonseed meal, and alfalfa meal, 41.3 lbs. each hominy, ground oats, gluten feed, and oil meal, 123.9 lbs. each Unicorn Dairy Ration and Schumacher Feed; 600 lbs. beet pulp, 930 lbs. silage, 630 lbs. mixed hay.

February—580.5 lbs. grain: 77.4 lbs. each bran and cottonseed meal, 38.7 lbs. each hominy, ground oats, gluten feed, oil meal, and alfalfa

meal, 116.1 lbs. each Unicorn Dairy Ration and Schumacher Feed; 435 lbs. beet pulp, 870 lbs. silage, 435 lbs. mixed hay.

March—619.5 lbs. grain: 82.6 lbs. each bran and cottonseed meal, 41.3 lbs. each hominy, ground oats, gluten feed, oil meal, and alfalfa meal, 123.9 lbs. each Unicorn Dairy Ration and Schumacher Feed; 620 lbs. each beet pulp, silage, and hay.

April—600 lbs. grain: 80 lbs. each bran and cottonseed meal, 40 lbs. each hominy, ground oats, gluten feed, oil meal, and alfalfa meal, 120 lbs. each Unicorn Dairy Ration and Schumacher Feed; 450 lbs. each beet pulp and mixed hay, 900 lbs. silage.

May—Same grain ration as April; 450 lbs. each beet pulp and mixed hay, 620 lbs. silage.

June—20 lbs. daily of the following mixture: 300 lbs. bran, 200 lbs. each hominy, gluten feed, cottonseed meal, oil meal, and alfalfa meal, 100 lbs. each corn meal and ground oats, 600 lbs. Schumacher Feed; 20 lbs. beet pulp, green oats, peas, and clover.

July—20 lbs. daily of the following mixture: 400 lbs. bran, 200 lbs. each hominy, gluten feed, cottonseed meal, and alfalfa meal, 100 lbs. each corn meal and oil meal, 250 lbs. ground oats, 300 lbs. each Unicorn Dairy Ration and Schumacher Feed; 15 lbs. beet pulp, green oats, and mixed hay.

August—20 lbs. daily of the following mixture: 300 lbs. each bran, Unicorn Dairy Ration, and Schumacher Feed, 100 lbs. each hominy, corn meal, gluten feed, cottonseed meal, oil meal, 250 lbs. ground oats, 200 lbs. alfalfa meal; 15 lbs. beet pulp, green clover.

September—Same grain ration as August; 10 lbs. each beet pulp and mixed hay, green clover.

October—20 lbs. daily of the following mixture: 300 lbs. each bran, Unicorn Dairy Ration, and Schumacher Feed, 100 lbs. each hominy, gluten feed, cottonseed meal, and oil meal, 50 lbs. corn meal, 200 lbs. ground oats, 150 lbs. alfalfa meal; 15 lbs. beet pulp, 10 lbs. each silage and mixed hay, 30 lbs. carrots and turnips.

November—22 lbs. daily of the following mixture: 300 lbs. each bran, Unicorn Dairy Ration, and Schumacher Feed, 100 lbs. each hominy, corn meal, and gluten feed, 200 lbs. ground oats, 150 lbs. each cottonseed meal, oil meal, and alfalfa meal; 15 lbs. each beet pulp and mixed hay, 20 lbs. silage, 30 lbs. carrots and turnips.

Official Year's Record, Class A

1919	Milk Lbs.	Butterfat %	Butterfat Lbs.
December 1	1,746.2	5.03	87.83
January, 1920	1,881.3	5.08	95.57
February	1,759.1	5.57	97.98
March	1,771.3	6.05	107.16
April	1,685.3	5.83	98.25

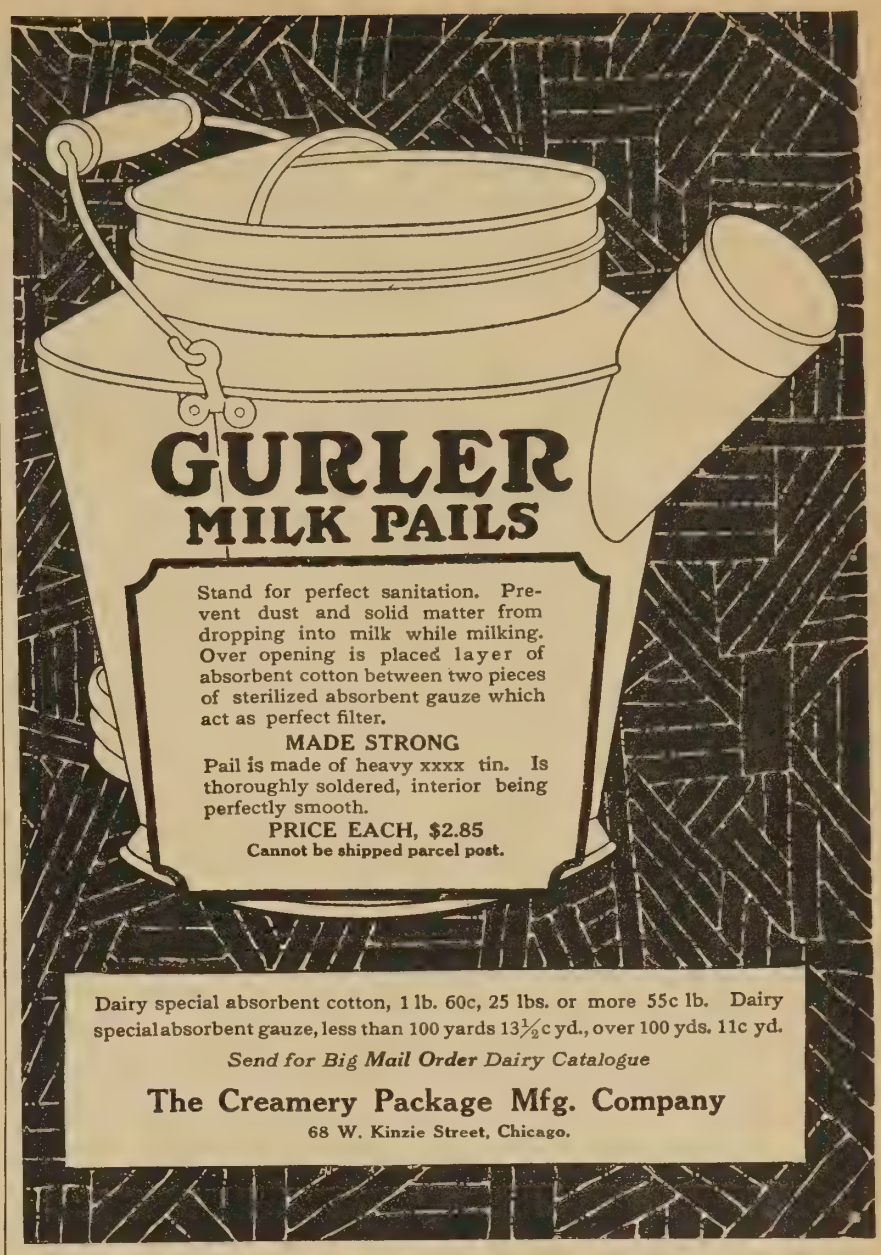
Illinois Holstein-Friesian Association Reorganized

The state-wide campaign for membership in the Illinois Holstein-Friesian Breeders' Association was conducted according to schedule Nov. 15-25. Two series of meetings were held simultaneously in the northern and southern sections of the state. Through this campaign Illinois breeders are assured of a working program for the next three years. The preliminary subscriptions amounted to over $15,000 for the three years with at least another $10,000 available on the follow-up campaign which will be conducted by the breeders themselves.

The ten days of the Illinois campaign fitted in with the week that the New England campaign was not going on, owing to the National Grange meeting in Boston. This made it possible for the National Association to lend its help. R. C. Pollock, in charge of the organization work for the National Association, attended all the meetings of the northern series, and F. A. Koenig, also of the National Association, accompanied the southern crew.



Illinois breeders some time ago divided the state into five districts according to Holstein population. Each district is in charge of a vice-president and is again divided into three sections, each section in charge of a director. The directors are responsible to the vice-president for their sections, and the vice-presidents to the state association for their district. This plan makes it possible to carry on a follow-up campaign until every Holstein breeder in the state has joined the state association on an equal footing with the other members.

Illinois, as the organizations in other states, welcomes the grade Holstein owners into the association, realizing that the owner of grades today is the pure-bred breeder of tomorrow. A great number of pure-bred bulls are heading the grade herds all over the country and demonstrating the value of pure blood lines in increasing milk production and improving type and quality of the milking herd.

Illinois is the seventh state organized by its breeders with the co-operation of National Association, the others being Ohio, Wisconsin, New York, Michigan, New Jersey, and the New England States which was completed by December 9th. The total number of organized Holstein centers in the United States is now ten, eacn having one or more men putting in their entire time in the interests of Holstein breeders who employ them. These sections are Minnesota, the first to put the plan of a paid secretary in operation, Ohio, Wisconsin, New York, Michigan, New Jersey, the New England States, Illinois, Iowa, and, most recently, Missouri. The breeders in these states have realized that combined effort and a single policy of promotion of Holstein interests within their own borders and intelligent advertising to attract outside buyers is the only solution towards making business more profitable each year.

Each of these organizations conducts its business through a board of directors elected by the breeders within the state. They hire their field men to direct the nature of the work they want done, and in general decide on the best means of furthering Holstein interests.

The New England breeders will by the first of the new year have a secretary on the job working out their problems.—National Holstein-Friesian Extension.

Two Ways to Spell a Good Thing

Teacher: "Spell Dessert."
Bobbie: "Is it where the camels live?"
Teacher (severely): "Certainly not. It is the best part of dinner."
Bobbie: "Oh, I can spell that—

"J-E-L-L-O"

Nobody knows better than the children what the best part of dinner is, and Bobbie expresses the prevailing conviction regarding it.

Delicious pure fruit flavors, freshness, wholesomeness and sparkle—these are famous Jell-O qualities.

And nothing to do but add boiling water, cool and serve.

Put up in six pure fruit flavors: Strawberry, Raspberry, Lemon, Orange, Cherry, Chocolate.

Each in a separate package, at any grocer's or any general store.

EDITORIAL COMMENT

SELL FEED THROUGH COWS

Corn sold for $24 per ton in Chicago the last week in November, with other grains at comparable values. The net to the producer is considerably less. The Chicago price of whole milk was $3.55 per 100 lbs. for November, while in the main markets cheese brought 25 cents per pound and 92 score butter was worth 57 cents. These prices represent declines in the returns from dairy products and in themselves are not cheering, but, comparatively, they are very satisfactory. The dairy farmer has the best market for his feeds. He need not rush his grains onto a glutted market; he can sell through his cows to much better profit.

Many months have passed since feed prices have been as favorable to profitable milk production as today. Milk, butter, and cheese have gone down in price, but not at the rate of the decline in feeds. A concentrate mixture can be made for about fifty per cent of its cost a year ago. The owner of dairy cattle now finds himself in a better position than at any time for months past, and better than that of those who do not own cows. It is bad judgment not to feed good rations now in liberal quantity. If the extreme high prices of past months and the difficulty in obtaining feeds suited to a first class ration made excuse for scant rations, they no longer do so. The man who now fails to take full advantage of the market his cows offer him makes a mistake. Until their maximum season requirements are provided for, it is folly for an owner of cows to put his grains on a market already flooded. Market conditions find the dairy farmer in a position of vantage, he should sell his feed through cows.

BUTTER PRICES FOR NOVEMBER

From the daily quotations of the United States Bureau of Markets, we have compiled the following table giving the monthly averages of the daily wholesale prices for November, 1919 and 1920, on 92-score butter (extras) in the four principal markets, together with the total receipts of butter at these markets for November:

	Av. price		Receipts	
	Nov. 1920	Nov. 1919	Nov. 1920	Nov. 1919
	cents	cents	tubs	tubs
Chicago	59.47	68.98	127,045	102,958
New York	63.26	71.24	139,145	203,799
Boston	59.75	68.59	31,710	55,802
Philadelphia	63.46	70.54	40,129	29,469
			338,029	392,028

These four markets show a decreased receipt of 54,000 tubs less than in November last year, which would seem to indicate a lowered milk production, as it is generally reported that many condenseries and some cheese factories have been turning their milk into butter. The total receipts at these four markets are also over a million tubs less for the first eleven months of this year as compared with last year, and it is reasonable to expect that these large markets are representative of all the markets in the United States. Cold storage holdings at these markets are now only a million and a half pounds (approximately 25,000 tubs) less than a year ago, which, to the novice at least, indicates a lowered consumption. The imports of butter can not account for much of this for the increase over last year in total imports and the decrease in exports to the present time can not be more than one-half to two-thirds the decreased receipts at the four principal markets alone.

These statistics seem somewhat confusing, but they do offer some opportunity for optimism as to the future butter market. The principal disturbing factor is a possibly lessened buying power on the part of the consumer and the general tendency of decreased prices for all commodities.

Ninety score butter averaged 53.88 cents for November on the Chicago market, with centralized butter at this market selling for 54.95 cents. Jobber's prices on extras sold to retailers during November averaged 60.98 cents in Chicago and 66.26 cents in New York.

PAYING FOR MILK BY TEST

Milk varies in comparison; therefore, it varies in food value. The richer the milk, the more valuable it is for making butter, cheese, and condensed milk. Butterfat alone may not be the best way to determine the relative values of milk, for there are other food constituents of milk besides butterfat and these should not be ignored.

If milk were to be paid for upon the exact basis of its food value, it would be necessary to take into consideration its fat and solid not fat contents. Paying for milk at a flat rate without regard to test leaves no inducement or incentive to produce the higher testing and more valuable milk. The richer the milk, the more cheese or condensed milk can be made and the more valuable it is as a food and it is not fair to pay the same price for 3% milk as is paid for richer milk.

Professor Hunziker says, in his third edition of Condensed Milk and Milk Powder: "As far as the condensery is concerned, it is entirely advisable to pay for all milk strictly on the butterfat basis. Milk rich in fat and, therefore, rich in solids, yields more condensed milk than milk poor in fat. To pay by the hundredweight regardless of quality is a practice which discriminates in favor of breeds of low testing milk against breeds of high testing milk." He could have said that this system discriminates against herds of the same breed, for the test of milk in the breeds varies materially. It is not wholly a breed question; it is a question of justice and of right. We do not believe in paying for milk at a flat rate, and the sooner it is paid for according to its test and food value, the better it will be for the dairy industry.

ELIMINATE POOR DAIRYMEN

There is no one factor that can account for all the ills of the milk situation. There are many influencing factors which could be enumerated. Not the least of the troubles are poor dairymen; men who will not read that they may act wisely in the conduct of their business and intelligently associate themselves with their fellow dairymen that they may market their products upon the proper basis. There is opportunity through educational forces to help most men engaged in dairying, but some are hopeless and should, like the poor cow, be eliminated.

It is a comparatively simple matter to weigh and test a cow's milk to determine how much she produces in a year, her feed costs, and profit above cost of feed. If she does not pay she can be sent to the butcher and there the story ends. But with the poor dairyman it is a different problem. His mind is so closed that there is no opportunity to get at him; he will not read or learn of his business; he will not treat his cows properly; he is out in the cold and refuses to come in by the fire and to be warmed. All he does is produce a surplus of milk which helps depress the market price of dairy products and buys so-called dairy substitutes, oleomargarine, because he thinks dairy products too expensive for him to use.

Such men as these should not keep cows, for it takes intelligence, a thirst for knowledge, to be successful in handling cows. Men who do not feel the desire for information had better let cows alone, for, while there is no quick or easy way of eliminating them from the dairy industry, there is a slow grinding and grueling force that will in time replace them with men who thirst for knowledge; who read and think. The poor cow keeper will then be eliminated, but by a most painful process.

BUY DAIRY CATTLE NOW

Temporarily unstable conditions have brought severe declines in the market values of dairy cattle. Recent auctions indicate a panicky feeling among buyers in most sections. A quality of pure-bred which sold for $500 a year ago, fails to net above $275 to $300 now and prices on grades have tumbled about fifty per cent. At some sales animals have gone at a sacrifice.

A decline in values of breeding stock and of grade milkers is in keeping with general financial conditions, but the severe depreciations registered at some auctions are not in keeping with sound dairy thought which looks ahead. This is the time to lay in foundation stock. The beginner can start in pure-breds now at prices lower than those seen in many months and which must surely make his purchases safe investments. It is a time when he can do the choosing; he is no longer forced to take what is offered. He must use discretion even now, it is true, but he overlooks such opportunities as have not been his in years when he lets high class breeding stock sell below their value. He must remember that a poor animal is always a bad buy, but his present advantage lies in the fact that good animals are now selling at prices within his reach.

There is no surplus of breeding dairy cattle; the need for superior animals was never greater or more generally appreciated. The future promises prices which will give profitable returns for money invested now in well bred animals of good conformation.

The coming months may bring further recessions in prices; the chance is just as great that improvements will come within a few weeks. Present values permit very advantageous selections; this seems to be a time to buy breeding stock for the future.

Corn and Cottonseed Meal for Concentrate Mixture—Obstructed Teat

I am feeding the following ration to my herd of Holstein cows: 27 lbs. good corn silage, 10 to 15 lbs. fine third cutting alfalfa at $25 per ton; free access to good sorghum hay ($12 per ton) during the day. I feed one pound of following mixture for every 3 lbs. of milk: 500 lbs. ground corn at $1.25 per hundred pounds and 200 lbs. of 43 per cent seed meal at $2.80 per hundred. Bran is selling here for $2.25 per hundred, ground oats $2.30, and ground barley, $1.65. Could you suggest any improvement on above ration?

One of my best cows seems to have a growth just inside lower part of teat which closes some so no milk can be drawn with the milking tube. My veterinarian suggested the use of elm plugs which we use a day or two, then the teat will milk good for a week but closes again. Milks good out of the quarter but very painful.

Colorado Springs, Colo. E. H. R.

There is a good basis for profitable returns from cows in the feeds listed. Alfalfa at $25 supplies nutrients cheaper than they can be purchased in most concentrates. We would feed alfalfa, therefore, as liberally as it will be consumed. Sorghum hay, while lower in nutrient content, is a very good feed and, at the price, is very cheap. It should be supplied in addition to alfalfa in as large amounts as the cows will clean up. By feedng 27 lbs. of silage per day in addition a basis for profits from milk is had.

The quotation on corn is unusually low. Ground corn at $25 per ton is so cheap a feed that a feeder is justified in making it supply a great portion of the concentrate mixture. Bran at $45 is higher priced than alfalfa and we would not use it. Oats is only a little better than bran and not enough better than alfalfa to afford it at $46. Barley is somewhat less valuable than corn and should, therefore, not replace it. If it is on hand, it will give good results with the corn, but is more costly.

The mixture of 500 lbs. of ground corn and 200 lbs. of cottonseed meal seems to us to be as good a one as can be made, provided it is not too heavy and sticky. Our inquirer might grind this corn,

cob and all, so that the corn and cob meal will lighten up the mixture somewhat. If he has only the corn meal and cottonseed meal together, he can mix these feeds with the silage so that they may not be sticky and be poorly masticated. If he can grind some alfalfa very fine, it will mix nicely with these two feeds. An allowance of one pound of the concentrate mixture for each 3½ to 4 lbs. of milk should be sufficient.

In such cases such as described, the tip of the teat becomes hard, horny, or wart-like in structure, and the orifice becomes so small that milking is made difficult. It would be best to disinfect the teat by immersing it in hot water, containing all the boric acid it will dissolve. Then apply etherized iodine by means of a sterilized teat bistoury. Cut down through the obstruction in four different directions. Milk then will come easily, but may spray. Strip away a little of the milk frequently during the healing process and use the boric acid solution twice daily. If a raw spot remains, apply twice daily a mixture of one part of balsam of Peru and three parts of alcohol. We do not think that teat plugs will suffice in this case. Such instruments may be bought from any veterinary supply house.

Starters, Pasteurizers, Neutralizers

Why should ripener milk be used and how is it used?

Does pasteurizing improve the quality of butter other than to kill possible germs? Does it have any effect on obtaining a proper overrun?

Why is pasteurized butter worth no more per pound than butter that has not been pasteurized, the score being the same in both cases?

What should be considered a good overrun, quality being first consideration? Is there any law governing overrrun in buttermaking?

If a pound of good butter has 80% fat, what per cent of moisture, salt, and casein should it have?

Is it possible to neutralize sour cream with pure lime (Allerwoods) and bring it down to a degree of acidity, where it can be mixed with sweet cream churned together and make a 92 score butter?

Is there any law that will prevent farmers or creameries from selling or receiving cream that is moldy or in advanced stages of decay?

Why does butter shrink in tubs in weight packed 63½ lbs. net delivered in Chicago 6 days old and then weigh out 58 to 60 lbs. per tub? The tubs are said to have been soaked in hot water and paraffined and liners and cloth circles soaked in brine 24 hours before butter is packed?

What per cent of protein is there in good buttermilk?

Is it a proper or healthy practice to neutralize sour cream with Wyandotte? Is Wyandotte anything but common soda potash?

Lone Park, Iowa. W. J. C.

Professor E. H. Farrington of the Wisconsin Dairy School has given the following replies to these inquiries:

"By ripener milk is meant what is ordinarily called starter or sour milk, which is added to cream for the purpose of controlling the souring of the cream, and by so doing developing satisfactory flavors in the butter made from such ripened cream.

"Whole sweet cream may be used for making a starter if desired, but the cream should be skimmed off before the sour milk is added to your sweet cream, as the sour cream on the milk may produce white specks in the butter because it contains lumps of cream that do not soften but separate with the buttermilk when this is drawn off at the time the churning is completed.

"Ripener milk or starter is commonly added to sweet cream. It will not have much effect on sour cream unless the sour cream is pasteurized for the purpose of destroying the ferments already developed by the souring process. In the case of pasteurized, sour cream, a starter may be added and good results obtained by so doing, but the best results are naturally obtained by adding the starter to sweet cream.

"The amount of ripener milk or starter ordinarily used in cream varies from 1% to 10%, and in 500 lbs. of cream testing 30% fat, I suggest that 20 lbs. of starter be added, provided the cream is to stand only about 20 hours before churning. In case a longer time before churning is taken, a smaller quantity of starter, say, about 2 lbs. ripener milk for each 100 lbs. of cream may be added.

"Pasteurizing the cream should improve the quality of the butter by giving it a more uniform flavor, which is obtained because the pasteurizing process is assumed to destroy all the fermentations present in the cream each day and if to such cream a carefully prepared starter containing a definite ferment is added each day, this should develop the same kind of flavor in the butter made daily.

"Pasteurization should not necessarily have any influence on the overrun obtained when butter is made, as the overrun is influenced by the carefulness of the buttermaker in saving all losses from waste cream and butter during the churning process and also on the percentage of fat in the butter made. This latter point is largely controlled by the temperature of the wash water and the amount of working the butter receives during this part of the process.

"While it may be true that butter made from pasteurized cream does not always bring a higher price than butter made from cream which is not pasteurized in the general market, I think there is on doubt but any creamery adopting the consistent practice of pasteurizing cream and using a carefully prepared starter will be able to produce a butter of uniformly high quality that will command a higher price than would be obtained at the same factory when the cream is churned each day without giving any attention whatever to pasteurizing it or using a starter. Some buyer will eventually notice the uniformly good quality of butter coming from a factory where the cream is pasteurized and on this account offer a higher price per pound for such butter, provided the buyer finds that he can depend on this uniform quality in the butter for any length of time.

"If the overrun from butter is calculated from the cream received, this overrun ought not to exceed 23 per cent. I think in the every-day work of a creamery it will probably vary from 21 to 23 per cent, depending on the carefulness of the buttermaker.

"The only law which has anything to do with the overrun in buttermaking is the one which requires a certain percentage of butterfat in the butter. If the standard of the law is 80 per cent fat in butter, then the overrun cannot possibly be over 25 per cent and if the law requires butter containing 82.5 per cent, then the overrun cannot be over 21 per cent.

"If a pound of butter contains 80 per cent fat, it may in addition to this fat contain 2 per cent casein, 3 per cent salt, and 15 per cent moisture. The per cent casein here given may be a trifle high, as it occasionally drops to 1 per cent and sometimes even less, while the per cent of moisture may be somewhat above 15 per cent, although it should never equal or exceed 16 per cent.

"It is possible to neutralize sour cream with lime and make a butter having a score of 92.

"The laws of different states vary somewhat in regard to the kind of cream a factory may receive and make the same into butter. I have no doubt the dairy commissioner of your state will be glad to give you definite information concerning the laws on this point.

"The shrinkage in weight of butter shipped to market or held in cold storage in 63-lb tubs, amounts to about one-half pound per tub. This is the shrinkage we have obtained by repeated trials at our Dairy School Creamery when the tubs are carefully soaked and lined with parchment paper before filling them. If there is a greater shrinkage than this, it is probably due to the tub standing in a very dry refrigerator after it is filled and the water evaporating from the wood of the tub, or the butter has a 'leaky' texture and a certain amount of brine leaks from the tub through the staves, or may be poured out from the tub when the butter is removed.

"The protein in buttermilk varies from 3 to 4 per cent. Buttermilk contains about the same amount of protein as skimmilk.

"I have never known of an instance where the washing powder mentioned has been used for neutralizing sour cream.

"You may doubtless obtain from the manufacturer of the washing powder mentioned, a statement concerning its chemical composition."

May we ask a favor of our readers?

Will you take just a moment's time — and glance at the address label on your paper?

And if you find these figures "Dec. 20" or "Jan. 21" on the label, will you please send us your renewal order — today?

1 year $1 3 years $2 5 years $3

Thousands of subscriptions expire between Christmas and New Years, and thousands of orders come to us at that time. That means hurry and hustle, and when orders come late, mistakes may happen.

If you want to do us a favor, and assure yourself of not missing a single issue of Hoard's Dairyman, mail your renewal now. Thank you!

Calves in Market Milk District

What is the best system of feeding high grade Holstein calves from time of birth until one year of age, where whole milk is sold and there is no skimmilk available?

Mt. Dora, Fla. R. C. S.

The question raised is one of very great importance in market milk districts. The common practice is to sell all the milk and fail to give calves the kind of a start which is necessary if they are to mature to the best producing animals. We have never seen a farm where calves raised without milk have made cows which were the equal of those which were given enough milk when youngsters to make them vigorous and healthy and growthy.

It pays to feed calves well; therefore, under any market condition, we would provide a milk supply. The best plan is to feed whole milk in any case for ten days or two weeks. After that, if the milk can be skimmed to save the fat, which is more valuable on the market than in the calf pail, that much is saved. If milk cannot be skimmed, we are very certain it pays to continue the whole milk supply to calves until they are at least four or five weeks of age. This is particularly true at this time, when milk prices are very much lower than they have been for many months.

Feeding may begin by giving calves six or eight pounds of fresh whole milk, from their own dams for the first few days if possible. Increase this amount very gradually until ten or twelve pounds are fed each day. By the time calves are three weeks old they will begin to eat a little hay.

A grain mixture should be placed before them so that they will very early begin to make some use of it. A very good mixture may be made from 200 lbs. of ground corn, 200 lbs. of ground oats, and 100 lbs. of oil meal. Some feeders prefer not to grind the oats. We would give as much of this mixture as the calves will eat until the time they are at least four or five months old, when it may be profitable to limit the amount of grain somewhat and force increased consumption of roughage.

Mixed hay gives a little better returns than alfalfa, or even the best grade of clover, since these hays tend to be a little too laxative when consumed greedily by calves.

Marsh Hay to Cows

Would you help me by formulating a ration from the following feeds? We have 11 Jersey cows. We have silage enough to feed 30 to 35 lbs. each daily, marsh hay for roughage. Should the cows giving 8 lbs. milk have as much silage as cows giving 20? We can get the following feeds: Gluten, $52 per ton; bran, $35; oil meal, $70; and oats, 60 cents per bushel. If the price of corn and barley are about the same, would it pay to buy some barley and mix in? At present we are selling our cream for 57½ cents per pound net for butterfat. We have to buy marsh hay from $5 to $8 per ton. Would it pay to buy alfalfa hay?

Redgranite, Wis. J. C.

While marsh hay is much less desirable in the dairy ration than a legume, such as alfalfa or clover, the price listed is so low that economical results may be obtained from feeding it in as large amounts as will be consumed. Ordinarily we would advise the purchase of alfalfa or clover, but it may cost so much that the use of this marsh hay in large amounts will be advisable. Supplemented with 30 to 35 lbs. of silage per day, it gives a fair basis for a dairy ration. Give this allowance to both dry and milking cows. To those cows which are producing milk, a concentrate mixture should be fed in addition. Corn is worth somewhat more in feeding cows than barley and, unless barley can be purchased much cheaper, we would use the former feed heavily. A mixture of 400 lbs. of ground corn, 200 lbs. of bran, 100 lbs. of gluten, and 100 lbs. of oil meal, fed at the rate of one pound for each three or three and one-half pounds of milk, should give very good results. The price quoted for oil meal is too high. It can be purchased cheaper. With butterfat at 57½ cents, a profit should be made.

Feb. 1-10—Mid-Winter Farmers' Course, Madison.

Feb. 1-10—Wisconsin Live Stock Breeders' Association, Madison. Geo. W. Davis, Secretary, Madison.

Feb. 4 & 5—State Live Stock Judging Tournament (roundup), Madison.

Heavy Declines in Butter Markets

[Report by U. S. Bureau of Markets.]

Failure of the butter markets to recover during the week ending December 4 from the sharp declines of the previous week was somewhat of a surprise to those who had expected an early reaction. Instead of a recovery the steadiness which marked the first few days of the week gave way on Friday to further weakness, and at the close on Saturday the tone was weak and unsettled in all markets with prices 5½c lower than the previous Saturday at New York and 3c lower at Chicago.

The only new factor contributing to the market weakness was the pressure of farther arrivals and offerings of Danish butter at New York. As long as buyers were willing to take top grades of domestic butter markets have held, but recently an increasing use of Danish make which could be had regularly at 6 to 8c cheaper than the top grade domestic has caused an accumulation of the latter on the markets. The policy of dealers toward the close of the week was to sell at any price which would interest buyers.

Moderate Storage Reduction

The rapid fall in values coupled with the continued money stringency has tended to make a bad situation worse on storage butter. The movement out of storage in distributing markets was very good during November considering the practical lack of exports, and the poor condition of the market. Reduction on the four large eastern markets amounted to 12,454,000 lbs., compared with a reduction of 18,839,000 lbs. last year. There is still a very large unsold surplus. At Boston the situation was reported as almost panicky. Most of the holdings, however, are in strong hands. Prices on storage butter have declined rapidly. It is reported on good authority that storage extras (92 score) were offered at New York as low as 48c. Prices around 46c on the Chicago market were rumored although some of this butter brought 50 to 51c early in the week. Canadian creamery butter in boxes sold on the Chicago market as low as 37½ to 38c. A low price of 30c was reported as having been accepted for some undergrade butter.

Week's Receipts Lighter

Receipts on the four markets were lighter than a week ago by some 5,000 tubs, but were heavier than a year ago. These light receipts on a declining market prevented losses to some extent, although conditions were such that some losses had to be taken by both shippers and receivers.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending December 4, 1920, and the corresponding week last year were as follows:

	Week ending Dec. 4 1920	1919
	Cts.	Cts.
New York	55.58	73.50
Chicago	51.53	71.70
Philadelphia	56.00	73.30
Boston	55.67	71.50
San Francisco	50.29	64.60

The receipts of butter at these markets for the week were 5,827,104 lbs. as compared with 5,430,083 lbs. a year ago and 6,065,074 lbs. a week ago.

Expect Lighter Cheese Demand Through Holidays

(Report by U. S. Bureau of Markets)

Reports from most quarters indicate a tendency toward dullness in cheese markets during the week ending Dec. 4. Business was not marketed by the same lack of confidence that attended trading in the butter markets, which suffered severe declines during the week, but the good substantial feeling of the past several weeks was noticeably missing. No doubt the heavy declines in butter were of influence in this connection, especially since a good many dealers who follow the markets had anticipated that the continued drop in butter prices would be checked before the low figures recorded the latter part of the week were reached.

Some dealers in Wisconsin attempted to stimulate trading by shading prices but little additional business resulted.

With quality of fresh cheese becoming less dependable held goods has met a better demand. There also seems to be more call now for cheese having a sharper flavor. Fancy held cheese is very firm and is moving out well to small trade. Fine early make is reported scarce. Export business is exceptionally quiet for present prices in Canadian markets are such as to attract whatever buying interest exists.

The average wholesale prices on American cheese (style Twins) for the week ending Dec. 4, 1920, and for the corresponding week last year, were as follows:

	Week ending Dec. 4 1920	1919
	cents	cents
New York	28.00	31.60
Chicago	25.50	31.38
Boston	25.83	32.70
San Francisco	29.41	30.20
Wisconsin Board	25.00	31.04

The receipts of American cheese at the four markets first given and at Philadelphia totaled 3,376,193 lbs., as compared with 2,881,732 lbs. a year ago and 3,026,240 lbs. last week.

Severe Declines Reported for High Protein Feeds

Market During Week Remains Inactive—Production Improves—Middlings Exceedingly Weak

[Report by U. S. Bureau of Markets.]

The demand for feedstuffs remained light during the week ending Dec. 4. Prices of linseed meal and cottonseed meal broke sharply. Heavy stocks and unsatisfactory export and domestic demand are given as the cause for the decline. Exports of these commodities to European countries decreased about 7,000 cars during the first ten months of 1920 compared with the same period in 1919.

Wheat feeds, especially middlings, were exceedingly weak. Increased flour production and the inability of a number of mills to obtain shipping instructions for December delivery contracts caused heavy offerings at lower prices. Buyers' bids were usually several dollars below prices quoted by mills and western jobbers. Minneapolis reports that a number of track cars of bran and middlings were sacrificed at prices considerably lower than prevailing quotations in order to avoid demurrage from accruing. Stocks of wheat feeds are reported to be heavy in principal markets.

Bran quotations were as follows: $26.50 at Minneapolis, $31 at Chicago, $32 at St. Louis, $50 at San Francisco, $39 at Atlanta, $37 at Boston, and $36 at New York and Philadelphia. Standard middlings ranged from $23.50 in Minneapolis to $28 at Chicago and $35 in Boston.

Offerings of cottonseed meal were heavy. In the Chicago markets, 43% meal was offered as low as $37 per ton. Several transactions, however, were consummated at a higher figure. Southern markets, due to the lack of improvement in financial conditions and mildness of the season, are reported dull. Quotation on 41% meal were $31 at Memphis, $33 at Kansas City, $35 at St. Louis, $38 at Chicago, $40 at Buffalo, $42 at Minneapolis and Boston. The 36% meal averaged $3 lower.

Linseed Meal Off in Northwest

While the price f. o. b. Buffalo remained unchanged at $40.50 to $41 per ton, northwestern mills reduced their prices to approximately the same basis. The demand has shown very little improvement due, it is maintained, to offerings of cottonseed meal at lower figures and heavy stocks of other feeds. All mills report heavy stocks. Other quotations are $44 at Chicago and New York, $45 at Boston, Philadelphia and St. Louis, $44.50 at Kansas City.

Offerings of gluten feed were light and demand good. Kansas City quoted $32, but majority were at $48 to $51. Hominy feed ranged from $30 in Omaha to $37 in Chicago and $43 in Boston. Alfalfa meal sold as low as $28 in Chicago and St. Louis. In Jacksonville velvet bean meal was quoted at $35 and 36% peanut meal at $50. Beet pulp was $45 in Minneapolis, $46 in New York, and $48 in Boston.

The hay market shows little change. No. 1 timothy ranged from $23 in Minneapolis to $38.50 in New York. Mixed hay sold in the same markets for $20 and $33, with clover at $20 in the former market. No. 1 alfalfa was quoted at $24 in Omaha, $27 in Minneapolis, $28 in Kansas City, $30 in Chicago, $23.50 in San Francisco, $35 in St. Louis, $32 in Memphis, and $38 in Jacksonville.

EMINENT'S DISTINCTION, JERSEY COW WHICH HOLDS THE SECOND HIGHEST RECORD IN VIRGINIA, 15 686.7 LBS. MILK, 802.03 LBS. FAT, MADE AT 11 YEARS, 7 MONTHS

OWNED BY BOWMONT FARMS

County Rivalry at the Cheesemakers' Convention

The growth of intense rivalry among the leading cheese counties in Wisconsin during the recent years in competing for prizes, and in making the largest and finest exhibits at state fairs, cheesemakers' conventions, etc., is one of the hopeful signs of the times in the industry.

At the coming conventon of the Wisconsin Cheesemakers' Association January 4, 5, 6, 1921, at Milwaukee, this intense county competition is likely to bring new leaders to the front. Altogether 175 prizes, valued at over $1,200, are listed in the new convention program, which is now being printed and will soon be mailed to every factory, by Secretary J. L. Sammis, College of Agriculture, Madison, Wisconsin. In addition, $800 in premiums will be distributed, and diplomas awarded for every cheese scoring 93 or above. One or more prizes are offered in every county in the state. These, with the special prizes for the leading county and the splendid state prizes and premiums, open to all, will undoubtedly bring out the largest cheese exhibit ever seen at a convention, and a special drive in all of the larger counties to carry off the leading honors.

We Learn From Work

1. That work is good for us.
2. That we should find our greatest happiness in it, and not in escape from it.
3. That the most salutory form of rest consists in change from one kind of useful work to another kind.—F. A. FALL.

FARM BUREAU FEDERATION MEETS

The permanent organization of the American Farm Bureau Federation was made in Chicago March 3, 1920. Its present paid membership is well over 1,000,000 with at least 500,000 affiliated members. Close to 1,000 farmers attended the Indianapolis convention December 6—8. Thirty-two states were represented.

The Federation is conservative in policy and national in scope and influence. It goes after big things and is accomplishing much toward bettering American agriculture.

FOREMOST of the considerations of members of the American Farm Bureau Federation, convened in annual session at Indianapolis last week, was the recent severe declines in market prices of farm products and the incident financial hardships to producers. The initial action of the convention was to telegraph Congress on the opening day of its present session asking that immediate provision be made for extensions and renewals of farmers' obligations, that an embargo be placed on importations of agricultural products in "destructive competition with American farm commodities", and that arrangements be made to open foreign markets for the exportation of agricultural products.

J. R. Howard, in reviewing the present market situation, estimated the loss to farmers in the recent price slump at more than $7,000,000,000 in the value of corn, wheat, and oats, and placed proportionate loss appraisals on other products. Mr. Howard said: "The wheat farmer is in the best shape today of any farmer in the Union . . . . and yet from the wheat growing districts every day reports to our office show that farmers are compelled, because of pressure brought upon them, to sell not only their crops but their machinery and everything they have to pay their debts. They are borrowing money to get into the cities where they can get work to support their families. Financial conditions will not be righted and American business will not be upon a sound basis ever again until the purchasing power of the farmers of America is brought back to normal."

Transportation, Marketing, Legislation Discussed

The three-day program was outlined to cover the transportation, marketing, and legislation work of the Bureau. The Wednesday discussions dealt with various methods in organization work.

TRANSPORTATION:—Clifford Thorne, representative of the Bureau on railroad rates, told of the work done seeking lower rates on farm freight, chiefly in reducing the railroad valuations which form the basis of present rates. Even though it appears that less was accomplished than was hoped, this work is credited by President Howard with securing sufficient reduction to net a saving of $100,000,000 to farmers annually. Henry Sherley of the Federal Highway Council called for assistance in working out a plan which secure permanent roads. Governor W. L. Harding of Iowa spoke of the benefits to middle western agriculture from a deep waterway from the Great Lakes to the sea through the St. Lawrence River, which he estimates will permit a saving in transportation costs of 5 to 7 cents per bushel between lake ports and Boston. Such a waterway would cost about $300,000,000, he says, and could be made a profitable investment by the government through developing hydro-electric power.

MARKETING:—In the marketing discussions main emphasis was given the need of credit provisions allowing the producer to store his crops and market them throughout the year rather than selling three-fourths of the total production in four months as now occurs. A. F. Lever, author of the Smith-Lever Agricultural Extension Act, submitted a credit scheme in which warehouse receipts of insured storages of non-perishable farm staples can be used for credit. "What we seek to do," said the speaker, "is to pool warehouse receipts, representing tens of millions of bushels of wheat or corn or oats or barley or pounds of wool or cotton into the hands of trustees to issue against them short-term certificates to be offered for sale to the investing public." He charged the Federal Farm Loan system with failing to furnish the credit support to farmers it should, but held that the system can be changed to be of much benefit.

Willis H. Booth of the Guarantee Trust Company explained the plans for organizing a banking corporation to aid exportation, which would improve the market situation by relieving it of the present surplus. The Bureau accepted his invitation to send representatives to meet with bankers in Chicago December 10 and 11 to consider such an organization.

Contrary to the general feeling throughout the convention that the Federal Reserve Bank has been too severe in its application of deflation measures to agriculture, Gov. W. P. G. Harding of the Federal Reserve Board declared that liquidation has been much more marked in New York City banks than in sections serving agriculture directly. He predicted the early completion of arrangements for foreign sales which will take care of staple products at better prices.

Dean Eugene Davenport gave a general survey of marketing conditions, emphasizing the losses the farmer incurs through marked fluctuations in price. He called for, "Steady prices, not necessarily high prices", and pointed out the Bureau's opportunity as a stabilizing factor. Milo D. Campbell characterized the American farmer as a 1920 John Alden and said the hope of the future of agriculture is that farmers are now ready to "speak for themselves", that through such organizations as the Bureau "we are now ready to have a word with Priscilla for ourselves".

LEGISLATION:—The work of H. C. McKenzie, New York, as chairman of the Bureau's committee on taxation, has brought such results as led President Howard to say: "I consider that he has done a greater piece of work for American agriculture during the past year than has been performed by any other one individual". Mr. McKenzie in his address called for a strong stand against the effort to substitute a tax on sales for the present excess profits tax. Such a change, he holds, would saddle the chief burden of taxes on the consumer instead of levying it upon the organizations making large profits as at present. The sales tax when paid by institutions not making a profit is a tax on capital, which the speaker asserts has been proved unsound. He declared for a reduction of surtaxes and a constitutional amendment doing away with tax-free securities.

The Bureau seeks temporary relief for farmers in an embargo on agricultural importations, as stated in its resolution to Congress, and for tariff reform, so that the farmer has "the same consideration in tariff matters as industry gets", which is "the least we ought to be satisfied with".

DIRECTORS OF THE AMERICAN FARM BUREAU FEDERATION

Left to right, top row: John T. Burton, Utah; J. W. Morton, Georgia; J. W. Coverdale, Iowa, secretary; H. E. Taylor, New Jersey; middle row: Dr. A. C. True, Washington, District of Columbia; C. H. Gray, Missouri; D. B. Cornwall, Vermont; E. F. Richardson, Massachusetts; bottom row: O. E. Bradfute, Ohio, newly elected vice-president; S. L. Strivings, New York, retiring vice-president; J. R. Howard, Iowa, president; Gray Silver, West Virginia; at the extreme right, W. H. Walker, California.

A Full Measure of "Resolves"

The convention put over a full measure of resolutions—to a total of thirty, these being adopted with less time for close consideration than many delegates desired. Among these "resolves" it is recommended that the Bureau give attention to the need for rural personal credits and taxation questions, the Department of Justice was requested to delay plans for the disposition of the stock yards until the Bureau's committee can make its examination, our incoming president was requested to appoint as Secretary of Agriculture a man of "thorough and practical understanding of farming", an amendment was demanded increasing the Federal Farm Loan Act limit to $25,000, sympathy with the laboring man was expressed and unalterable opposition to strikes and lockouts, preferential rates were asked on limestone and fertilizers, the preservation of state power to regulate carriers in intra-state shipments was demanded, the basis for fixing return of railroads on cost-plus basis was denounced, and a truth in fabrics law and a simplification of the income tax law were demanded from congress. The resolutions declared the farmer is entitled to compensation for his services equal to actual cost of efficient production, that a law permitting collective bargaining should be at once enacted, that legislation should be passed to prevent short selling in agricultural products, that the Bureau favors a Great Lakes-to-the-sea deep waterway, and that a tariff law should protect American farm products against those from countries where land is cheap and living conditions low.

Thirty-two States Represented

Thirty-two states were represented by delegates at this second annual convention of the American Farm Bureau Federation meeting. In these states the organization now has well toward one and a half million members. The Federation is now "both in financial support and in number of members the strongest organization of farmers which has even been built up in this country". About one thousand attended this convention and came to fuller appreciation not alone of the great work the Federation is already doing but also of its potential influence in bringing about the improvements which shall measure the future of American agriculture.

President Howard outlined the present activities of the organization and laid before the meeting the plans now under way for enlarged undertakings. If an undercurrent of pessimism regarding present agricultural conditions was noticeable among the members, there was no such feeling relative to Bureau affairs. The general sentiment was for conservative progress which will bind the organization closely together and enable it to serve agriculture in a large way.

Officers Elected

J. R. Howard was re-elected president by a unanimous vote and given a hearty ovation. In his acceptance remarks he said: "I cannot promise you more than I have given. I have done my level best and will continue to do my level best. The results we have obtained have come through the co-operation you have given me. I ask—I expect a continuance of that co-operation."

A lively contest for the vice-presidency began early in the session. John G. Brown, president of the Indiana Bureau; Howard Leonard, president of the Illinois Agricultural Association; and S. L. Strivings of New York, who held the position during the past year, were contestants. A compromise turned the supporters of the first two to O. E. Bradfute of Ohio. Only Mr. Strivings and Mr. Bradfute were nominated, the latter being elected.

Directors chosen were: for the far western section: W. H. Walker, California; W. G. Jamison, Colorado; and John T. Burton, Utah; for the eastern section, E. B. Cornwall, Vermont; E. F. Richardson, Massachusetts; and H. E. Taylor, N. J.; for the central section, Howard Leonard, Illinois; John G. Brown, Indiana; and C. H. Gray, Missouri; and for the southern section, Gray Silver, West Virginia; Jas. W. Morton, Georgia; and J. T. Orr, Texas.

In session December 9, the executive board re-appointed J. W. Coverdale secretary and gave him charge of organization work. C. E. Gunnels was re-appointed as assistant secretary and given duties as treasurer. Departments of co-operation and publicity were created. A dairy marketing conference was authorized for a date late in January, 1921.

For Mother From Daddy and the Children

Everywhere the tubs and the washboards are being discarded. Women are thinking more about their own health and comfort. Menfolks are showing more interest in labor-saving devices for the home.

Especially at Christmas time is this interest strongly manifested. For example, hundreds of Maytag Washing Machines will be given to mothers this year for Christmas. Why not you?

If your home is without electricity, the Maytag Multi-Motor Washer is a godsend. Gives all the advantages of the electric washer and many of which no electric can boast.

A wonderful little air-cooled gas engine—a part of the washer—operates it. Will do your biggest wash anywhere—because it is a complete outfit. Use it in the cellar or kitchen—in the shed. A long, flexible metal exhaust pipe carries all the smoke and noise outdoors.

For Homes with Electricity

The Maytag Wood Tub Electric Washer is identical with the Multi-Motor except that it is operated by an electric motor. You merely hitch it up to an electric light socket—turn the switch and it's on the job. Can be used with any kind of current including farm lighting plant.

Has an electric wringer adjustable to three positions. Wrings from washer into rinse tub—from rinse tub into blue tub and from blue tub into basket without moving the machine. Wrings forward and reverse.

The Maytag Multi-Motor handles heaviest pieces in quick time. Saves you the hard work. All you do is feed the clothes through the power wringer and hang them out. Costs only a little to buy and practically nothing to operate.

Maytag

Electric and Gas Power Washers

The Maytag Company, Dept. 105, Newton, Iowa

Branches at Philadelphia, Pa.; Indianapolis, Ind.; Minneapolis, Minn.; Kansas City, Mo.; Portland, Ore.; Winnipeg, Man., Can., and The Maytag Company of England, 323 Caledonian Road, King's Cross, London.

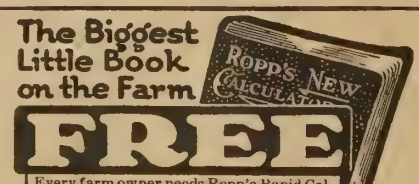
Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.



Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

Danish Butter Competes With Medium Grades

Total Imports of Foreign Butter for First Nine Months of 1920 More Than 28 Million Pounds

Imports of butter into the United States during the first nine months of this year, from January to September, inclusive, totaled 28,186,993 lbs. Of this quantity Denmark led in supplying 14,367,127 lbs., Canada and Argentine following with 7,393,702 lbs. and 3,078,437 lbs., respectively. The remainder came principally from Holland and New Zealand.

Because of the generally high quality of the Danish butter much interest has followed it in domestic markets. It was at first believed that this product would come into direct competition with the finer grades of American butter. However, while its quality has compared favorably with the better domestic make such competition has not resulted, but rather the Danish butter has competed with medium domestic grades, scoring 89—91 points.

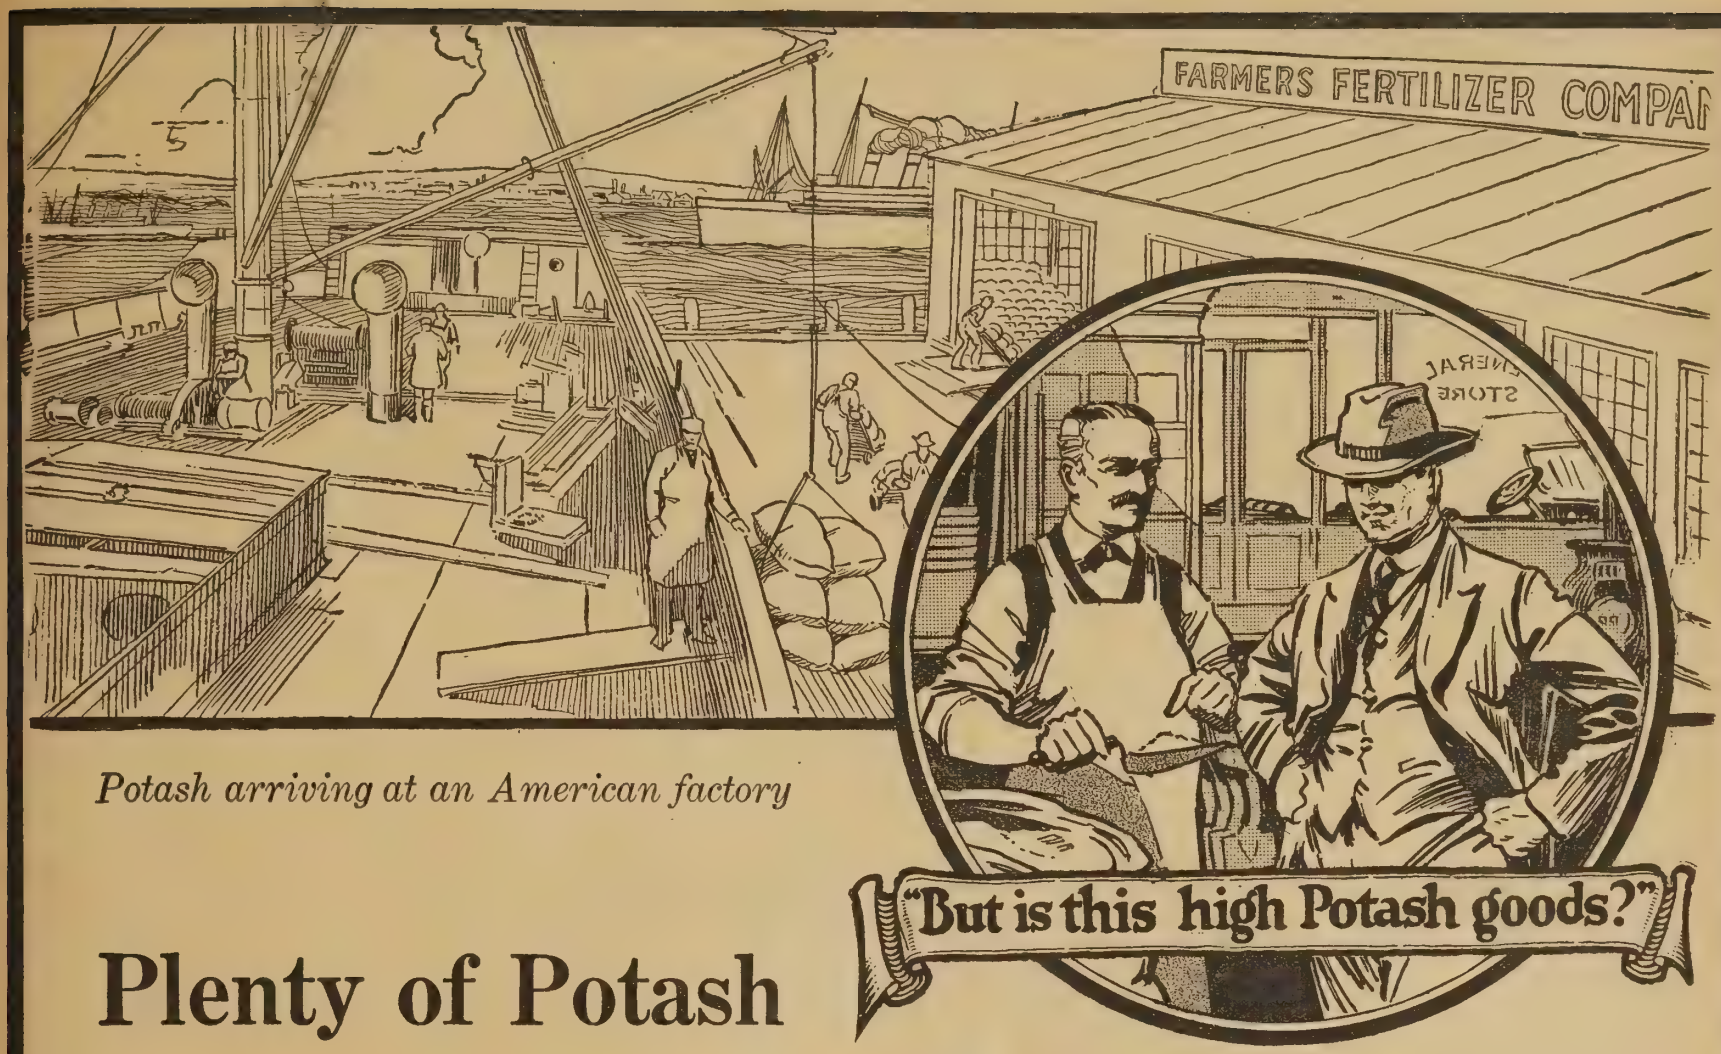
Danish Package Not Always Popular

Of the several factors which have been responsible the package is outstanding. Most of this butter has found its way into the New York market which is highly specialized, and where the Danish style of package is not entirely satisfactory when the butter must be resold. Retailers who sell from the package and who have refrigerators equipped for the standard tub or cube object to the cask. The cask is not such a disadvantage to the distributors who cut up and print butter for their own trade, although it involves more work in handling and is not a package which can be disposed of to advantage after being emptied.

The principal outlet for most of the Danish butter has been to a class of trade accustomed to taking butter at prices considerably under the price of fancy goods. The result has been that many consumers who heretofore have been using medium and undergrade butter have become accustomed to the finer qualities of Danish butter and this at prices which would correspond to those paid for 89 to 91 score domestic. Whether or not these consumers will continue to demand equally fine quality will depend on current prices, also upon the ability of American creamerymen to improve the quality of American butter so that there will be enough fine butter to supply the demand without causing such wide spreads between fancy and medium grades as have typified markets this fall. It is hoped that a better demand for quality will result and that American creameries will be able to supply markets with ample quantities of fine butter. A review of butter prices the past few months will indicate how much more profitable it has been to market fancy butter than undergrades.—U. S. Bureau of Markets.

Cheese Prices for November

Cheese prices during November held fairly well to their October rate. For the eleven months ending November 30, 1920, the total receipts of American cheese at Chicago, New York, Boston, and Philadelphia totaled 148,067,183 lbs. as compared with 176,475,747 lbs. during the corresponding eleven months of 1919. This is a decrease of 28 million pounds, the month of November accounting for two million of this decrease. The cold storage holdings at these markets are also eight and a half million pounds less than a year ago, with exports for the year somewhat in excess of what they were up to December 1 a year ago.



The daily quotations of the U. S. Bureau of Markets show the following average quotations on cheese (style Twins) for three large markets in November, 1920 and 1919:

	Average price	
	November 1920	November 1919
	cents	cents
Wisconsin Boards	24.47	30.89
Chicago	24.52	30.74
New York	26.88	31.49

Longhorns averaged 26.10 cents on the Wisconsin Boards for November as compared with 25.39 cents for October.

Potash arriving at an American factory

Plenty of Potash

AFTER five years of Potash famine there is now plenty of Potash to be had at prices that will permit it to be used at a good profit.

When Potash in mixed fertilizers was sold at five dollars per unit, everybody exclaimed that the price was "prohibitive". This was a state of mind. As a matter of fact, when the records of long continued experiments east, south, and west, were carefully gone over it was found that there were plenty of cases where the crop increase from the use of Potash on corn, wheat, oats, cotton, tobacco, potatoes, vegetables and fruit returned over five dollars per unit, even valuing the crops at prices current before 1914.

Now prices of Potash are less than one-half of these "prohibitive prices" and prices of farm products are still high enough to make the purchase of the five to ten per cent. Potash fertilizers a very profitable investment when yields alone are considered.

But this is not all. The shipping and keeping quality of many of our truck, fruit and special crops has suffered from lack of Potash.

Plant diseases have increased for the same reason.

Our best lands have been overworked to the limit and need restoration.

The fertilizer manufacturer who really has the foresight to understand that he serves his own and his customers' interest best by furnishing what his community really needs will return to the formulas that were found most profitable for his community before the Potash famine upset things. Indeed this is putting the case mildly, for provision should be made not only to restore the old high Potash formulas, but to use additional Potash to restore the drain on the soil during the past five years.

We never advised the use of Potash on soils where we had reason to believe it would not prove profitable, and never shall do so.

There is not a single crop on which Potash has not been found profitable on many types of soil.

In the readjustment period when farmers must use every means to assure success it is of the utmost importance that they should not be turned aside in their efforts to buy fertilizers with a reasonable (five to ten) per cent. of Potash.

Potash Pays

and after five years of Potash famine it will pay better than ever.

It takes time to produce and ship Potash and large stocks are not carried at Potash works.

Therefore it is imperative that you notify your dealer at once what brand of fertilizer you will require and that you should not be induced to change your order on any claim that the right kind of goods cannot be secured. Stick to it and you can get what you know you want.

Cheese Producers of Wisconsin to Federate

A PLAN for the cheese producers to get control of the marketing of their product, and to organize the Wisconsin Dairymen's Storage Co., has been adopted by a nearly unanimous vote of the stockholders of the Wisconsin Cheese Producers' Federation at a special meeting on Nov. 23rd, 1920. This plan has been endorsed by the Division of Markets of Wisconsin; the Economics Department of the University of Wisconsin; the Farm Bureau Federation and others.

It is contemplated to get the majority of cheese factories as soon as possible to join the Wisconsin Cheese Producers' Federation, which for nearly seven years has been marketing the cheese of its members successfully and at a very low cost. This fact was determined by the Division of Markets of Wisconsin and by the Economics Department of the University of Wisconsin who made an investigation of how the business of the Federation has been conducted. That the Wisconsin Cheese Producers' Federation has been successful is shown by its steady growth, as the following figures will show:

Year	Pounds cheese	Value of cheese sold
1914	6,125,480	$ 887,501.00
1915	7,558,796	1,132,867.00
1916	7,490,020	1,304,640.00
1917	8,981,308	2,171,526.00
1918	8,522,509	2,322,536.00
1919	14,098,021	4,319,956.91

During this time the farmer members of the Federation have been paid the Plymouth board price, which is all that the farmers outside of the Federation get, and in addition to that they have built and paid for a warehouse and storage which with ground and equipment could not now be replaced for less than $70,000. Over and above that more than $42,000 has been paid out in dividends or deferred payments and more than $38,000 remained in the treasury January 1st, 1920, making in all $150,000 Federation members were to the good at that time.

However, the protection against price manipulation, especially during the summer months when the most cheese is produced, has amounted to many times the surplus. There is no longer the great difference between the summer and winter prices that there formerly was.

The Federation is no longer an experiment. It is recognized as being one of the most successful examples of farmers' co-operation in this country.

A great deal of money, time, and effort has been spent to increase the production of dairy products, but little or nothing has been done to improve marketing conditions of the same. It is absolutely necessary that dairy producers combine in the marketing of their product in order that they realize fair returns on the product of their cows.

In their report the Division of Markets and the Economics Department of the University of Wisconsin say:

"The Wisconsin Cheese Producers' Federation is one of the most successful and commendable examples of farmers' co-operation in the United States. * * * The experience of the Federation indicates that Wisconsin farmers have a great opportunity before them in the building up of a strong, unified co-operative cheese producers' selling organization. The Federation has shown that it knows how to sell cheese, and to keep the costs down. * * * All it lacks is the size of business. What it should have is more cheese. If Wisconsin farmers provide the volume of business this Federation, because of what it now does and will do for its patrons, is destined to rank in the class with the California and Canadian farmers' co-operative concerns."

The only way in which the producers can have anything to say about prices is through an organization of this kind, large enough so that it controls the marketing of the cheese produced in Wisconsin. These prices are now fixed on the Plymouth board by the agents of the five big packers who have nothing to do with the production of cheese, and who many times fix the board prices regardless of supply and demand, and regardless of the cost of production.

The easy money in the cheese industry in the past has not been in the production of milk to be made into cheese, but it has been in the marketing of cheese, and it is time that the farmers who produce the cheese get some of this easy money.

In order that the Federation as it grows larger may be in position to properly handle and market its cheese, it was decided to organize the Wisconsin Dairymen's Storage Co. with a capital stock to begin with of $250,000, the common stock of which need only be a nominal sum, say $2,000. This common stock is to be the voting stock, owned by the Federation, and held in trust for the Federation by its board of directors; the balance to be preferred stock; this stock to have no vote, and to draw 6 per cent interest guaranteed by the Federation; the preferred stock to be divided up into shares of $50 each, and to be sold to anyone, preferably farmers.

While this preferred stock has no vote nearly all of it will be held by farmers who are Federation members, and they will control the Storage Co. through the Federation. As soon as enough stock has been sold this storage company plans to take over the warehouse which the Federation owns at Plymouth; also to take over the Spring Green warehouse, and to build or buy warehouses where needed. Practically all the money that farmers will invest in this warehouse stock will be invested in buildings, grounds, and equipment. The organization expenses will be kept at a minimum, as this is not a stock promoter's scheme. The storage company will take over the Plymouth and Spring Green warehouses at book value, which is much below the actual present value.

If the farmers want to go into the business of marketing their cheese they must finance their organization and provide warehouse room. Very few farmers would hesitate to invest several hundred dollars in a granary to house what little grain they are now growing, and there can be no reason given why they should hesitate to invest that amount of money in a cheese warehouse association when the value of their cheese amounts to much more than the value of their grain, and when they are guaranteed 6 per cent interest on every dollar they invest in warehouse stock.

Dairymen must directly or indirectly pay for cheese storage houses and their upkeep, and they might as well own and operate them.

Subscription blanks for Storage Co. stock will be sent to the officers of every local association, and they will be requested to circulate them among the patrons of their factory and others and get all the subscriptions for stock they are able to get. In this way the organization expenses will be kept at a minimum.—Wisconsin Cheese Producers' Federation.

London Dairy Show

THOMAS REECE, ENGLAND

THE London Dairy Show of the British Dairy Farmers' Association, held this year at the Royal Agricultural Hall, was most successful. It was the 42nd show and on the popular days was quite inconveniently crowded. Cattle entries numbered 384, a figure substantially above anything in recent years.

The results in the inter-breed competitions at the last two shows have quickened rivalry in the milking breeds of cattle. Last year the honors went to the Red Polls; at the recent show the British Friesians made a clean sweep of the cups and other championship trophies.

Enterprising supporters of the British Friesian are naturally jubilant at the successes gained by their breed. Their efforts in pushing it will be helped greatly by the addition of these important honors to records in private performance already arresting attention. The value of Dairy Show successes, especially to a breed more or less local or new to the great body of farmers, was exemplified in the case of the Red Poll last year. The hornless reds of East Anglia were beginning to make fresh ground outside their native district before their victories, but the impetus which their milking performances in the fall of 1919 gave to their progress was instantly marked, and in a few months raised the breed to a prominent position in dairying districts in many counties. The results of the recent achievements of the black and white cattle of Friesian origin will not be less effective in gaining new supporters for them.

The milking and the butter tests were exceedingly high. Greater importance than ever was attached to the performance of the cows at the milk pail. The association adopted a different plan of management. In past years the result of the milking trials and butter tests has not been available until late on the last day of the show, while cattle were judged by inspection on the previous Tuesday. This year the trials and tests were taken earlier, with the result that the yield of each cow was available for the judges when the inspection classes were paraded. In these days, when increasing importance is attached to the quantity of milk given, the innovation is an advantage and, furthermore, as the amount of milk given by the exhibits was shown over their stalls it enabled the general public to form some idea as to the quantity of milk produced by the best cows in this country.

As is customary, a large number of special prizes and cups were offered in this section. The Spencer Challenge Cup is offered for the best dairy cow in the show, that is, a cow gaining the greatest number of points by inspection, milking trials, and butter tests. This cup went to A. and J. Brown's Hedges Sweet Buttercup, British Friesian, which in the butter test gave 57 pounds, 4 ounces milk in 24 hours, with a yield of 2 pounds, 8 ounces butter. Reserve to her came the Shorthorn cow, Ruby, belonging to J. T. Nelson and Co. who, with a rather less milk yield amounting to 49 pounds, 13 ounces in 24 hours, yielded 2 pounds, 11¼ ounces butter.

The Bledisloe Cup for the cow gaining the highest points above the standard of her breed was awarded to W. and R. Wallace's British Friesian cow, Inwood, the reserve in this instance going to the Duchess of Albany's Jersey cow, Hartsfield Venus, while the Desborough cup for the cow gaining the highest points in the milking trials was awarded to Mr. Palmer's Rosebud 14th, with Sir C. C. Allom's Hadnock Mignon Daisy 5th reserve, both of these being of the Shorthorn breed.

The Barham Cup for the cow gaining the greatest number of points in the milking trials resulted in another win for Messrs. Wallace's Inwood, the reserve in this instance, as well as the winner of the Shirley Cup, being G. Holt Thomas's Cymric Cheeky. The Stagenhoe Challenge Cup for the Guernsey cow or heifer gaining the greatest number of points at the show was awarded to the Duchess of Albany's Hartsfield Venus. The Kerry and Dexter Challenge Cup confined to cattle of these breeds was won by J. W. Towler's Gort Drop 6th, reserve Captain Nelson Zambria's Minley Mistress.
